THE BUILDING NEWS
AND ENGINEERING JOURNAL.

ST. MARYLEBONE PUBLIC BATHS AND WASHHOUSES COMPETITION.

THE Commissioners of Public Baths and Washhouses of St. Marylebone have, with the assistance of Mr. Chas. Barry, F.R.I.B.A., the assessor, selected three designs for the rebuilding of their baths and washhouses in the Marylebone-road, and these have been on view at the existing baths. The designs, placed in order of merit, are, as we mentioned last week, for the first premium of £100, the plans by Mr. John Johnson, of Queen Victoria-street, "No. 24"; for the second premium of £60, the plans of Mr. A. Saxon Snell, Southampton-buildings, "No. 25"; for the third premium, of £40, the plans of Messrs. Arthur Ardron and Henry Cheers, Victoria-street, S.W., "No. 23." The site is a very irregular one, without any square angle, and considerable ingenuity was required in arranging the baths, approaches, and administrative building. The old "Pompeian" first-class men's swimming-bath fronting Seymour-place had to be retained, though alternative schemes for altering its position at the option of the competitor were invited. Rights of light and air of adjoining owners had to be observed, and the Marylebone-road frontage could be brought out to within 50ft. of the roadway. The authors were required to add a gallery at each end to the existing men's first-class swimming-bath, for the accommodation of spectators at swimming entertainments, by removing the end walls above the pilasters, and utilising the space behind them. In one of these, 30 lockers for undressing were to be provided, and the space arranged as a club-room. Also, to rearrange the waiting-room, pay-office at entrance, &c., and to provide the following. A men's second-class swimming-bath, not less than 66ft. by 21ft. (water dimensions), was to be provided for 60 dressing-boxes, with overflow, tiled boxes, subways, attendants' rooms, outlet and inlet pipes; a men's third-class swimming-bath, not less than 66ft. by 21ft., with about 60 boxes, tiled footway and boxes, &c.; a ladies' swimming-bath, with water dimensions 60ft. by 25ft., for 35 dressing-boxes; 24 men's first-class and 55 second-class private baths, besides two vapour-baths; 10 ladies' first-class and 19 second-class—in all 110 private baths were required, in addition to a public laundry for 80 washing-boxes, 80 drying-horses, a large ironing-room, house-laundry, and residence for superintendent and matron, &c. The engineering requirements were numerous, and required considerable practical knowledge of the economical working of these establishments. Thus a tank to contain 60,000 gallons of water, and a large boiler-house to hold four large steel high-pressure boilers, each 30ft. long by 7ft. 6in. diameter, a horizontal steam-engine, circulating pipes for heating, and fireproof construction were to be provided, and the instructions have been very skilfully prepared by Mr. O. L. Marchant, the clerk to the commissioners. The very irregular boundaries have exercised the ingenuity of the competitors. The selected first two designs show their authors have studied the external arrangement of the main baths in arranging the walls at right angles, and have thrown the inequalities into the light and air areas. For baths, the question of entrances is always a vital one, if economical working is to be kept in view, and it is better that all the classes of bathers should have one spacious entrance with a pay-box in a prominent position, than that there should be two or three separate entrances and pay-boxes, and the same rule ought to be observed as to corridors, and waiting-rooms and stairs.

The first premiated design, by Mr. John Johnson, is an unquestionably good plan, and we think the commissioners—with the skilled advice of Mr. Marchant, their superintendent, and the professional opinion of their assessor—have justly awarded the first place to No. 24. There are points of detail in the plan and construction which do not quite satisfy us, such as the lighting of the front block and the corridor at side of Pompeian bath; but, taking the general principle of the plan, the main entrances, the utilisation of the space, the good arrangement of the passage for bunkers, the author has been very successful, and has produced an economical scheme. The front block, facing Marylebone-road, has a central entrance for all three classes of bathers, with one pay-box in the centre between the two main doorways. On the left side is a ladies' waiting-hall, adjoining their first-class private baths, and a direct access to their swimming-bath, 63ft. by 24ft; on the right-hand side, corresponding, is the second-class men's waiting-room and entrance to their private baths. A central staircase opposite box-office gives access to second and third-class swimming-baths in the basement in front, and in a line with the stairs is a grand centre corridor to the Pompeian first-class men's swimming-bath, 100ft. by 25ft. in the present position. The men's second and third-class plunge-baths are 80ft. long, and are partly under the front building. The superintendent's entrance is on the right-hand side. On the first-floor plan 24 men's first-class private baths are placed, half over the washhouse; the side wall being carried by iron columns, a constructional expedient which seems to have been unavoidable. Ladies' second-class private-baths for 20 are arranged parallel to the Pompeian bath on the top floor, overhanging the area for light, and rather darkening the corridor below. The front part of building is devoted to the commissioners' and superintendent's rooms, a better position than that under the roof, and more convenient. The skylights shown in the plans are more correctly floor and borrowed lights, and look scarcely sufficient for the amount of light necessary. The elevation to the main road is a florid Italian façade, with an arched centre and domical roof. The estimated cost is £37,500. The drawings are very carefully executed, and the details of the engineering fairly well considered. In this connection we may call attention to the insufficient provision of means for introducing or replacing boilers observed in one or two of the plans. Four large steel high-pressure boilers 30ft. long and 7ft. 6in. diameter require means to be provided should occasion be necessary for their removal, without requiring any great opening to be made in the walls. According to some of the authors, they would have to be placed in position before the basement walls were fully built up.

The design placed second, by Mr. A. Saxon Snell, is also an able plan, and displays much practical acquaintance with buildings of this character; the plans, sections, and details have been very thoughtfully prepared and clearly drawn. The author retains, but lengthens and improves, the present men's first-class (Pompeian) bath, the men's second and third-class swimming-baths are placed at the Marylebone-road end in the basement, but at right angles to the existing ones; the first is 67ft. by 24ft. 6in., and the latter 65ft. by 24ft. 6in. water dimensions; the dressing-boxes are on three sides, and a bridge and diving-board at one end is shown to each. The ladies' swimming-bath, 60ft. by 24ft., is placed transversely across the widest part of site occupied now by the men's first and second-class and ladies' private baths, and next to this, adjoining the Pompeian bath, is the boiler-house. The ladies' swimming-bath has a gallery with top-light lantern roof, and is well placed between the administrative and public washhouse blocks, these being carried up three stories. There is much ability shown in the plan in the economical utilisation of space; but the author has devoted a wide central and prominent entrance in the Marylebone-road front for the commissioners and superintendent, and the first-class women and men bathers, and has cramped his second and third-class men's entrances at the extreme ends of the front. This division of entrances, besides entailing extra pay-boxes, spoils an otherwise clever plan. The central prominent position is given up to a commissioner, who will seldom visit the establishment, and the centre hall is taken up by the superintendent's stairs, so that the first-class bathers will have to pass right and left by the board-room and superintendent's office to their respective box offices and staircases to the baths. If the central position had been entirely given up to the bathers of all classes, and a side narrower entrance provided for the officials, less room would have been wasted and direct entrance insured. The board-room and superintendent's room are lighted through large openings in the front wall of offices, and their own windows being set back they would be somewhat dark. The upper floor is cleverly managed, the staircases in front lead to women's first and second-class private baths, and to the men's, leaving two open areas, which give light through lanterns to the washhouse and ladies' plunge-bath. The public laundry and ironing-room are well placed and ventilated, with convenient access from the rear entrance at side of Pompeian bath, and the lantern over public laundry has a Blackman's fan. The waiting-rooms to the private baths are convenient, and the area generally has been economically utilised. The basement plan shows the drainage and subways. The elevation is of red brick, relieved by stone or terracotta dressings and bands; it has rusticated quoins, and the central portion of offices is carried up higher than the wings. The treatment is a Free Renaissance. The estimate is £42 000.

The third plan (No. 23) is less economical than either of the other two. The entrances are less direct; that to the men's 1st class swimming-bath is by a long inclined corridor, the oblique lines of boundaries are followed in the building, and the washhouse and ironing-room form a large central top-lighted area of the buildings. On the first floor the men's first-class private baths, 92ft. by 25ft. 6in., are located on the western side, and the women's in front at the eastern end, their second-class baths being placed at the end of Pompeian bath opposite Seymour-place. We notice on the men's third-class swimming-bath only three gangways are shown, and the position of the boilers in the basement is rather awkward of access. The main front to the road is an elaborate treatment in the Renaissance style of red brick and stone, with two ornamental gables, and the estimate is £31,000. We have had no time to look at the other twenty-three designs, a few of which are creditable; others fail in the laundry arrangements, by placing it in the upper floors, or in the matter of entrances and details.

ORGANISED DESIGN.

COPYING and competition work have accomplished a great deal for architecture in the past, when its mission was not so wide nor so various. It was well that a period of patient copying imbued men of the last generation with ideas of old work, kept them for a time in guiding-strings, showed them what the Athenians and the Romans and the Mediævalists had done for art, and gave the world such pioneers as the Brothers Adam, Josiah Wedgwood, and Augustus Welby Pugin. We should never have done so much as we have, had the early years of the century been spent in attacking new ideas and construction, and in trying our hands at new problems of design. The era represented by the art of 1840 was indeed one we all look back to without any pride; both architecture and its subsidiary branches were at a low ebb. Those of us who have lived long enough to recall our works of that period cannot do so with any enthusiasm. We are glad to say little about either our Ecclesiastical or our Domestic work; we feel rather ashamed to open our old dusty portfolios and bring to the light of the present day our designs and drawings of executed or unexecuted work. Would they were all in the latter category! But bad as they are, they represent the general taste of the age. There is, indeed, one great work of that era we look back on in wonder, sometimes in admiration, and this is the work largely of a man who lived in that very age—we mean Pugin. In the Houses of Parliament, as Mr. J. D. Crace said the other day, we may walk through and wonder that the woodwork, carving, stained glass, metal-work, tiles, and furniture were actually done in the few years following the date we have named. Yes; and they were all done in the midst of the general ignorance of artistic principles and feeling, and mainly by one man imbued with the true inspiration of genius. We owe indeed a vast deal to his teaching and to his many-sided sympathies. The lesser arts of furniture, metal-work and wood-work, burst afresh through the web which neglect and apathy had woven around them, and have ever since rekindled the enthusiasm of our craftsmen. He at least was one of the first great moderns to teach us that art was not confined to the hierarchy of what are known as "fine," but is an all-powerful influence filtering through every industry, and leavening the whole mass of human thought and emotion. And we see it in every manufacture in the workshop and studio, in the exhibitions of our home crafts, as well as in our buildings. The same fundamental principles, the two great rules summarised by Pugin in "The True Principles," have so rooted themselves amongst our artists and workers, that they seem now almost like intuitions, which must always have been present to every one in every age of art. They were, undoubtedly; but it was reserved for Pugin to restate them when they were entirely forgotten. In his own words, they were, first, "That there should be no features about a building which are not necessary for convenience, construction, or propriety"; secondly, "That all ornament should consist of enrichment of the essential construction of the building." These maxims are so self-evident to every modern architect now, that there is hardly any necessity for their restatement. Every architect worthy of the name observes them. In Pugin's days, the rule was to design a building more or less like a temple or a palace, and tack on to it porticoes, pediments, domes, gables, and buttresses, as the case may be. For, as he observes, "ornaments are actually constructed, instead of forming the decoration of construction, to which, in good taste, they should be always subservient." In these days it is scarcely necessary to remind the artist of these essential rules. In 1840 they were unknown, if not absolutely ignored.

If we carefully consider the meaning of these rules, we gain an idea of what architecture was when the great Gothic Revivalist lived. First we learn that buildings and their features were then separate things, and that any relation between the actual construction and its ornamentation or architecture did not exist, or was scarcely realised by the designer; it was, in a word, building with the addition of a dress of Classic or Gothic details. This superficial idea of architecture no longer exists, but has given place to the more rational view that a work of architecture is an organic product—a piece of artistic construction evolved from the actual requirements. We recognise now laws connecting architectural design with constructive motive, as if, indeed, we could not conceive a design for a building or a piece of furniture without such motive. For a long time architects entertained no other idea of architecture than that it was mere building ornamented, and it was only the leading men of the time who could see beyond this superficial view, and who moulded their building to its conditions. How many were the features which were not necessary for convenience and construction? Buttresses, pinnacles (when there were no thrusts), porticoes, peristyles, domes, vestibules, and a variety of other architectural properties belonging to cathedral churches and to Greek and Roman temples, were placed under contribution. But this doctrine, unhappily, has still its supporters: we see frantic efforts made to put a dress on building rather than to design from *within* outwards. Our method of design is still frequently to make elevations and adapt the plan to them. This inverse order is evident in a much less degree than formerly, and only amongst men who have favoured that division of the profession as set forth by certain accredited teachers. As a consequence of all this, we see a vast change in regard to "style," which is not the foremost element it once was. The style of a building takes a lesser place than it formerly did. Such adjectival phrases as were then common—"The building is in the 'Doric' or 'Ionic' Greek or Roman style," or designed in the "Palladian or Italo-Vitruvian manner"—are not now heard with the same frequency. Material and accommodation and plan are more generally mentioned. Style was then the motive, now it is the resulting expression only of motive and material. And then it is also more general and less distinctive. We all remember when the Classic styles were distinguished by particular phasal distinctions, such as the Hellenic, or Doric, or Palladian, representing the country or the particular school; now the term is used to denote rather the general mode of expression and ornament, without indicating any decided character. Thus, also, the term "Gothic" is come to be used as meaning rather the mode of treating material and features according to Gothic principles, than as a literal description of any particular style. In short, principle, rather than the period, is intended. This development of style is, therefore, in the direction of preserving and retaining the general principle or system in its broad character, and giving up the "accidental" and "local" peculiarities.

The second great principle, "That all ornament should consist of enrichment of the essential construction of the building," has equally entered into the very foundation of all our best art, though there are still a few professors who have taught the doctrine that we must construct first, and then apply the ornament. As in the former maxim, the two things cannot be regarded as separate; but ornament as the outcome of the construction. Once upon a time our grates and fenders, our carpets, our brass and metal-work, and furniture were all designed on the idea that we must apply some historic style of ornament to those objects, no matter what the construction was. Pugin's great principle, now so universally recognised by all our leading artists, is yet in need of being kept in memory by our manufacturers and craftsmen. If we look at some of our modern furniture, we shall see the influence of mere "style" is still predominant. We have makers of chairs, tables, cabinets who follow a popular style that happens to be in vogue at the time, and we see the framing of some of them entirely dictated by a particular period or personal style, such as that of "Chippendale," and the ornament anything but appropriate to the construction. As Pugin said in his day, "Ornament is too often constructed, instead of forming the decoration of construction, to which in good taste it should be always subservient." The lesson needs repeating in these days when the continual splitting up into special trades have promoted the separation of construction from ornament—of those who manufacture and those who design. What is called "taste"—a term not very clear, and, it appears, a very wide one—still governs our manufactures and our furniture as it did fifty years ago. Architects who rightly make their art apply to everything that pertains to buildings, furniture, and decoration are responsible for maintaining and in vigorously asserting that "good taste" is only the application of true principles to the most common objects, or the exercise of common sense guided by art in buildings, furniture, and all accessories. Notwithstanding our undoubted progress in these matters, the tendency to fall into "grooves" has to be resisted by a steady adherence to that brotherhood of the Arts which the great Gothic Revivalist so strenuously inculcated by his work, writings, and life. Happily we have disciples of his equally strong in the faith of the all-embracing mission of true art like the late Mr. John D. Sedding, who showed that nothing was too small or too insignificant to engage the architect's attention, or to enlist his sympathy.

PROTECTION AND PRODUCTION.*

LIKE the Jews of old, most of us work with two hands: in one we bear a sword, and fight for the works of our forefathers; in the other we bear a trowel, and build up as best we may the works that are to express our age to future generations. The temper of protection which this society preaches is one that recognises the genius of the place. We desire that buildings and movable works of art should be carefully and reverently preserved *in situ*. We believe that all fine production is organic, and its real life inseparable from its surroundings. Accordingly this society intercedes for the life of ancient art, shows how it may be prolonged by proper care and use, denies that it can be restored when it has been killed, and both in town and country urges the value of the past upon the present. But the times have been very difficult, and emergencies have arisen under such hasty pressure, that the protection we advocate has often been practically impossible, and so we have to be grateful for the protection afforded by museums to movable works of art. These seem to be the two forms of protection that have become established. The one (in England) has been initiated, and is maintained by the voluntary effort of those who value the spirit of art. The other has been initiated rather by the collector, and is maintained by the State. But why do we take all this trouble to protect ancient art at all? Why do we set such store by our collections of the scattered fragments of antiquity? Are we not in danger of being buried beneath the accumulated stores of bygone material? Indeed, I can understand that humorous recoil from protection which Nathaniel Hawthorne expressed when—after spending some hours in the British Museum—he wished "That the whole past might be swept away, and each generation compelled to bury and destroy whatever it had produced before being permitted to leave the stage. When we quit a house (he says), we are expected to make it clean for the next occupant · why ought we not to leave a clean world for the next generation?" Is there not even to us something attractive in the idea of a clean world, and starting afresh, and doing things because they were positive human requirements, and not clever refinements to meet shifting fancies, or learned exercises in the dead language of a buried style? And yet, when we have smiled over the fantasy of a clean world and a fresh start, we still remain subscribers to the S.P.A.B., and still believe in protection with all its perplexities and difficulties of conduct and adjustment. But why? I think these are the main reasons why it has been, and is now, so necessary to protect ancient art. Because in this century science and commerce have fashioned and demanded man's handiwork in such experimental haste, that human requirement has been deprived of its sobriety. Men have been distraught with their sudden command over time and space, bewildered with a reckless expansion of commerce, preoccupied with enterprises in defiance of natural obstacles, blinded with antiquarian research. So it has come to pass that old works wrought in a different and artistic temper have been destroyed as useless aberrations, or have been restored by means of scientific knowledge. In either case, protection has been the first thing needful. Again, because ancient art is one of the records of the soul of man. It comes down to us through all the shifts and confusions of the centuries with silent messages of spiritual beauty. Like creation, it has neither speech nor language, but its voice has gone out into all lands, and it reveals to us profound glimpses of a pervading inspiration. We, who perceive this, regard the destruction of work of art as a kind of murder, and their subsequent restoration as folly; for we believe that fine work expresses and fulfils the character and imagination of its own generation—and we know that the character and imagination of our own generation can neither be expressed nor fulfilled by scientific, eclectic copies of artistic, traditional achievements. Moreover, we know fine work has within it an inherent power of re-creation. It inspires. It is not merely for historical reasons, for connoisseurship, and for probable value that we protect ancient art, or that the State collects in our museums; but for inspiration. These works and specimens, we say, bear the stamp of permanent beauty. They are counsels of perfection. They have power within them to re-create, and the spirit that once inspired still emanates from them. Protection has been the first thing needful, and such, I believe, are the main reasons for the cause this society advocates. But when we have made our plea, and, through good fortune, a work of art has been protected and maintained *in situ*, or, failing this, its fragments preserved from utter destruction in a museum, I think we turn from past to present, and consider that the end both of protector and collector must be that art should again inspire man's handiwork, and again shape our surroundings. Thus we turn from protection to production, and ask ourselves how it came to pass that such works were produced, how such artists were trained, and, further, how we ourselves are profiting by our knowledge and appreciation of their achievement? To give adequate replies to such questions would require both space and resource far beyond my scope; but it seems to me that from one fine period of art we may gain a suggestion that applies to all. For example, we are all agreed in protecting and collecting the arts that grew and flourished in Italy from the 13th to the 16th centuries. This society has made protests on their behalf. The State has spent thousands in buying up the fragments that remain; and we know a great deal as to the customs and conditions that helped to produce this work we value so much. Well, speaking briefly and generally, it seems that the possibility of producing such works was sustained by means of a wise and constant public demand. A wise demand, and thus the best men in their respective crafts were encouraged. A constant demand, and thus such men and their assistants were kept in work. A public demand, and thus they were called on to give expression to national developments, rather than to the varying fancies of individual connoisseurs. Art was constantly wanted in daily public life. Patronage was wise, for those in power, whether in Church or State, employed the best men, and were ready to abide by the unexpected result. In short, production depended upon an organic custom of employment: a custom that extended to small as well as to great things. Well, how were the workers produced who did such fine things? And what were the methods of study that resulted so fortunately? Clearly methods which were so fruitful in results must share the permanent value of their achievement. The answer is simple: fine workers in the arts and crafts were produced by means of being apprenticed to fine producers; this was their training. The students grew up amid the restrictions, and the advantages, of real work. They absorbed, through practice, traditional methods and experience; they learnt, through practice, the limitations and requirements of work done for, or in, a given place. Thus trained, a born artist succeeded to the surplus work of his master, equipped for the task, and not too fine a gentleman for the job; while an average craftsman was honourably employed in giving help to masters of inexhaustible invention. How are we profiting by our knowledge of the event? It seems strange, but we have decided that artists should be trained in quite another way. Organic custom is no more to be depended on; but scientific system is to avail. Students are to be instructed in large numbers by certificated teachers; production is to be taught by way of abstract exercise, not of living practice; and eventually, when students are sufficiently advanced in their exercises, they may obtain medals and prizes, and may then depart to shift for themselves as best they can, thus making way for more students, more medals, more shifting, and so on. The scientific, political, and official educator likes schemes, schedules, classifications, certificated results, and we are apt to be overawed by this imposing machinery of means; yet, what is the result? We know the result of the old method of production. The work of this society is a standing protest on behalf of their achievement. The State attests its appreciation in our museums. What is the result of our system? The result is that a crowd of students are produced—a supply without relation to a demand—who find out through bitter experience that, in spite of their school success in scheduled exercises, there is no real work awaiting them outside, and that the only public occupation for artists which the State encourages is that of a certificated teacher. I do not think the S.P.A.B. of the future will deal swashing blows in protection of the results of our system, nor do I think that the museum authorities of the future will attest their appreciation by searching England for the relics of such production. Of course not, I shall now be told by the scientific educator; nobody pretends that a State system can produce artists, but it can give equal chances to all clever boys, and it can help the cleverest to emerge by means of examinations, certificates, medals, and prizes. This is the collective idea as applied to art. Is it, really? Does experience teach us to believe in the collective teaching of any art or craft? Is it not a matter of individual affinity? To come across a real live man, engaged upon a real live piece of work, is worth a wilderness of certificated masters; while, as to design, it cannot be taught or learnt apart from practice any more than you can learn to swim on a chair. The collective application of individual achievement—this is the collective idea as applied to art. By which you mean patronage, the statesman will reply, and patronage is without the scope of our Acts. Grants in aid may be mentioned, but it is quite idle to urge State patronage of the arts. We allude, of course, to the work of living artists. As soon as you are all dead, the State authorities who are responsible in these matters will be most happy to encourage such real talent as there may have been among you. Thus are we shown, as usual, to be unpractical persons. Indeed, the artist who writes or speaks on the subject of art does so in fear and trembling; for, traditionally, he is a silent man, "unwise by very reason of his diligence"—so says the Son of Sirach; "Deluded, in the thought that his craft skill gives him insight into all sorts of high matter"—so says Plato; "A trifler, incapable of higher things"—so says Plutarch. And our system is a high matter which confounds the knowledge of the deluded and trifling artist, for he knows that the beautiful works which have escaped from the wreck and restoration of the past were the work of living artists applied to the beautifying of daily life; and yet the same State system that protects and collects, that values and buys these fragments, shuts its eyes upon daily life, and tells us that it can only recognise the work of dead artists as applied to the filling of museums. Truly this is a strange connection between the works we protect and the works we desire to see produced. And it demands our close attention, for now, curiously enough, we see the opinions of this society—namely, that works of art should be retained and maintained *in situ*—are being adopted by the statesman, though not perhaps entirely for our reasons. France has got its ancient buildings swept and garnished, scheduled as historic monuments, and placed under the central sway of an official department. Italy has been awakened to the fact that foreigners come there to see its ancient art, and that the country is being spoiled of its wealth owing to the carelessness of custodians, the enterprise of dealers in antiquities, and the demand of foreign museums. Accordingly, works of art in churches, sacristies, and other buildings are for the future declared to be national monuments, and a State prison awaits the salesman. While at the present moment here in England this State protection of ancient buildings is being propounded as part of the solution of a great social problem. We are now well aware of what we may expect from the State system of science and art so far as it affects production. I do not think the spectacle of our daily public life bears favourable witness to the policy of the past 40 years, and we shall surely do well to pause and to consider before a scientific State system of protection of ancient buildings is inaugurated in this country, whether our experience reasonably leads us to hope that the life of ancient art can possibly be prolonged by the official care of a State department, by unsectarian committees, by scientific custodians, and by policemen. Not in this fashion shall we rightly protect or truly reverence the work of our forefathers; not in this way shall we ever achieve the ideal raised by William Morris, of an art produced "by the people, for the people, a joy to the maker and the user," nor attain our desire that art should again inspire man's handiwork, and again shape our surroundings.

THE THRUSTS ON WALLS AND ARCHES.*

By G. A. T. Middleton.

CHAPTER IV.—RETAINING WALLS SUBJECT TO EARTH PRESSURES.

IN dealing with retaining walls, the main difficulty is to ascertain the pressure which is bearing against them, tending to cause them to overturn; and there are two main cases to be considered—those of earth and those of water pressures. By earth pressure is meant the thrust due to *dry* earth, as if it be wet or waterlogged through lack of proper drainage at back of and weep-holes through the wall, the thrust approximates to that from water. This warning is the more necessary, as water-pressures, as will be presently shown, are considerably greater than earth pressures, and therefore a wall designed to be amply safe when retaining earth may well overturn when that earth becomes charged with water for which no means of escape has been provided.

Different classes of earths have very different effects upon a retaining wall, this depending upon the *natural slope*, or *angle of repose*, which will be assumed by a heap of this earth when resting upon the ground. The following table, taken from the "R.E. Aide-Mémoire," gives the angle of repose of most earths met with in practical work; but where it should happen not to apply, the value can be very readily found by a simple experiment.

Class of Earth.	Angle of Repose.	Ratio of Base of Slope to Height.
Fine dry sand	37° to 31°	1·3 to 1, to 1·6 to 1
Sand, wet	26°	2 to 1
„ very wet	32°	1·6 to 1
Vegetable earth, dry	29°	1·8 to 1
„ „ moist	45° to 49°	1 to 1, to ·87 to 1
„ „ very wet	17°	3·27 to 1
„ „ punned	66° to 74°	·45 to 1, to ·28 to 1
Clay, dry	29°	1·8 to 1
„ damp, well drained	45°	1 to 1
„ wet	16°	3·5 to 1
Gravel, clean	48°	·9 to 1
„ with sand	26°	2 to 1
Loose shingle	39°	1·2 to 1
Peat	14° to 45°	4 to 1, to 1 to 1

It will thus be seen that all particles of earth lying within the angle of repose are naturally held in equilibrium, and are in repose, needing no retaining wall to support them. Particles lying directly beyond this slope, moreover, tend to roll down it, but with a motion and force greatly impeded by friction; while, assuming the back of retaining wall to be vertical, the particles next to the wall tend to fall vertically downwards. Between these two extremes there are all degrees. In any event, however, it may be conceded that the pressure against the back of the retaining wall is that due to the prism of earth above the angle of repose, and that this is resisted partly by the friction of the earth below, and partly by the retaining wall.

Of course, it is possible for the surface of the retained earth to be either horizontal or inclined at any angle within the angle of reposed—or even to be declined, though this last case is rare, and scarcely ever calculated for. In the case of a horizontal or surcharged surface, however, there are widely different opinions held by various authorities as to the direction in which the resultant pressure of the active prism of earth will be exerted against the wall. Poncelet holds that it is always horizontal, Rankine that it is always parallel to the actual surface of the earth, and Scheffler that it is always parallel to the natural slope. Poncelet's direction gives the greatest moment of overturning, Rankine's is mathematically true for perfectly dry earth, while Scheffler's has been found in practice, though giving the least moment of overturning, to be reliable. Rankine's, however, is the theory most generally adhered to—in England, at any rate.

Returning now to the consideration of the value of the thrust, and taking the case shown in Fig. 13 as a generally typical one, the wall being rectangular, the earth surcharged to the plane D E, which is within the natural slope, the angle of repose being A B C, it is seen that it is the prism of earth E D B A which is active to cause thrust against the wall. The earth within this prism has, as has been already shown, exceedingly various tendencies to press outwards against the back of the wall D B, and it is a usual and sufficiently correct custom to bisect the angle D B A by the line B F, and to consider the triangular prism of earth D B F as being homogeneous, and to be acting as a wedge against the two plane surfaces D B and B F, which are devoid of friction, offering only dead resistance.

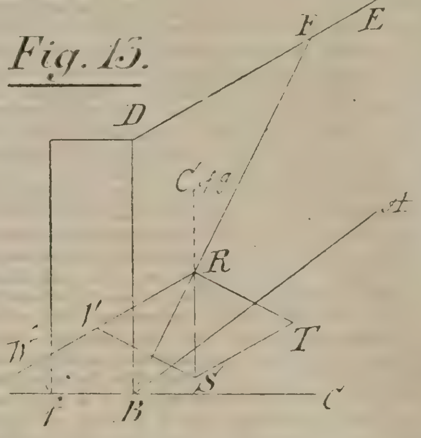

Fig. 13.

The weight of, say, 1ft. run of this prism D B F of the earth under consideration is now ascertained from the following table:—

WEIGHT PER CUBIC YARD OF DIFFERENT SOILS.

	cwt.		cwt.
Dry peat	7½	Common gravel	27
Wet peat	15	Wet sand	28
Top soil	20	Gravelly clay	30
Dry sand	22	Rough water gravel	34
Common earth	24	Grey chalk	36
Sandy loam	24	Sandstone	37
Marl	26	Shale	39
Clay	27	Limestone	40

This weight is collected at the centre of gravity of the triangle D B F, and acts vertically downwards until it impinges at R upon the line B F. At this point it is set vertically downwards, as R S, to a scale of weights, and is resolved out according to the parallelogram of forces into its two component forces, R V acting parallel to the surface of the ground, and R T acting perpendicularly to the line B F. R V is the measure to scale of the force tending to overturn the wall, acting in a direction parallel to the surface of the earth, and impinging upon the back of the wall at a distance from its base equal to one-third of its height, as is shown by the construction. The moment tending to overturn the wall about the point *f* is, therefore, R V × W *f*, the distance W *f* being measured by dropping a line from *f* perpendicularly to the line R V continued.

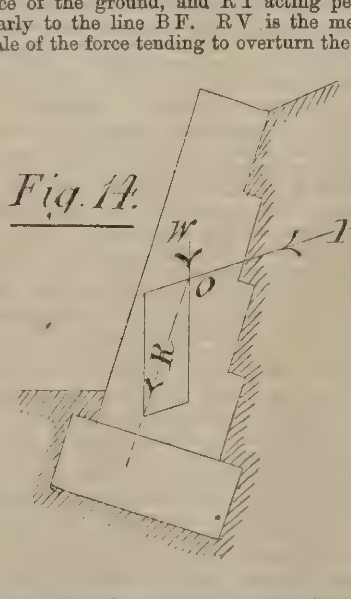

Fig. 14.

This tendency to rotate, of course, has to be met by the tendency to rotate in the opposite direction, as measured by the moment of the weight of the wall, also taken about *f*.

Had Poncelet's theory been adopted, the line R V would have been drawn horizontally; while according to Scheffler's, it would have been laid down parallel to B A, the natural slope. This would not only have altered the length of R V, but also that of the line W *f* drawn perpendicularly to it from *f*, and so have materially modified the result.

So far as the weight of the wall is concerned, this is usually easily ascertained; but it should be borne in mind that if the back be either battered or built in off-sets, all earth lying vertically above the base of the wall acts to assist the wall. Its weight should be added to that of the wall, and concentrated at the c.g. of wall and of this earth combined. At the same time, the back of the wall, against which there is earth pressure (R V, as found above), must be considered to be a vertical line drawn upwards vertically from the back of the base of the wall.

As to the shape which the section of the wall should assume, this is largely a matter of convenience. The rectangular, vertical form is possibly the most common in most work; but its value can be greatly increased by sloping it backwards, so that a vertical line through its c.g. falls further within the base. External buttresses are often used, and, if not too far apart, are valuable additions as widening the base, overturning having then to take place round their outer edge instead of round that of the wall. Where circumstances do not permit of their introduction, internal counterforts are often used instead; but they can hardly be considered to be so valuable, acting in tension instead of compression. Battered faces, internal or external, are economical in masonry or concrete, but difficult to bond well in brickwork if the other face be kept vertical. A stepped back with vertical face has much to recommend it; but possibly the best form for brickwork is that shown in Fig. 14. In this, the the pressure P, as already found, and the weight of wall W meet at O, where a parallelogram of forces is formed, the resultant R of which passes within the centre third of base. The concrete is set at right angles to the direction of R, and the face of wall at right angles to concrete and parallel to R, the back being stepped, but kept parallel to the face.

FAILURE OF CAST-IRON COLUMNS.

IF there is one situation in which, under certain conditions, the architect and the engineer feels himself thoroughly justified in employing cast iron, it will be universally conceded that it is in the form of the column or pillar. It matters little or nothing, so far as the principle is concerned, whether the section be that of the hollow cylinder or of the solid cruciform, or of the H, or of any other shape, which might suit the particular circumstances of the case. It is exceedingly rare that any instances have occurred in which cast-iron has been known to fail when subjected to the proper and fair amount of stress, both in character and amount, while acting as a vertical support to a vertical load. When, therefore, the failure of the material takes place under all these conditions favourable to the stability and durability of the column, especially when as in the example we intend describing, the failure is on a scale of considerable magnitude, it not only becomes endowed with a large amount of interest, but it carries with it a lesson which is worth the attention and consideration of all those—as the majority of our readers are—who are engaged in works of construction. It was on one of the Austrian railways near Eibenschitz, in Moravia, on the viaduct over the river Iglawa, that the cast-iron columns supporting the superstructure proved defective. The viaduct itself consists of six spans of 200ft. each, of lattice girders continuous over the intermediate piers. Each pier is built up of four cast-iron columns, having a maximum height of 90ft. braced longitudinally, diagonally, and transversely by channel irons, the whole being strongly bolted together. The columns are cylindrical, having a diameter of 1ft. 7in. and a thickness of 1½in., and are cast in lengths of 16ft. 5in., with internal flanges to take the connecting bolts. A rake or batter of 1 in 10 was given to the piers, the separate columns of which were securely bolted down to the foundations of masonry and concrete by holding-down bolts 14ft. in length and 2½in.

in diameter. Over the piers the ends of the girders were supported upon a short bearing beam, which was pivoted upon the pin of a roller bed-plate resting over the wrought-iron cap which united the columns of the pier.

It is not necessary to carry the investigation very far, before arriving at a conclusion, which if not completely decisive, will afford, at any rate, very valid reasons for the pillars evincing the unmistakable signs of weakness which characterised their behaviour not very long after they were erected. In the first place, the length of each separate column is of a dimension sufficiently great to allow of a very considerable amount of vibratory action. This oscillation, or tendency to lateral deformation, would occur notwithstanding the efficiency, or as it might be, deficiency, of the cross-bracing between the individual columns constituting the entire pier. It must also be kept in view, in considering the subject, that for the whole of this height of 90ft. the interior of the pillars was filled with concrete, and we have this important distinction to bear in mind. It is, that while the material of the columns, that is, the cast iron, by reason of each column being cast in separate lengths of about 16ft. would yield a little to any swaying or rocking movement, such as no doubt takes place in a pier of the height of 90ft., the concrete inside would not. This difference between the behaviour of the cast iron forming the hollow column and the material inside it which may be considered in the light of a core inside a casting, unquestionably led to the incipient splitting, or the development of the longitudinal cracks or fissures which were observed in the defective columns. At first these vertical or longitudinal cracks were barely perceptible; but as the operative cause which originally gave rise to them continued to act, excited by the *vis viva* of every passing train, they speedily became so apparent that the safety of the whole structure was seriously imperilled. It is very probable in analysing the whole circumstances of this very peculiar, if not altogether novel, constructive defect, that the different rates of expansion and contraction of the cast-iron column itself and the concrete in the interior may have had something to do with the fissures in the ironwork. Both causes were at work, threatening first the stability of each separate column, and ultimately as an unavoidable sequence that of the whole pier. These defects in the cast-iron columns became so serious that all the piers were removed and replaced by substitutes of wrought iron—a change for which we are not aware there has hitherto been any precedent. F. C.

STATISTICS OF THEATRE FIRES.

AT the end of 1893, Herr August Foelsch, the eminent German engineer, died at Hamburg, where he had retired after a most active life on the Empress Elizabeth Railroad (Austria), Lyon-Avignon (France), and other important railways.

The name of this engineer is closely associated with the question of theatre fires and theatre legislature, for many years ago he commenced a close study of the subject, gathering from all quarters of the globe particulars of every theatre fire, noting down the cause and effect. In 1870 he published his first list, which contained accounts of 130 theatre fires, which list he laid before a meeting of the Vienna Architectural Society. In 1878 his list had increased to particulars of 500 theatre fires, while, in 1883, it had been augmented by another hundred. In this manner Herr Foelsch collected data for the guidance and information of his fellow-beings till the day of his death.

The value of the lessons taught by reliable accounts of what has occurred in all countries, at all times, and under all conditions, must be clear to the architect, as well as to the fire expert; for these examples of causes of danger point out what to end and what to amend in the future arrangements and protection of this important class of building. It is, therefore, a matter of congratulation that these valuable statistics have fallen into the hands of an English architect, Mr. Edwin O. Sachs, who has been appointed by the executors of the late Herr Foelsch to continue the work already so ably commenced. This step has been taken under the advice of the superintendent of Hamburg buildings and other important public authorities, and the materials already collected have been forwarded to London for Mr. Sachs to publish and add to, bringing up to date, and continuing.

Herr Foelsch was practically the father of Continental theatre legislation, assisted, it is understood, as far as the essentially practical points were concerned, by the late chief officers of the London and Berlin Fire Brigades, Sir Eyre M. Shaw and Herr Stude.

To give some idea of the nature of the statistics collected by this engineer, we find that up to 1883 twenty per cent. of theatre fires commenced in the day time, 11½ per cent. during the presence of the public, 22 per cent. within two hours after the public had left, and 40 per cent. occurred during the night time. These figures were gathered from authentic and full particulars obtained from accounts of 370 fires. Of course small fires in theatres are not taken into account, as they are difficult to find out; they would swell the list to many thousands.

The first fire that Herr Foelsch mentions in his list is one that occurred B.C. 14, in the amphitheatre of Statilius Taurus; the second noted is the burning of the woodwork of the Circus Maximus, A.D. 21, both at Rome; and so on till we get to the present decade, where about 180 fires are chronicled from between the years 1871-1881. Since 1881 it is roughly estimated that some 300 theatre fires of importance have taken place. Some of the worst are as follows; Brooklyn, 1876, about 280 deaths; Nice, 1881, about 175 deaths; Vienna, 1881, about 450 deaths; Paris, 1887, about 115 deaths; Exeter, 1887, about 85 deaths.

Mr. Sachs, as an architect, will doubtless give force to all points of this important question which are of special interest to architects; he has had exceptional opportunities of obtaining experience on the subject, for, when studying abroad, he attached himself to the head-quarters' staff of the Berlin Royal Police Fire Brigade, and afterwards as supernumerary commissioner in the Vienna Metropolitan Fire Brigade, in both of which cities his duties included the official inspection of theatres. It is, therefore, as a fire expert, as well as an architect, that the work of Herr Foelsch will be continued by Mr. Sachs, and it is understood that he already possesses enough valuable material to give details of quite 1,100 catastrophes. His appointment to continue the work is one favoured by the architects and engineers concerned, as well as the fire officers abroad, who there play a much more important part in their countries' legislatures than firemen do in this country.

The headings under which the statistics will be continued refer to the details of the origin and to the presence of fire watches, permanent or otherwise, the means of communication with the nearest fire station and the distance therefrom, the available force to assist at the fire and the ambulance facilities.

Londoners and architects may consider themselves fortunate that a fellow-countryman has been selected to continue the collection of this valuable information.

TESTING TIMBER.

THE U.S. Government's investigations of American timber being made under Mr. B. Fernow, of the Forestry division, will be of value to builders and architects in the States. These investigations have been made to determine the physical, mechanical, chemical, and other properties of American timbers, and especially the inter-relation existing between these properties. The idea is to combine the results and establish the science of "timber physics." The results ascertained regarding certain timbers, like the "long-leaf yellow pine," which is abundant in the Southern States, are of value. Mr. Kellar, of the Engineers' Club of Philadelphia, describes the methods and apparatus used in determining these data. The tests are carried out at the St. Louis Test Laboratory under Prof. Johnson. The logs vary from 12 to 18ft. in length, and are sawn and stencilled so that their exact position on the tree can be found. Some of these sticks are tested at once, others are seasoned. The tests are (*a*) for cross-breaking of large and small beams; (*b*) tension; (*c*) compression, endwise, and across grain; (*d*) shearing; (*e*) tests on full-size columns. The machines used are of two kinds, one of 100,000lb. for testing large beams, and a smaller one for testing small beams, 4in. by 4in. by 6ft. The cross-breaking tests are plotted to a curve, using the deflections as abscissæ and the loads as ordinates. From the curve the modulus of elasticity was taken as $E = \frac{W}{D} \cdot \frac{l^3}{4 b h^3}$ where W = load in pounds, D = deflection in inches, and l, b, h the length, breadth, and height, the value of $\frac{W}{D}$ being taken as the tangent of the angle made by the original direction of the curve with the axis of the abscissæ. For tensile tests the breaking section is 2½in. by ⅜in.; the endwise compression tests are made on specimens 4in. square and 8in. long. The shearing tests are made on specimens 2in. square and 8in. long. Rectangular holes are mortised 1in. from the ends, the holes being at right angles. For testing full-size columns, the machine has a capacity of 1,000,000lb., and will take a column 14in. square and 30ft. long. Other tests are made for specific gravity and percentage moisture. The long-leaf pine has leaves 9in. to 12in. long, three in a bundle; it has long cones, 6in. or 9in. long, and its wood is the heaviest of the Southern pines, weighing 48lb. per cubic foot. The grain is even, of reddish yellow colour, full of pitch, and with little sap. It is valuable for all constructive purposes, and is the strongest timber in the States. A table of the mechanical properties of this pine is given in a communication in the *Proceedings* of the Engineer Club for March, which contain several particulars of interest, and from which we have quoted.

THE LONDON AND NORTH-WESTERN RAILWAY COMPANY.

GREAT improvements have just been made at the Willesden Junction and Euston Stations for the London and North-Western Railway Co., largely facilitating passenger and vehicular traffic. At the former station the alterations and additions comprise new railway-bridge for Broad-street trains, together with platforms, waiting and refreshment rooms, booking-halls, &c.; approach incline from Harlesden-road low-level platform; iron footbridge for passenger traffic, and additional bay to Harrow-road bridge. About 1,000 tons of iron and steel have been used in these works.

At Euston, a steel bridge 150ft. by 26ft. has been erected, together with approach roadway on massive brick viaducts, for the purpose of taking the milk and parcels traffic. This work necessitated the raising of the roof bodily the whole length of the bridge, and also some very heavy shoring under the existing buildings while inserting girders, which could only be carried out under difficulty, owing to the immense weight to be supported. New offices, platforms, and the general reconstruction of a large portion of the station have been effected.

The whole of this work has been carried out without hitch or inconvenience to the traffic, at a cost of about £60,000, by the contractors, Messrs. Kirk and Randall, of Woolwich, who have completed the work at Euston in the extraordinarily short space of twenty weeks.

THE SOCIETY OF ARCHITECTS AND EXAMINATION FOR MEMBERSHIP.

THE following report of the council of the Society of Architects on the question of examination for membership appears in the current number of the *Journal* of the society:—

On June 26, 1894, the council adopted the following report of the committee on the examination of members:—

"The subject of the desirability or otherwise of an examination of candidates for membership was referred to the council at the Annual General Meeting, held in October, 1893, and since then it has been under careful consideration. A committee was appointed, and drew up a series of questions, which were approved by the council, and submitted to the members of the society. The replies received have been considered, and the opinion of the members appearing to be practically unanimous, the council have decided as follows:—

"1. That after Oct. 31, 1896, election to membership will only be open to candidates who have passed the society's examination, with the following exceptions: (*a*) Candidates who are not less than 35 years of age, and have been directly engaged professionally in architectural pursuits as principals for at least seven years. (*b*) Candidates who are not less than 35 years of age, and have been directly engaged professionally in architectural pursuits as assistants for at least ten years.

"Candidates applying for membership under (*a*) and (*b*) will be required, as heretofore, to submit drawings and other proofs of their professional abilities.

"2. That the scheme of examination shall be formulated and published before June 30, 1895.

"3. That a register of students between the ages of 17 and 23 years be opened on Nov. 1, 1894. Registered students shall be pupils or assistants in architects' offices, and be nominated by a member of the society, subject to the approval of the council.

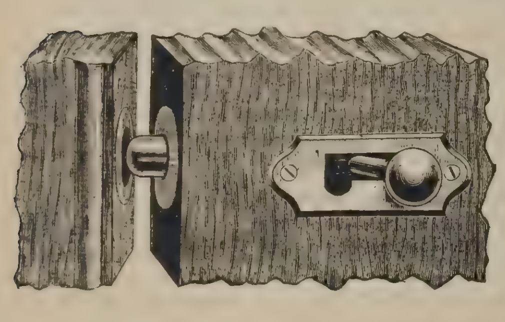
"4. Registered students shall be entitled to the following privileges: Free admission to lectures to be delivered under the direction of the council in London and the Provinces; a ticket giving admission to the society's ordinary meetings, and the use of the society's library for reference; and a copy of each issue of the *Journal.*

"5. That each registered student shall be required to pay 5s. per annum on Nov. 1 in each year, and shall cease to be a registered student on Oct. 31 next after attaining the age of 23 years."

The above report will be laid before the members at the Annual General Meeting in October next, of which due notice will be given.

THE PARAGON BOLT.

THIS new bolt, recently introduced by the Paragon Bolt Syndicate, Limited, of 14, Sherborne-lane, E.C., is sufficiently explained in the sketch, which shows a portion of a door with bolt and socket as fixed. The advantages claimed for the Paragon bolt are great strength, being non-dependent for security on screws; neatness, smooth-shooting, and working not affected by dropping of door. There are no springs to get out of order, and upper bolt of door can be fixed within easy reach. The bolt has already been very favourably received by ironmongers and builders, and numbers have been supplied to several of the railway companies.



A FROTH JUG.

MESSRS. WRIGHT SUTCLIFFE AND SON, of Halifax, have introduced a handy "froth jug" for pouring frothy or fermented liquors. By means of this invention a great saving of labour and annoyance, particularly at a busy time, is effected—no shaking of the jug or blowing the froth away being required, and therefore no wasting of the liquor, as the beer or stout can be poured direct into the glass without a moment's delay.

Already, in a very short time, there have been over 600 of these jugs sold in Halifax. The jug is bound to become popular in all places of entertainment.

COMPETITIONS.

Belfast.—In this competition for a building to cost £20,000, for the Mater Infirmorum Hospital, Belfast, an open preliminary competition was advertised, with a final competition of four or five selected competitors with a small honorarium to each. The assessor, Mr. J. Drew, F.R.I.B.A., has reported, deprecating the waste of time and want of candour that would be involved in inviting several architects to compete again, with a foregone conclusion as to the result. The designs sent in are conclusive as to the main point of a hospital—good general planning. The result of a second competition would be only to place the design now first in the first place again. He recommends the payment of an honorarium to each of the unsuccessful placed competitors. The anonymity of this competition was very successfully preserved, the designs having been sent to the assessor unmarked, undistinguished, and dealt with by himself personally, without the least interference by the promoters, and Mr. Drew's selection has been frankly approved by the R.C. Bishop of Down and Connor as follows: (1) Mr. W. J. Fennell, Belfast; (2) Mr. W. G. W. Ferguson, Belfast; (3) Mr. Godfrew W. Ferguson, Belfast, and Mr. A. J. Gordon, London; (4) Mr. A. T. Jackson, Belfast.

Lancaster.—At a meeting on June 22nd, the designs for the proposed market extension and new hotel in Common Garden-street were considered. Mr. Austin, the assessor appointed by the corporation, reported that the design submitted under the motto "Hostelry" was the best, and that the design submitted under the motto "Onward" was the second in order of merit. It was resolved that the first premium of £75 be awarded to the author of the design sent in under the motto "Hostelry," and that the second premium of £25 be awarded to the author of the design sent in under the motto "Onward." The envelopes containing the names of the competitors were then opened by the chairman, when it was found that the name and address of the competitor under the motto "Hostelry" was Mr. Luke Barlow, of Manchester, and the name and address of the competitor under the motto "Onward" was Mr. Robert Walker, of Windermere. It was also resolved that Mr. Austin's account for acting as assessor on the plans, amounting to £10 10s., be passed for payment.

Monmouth.—At the monthly meeting of the town council, held on Monday, the report of Messrs. Bramwell and Harris, civil engineers, London, on the 18 competitive schemes sent in for drainage and disposal of sewage in the borough was read, and a prize of 30 guineas was awarded to Mr. W. H. Radford, Nottingham, for the best, and a prize of 20 guineas to Messrs. John Parkin and Son, Westminster, for the second best scheme.

Proposed Lunatic Asylum at Bexley.—At Tuesday's meeting of the London County Council the Asylums Committee reported that the purchase of the portion of Baldwyn's estate, Bexley, Kent, as a site for a new asylum was completed on April 10. They now proposed to provide the asylum, to obtain by public advertisement plans and estimates for the erection of an asylum for 2,000 patients, and to duly submit, for the approval of the Council, the design selected. They accordingly recommended that they should be authorised to incur a preliminary expenditure of £2,000. Mr. M'Dougall moved, and Mr. Beachcroft seconded, an amendment that it should be an instruction to the Asylums Committee that the cost (exclusive of site and furnishing) must not exceed £350,000, and that they should engage an architect to be paid by salary, and the necessary assistants, to prepare the plans and supervise the erection of the proposed asylum. During a long discussion, Dr. Cooper expressed his regret that the committee should have gone in the face of medical opinion in asking the Council to erect an asylum for 2,000 patients. It was impossible to treat the disease properly, from a medical point of view, where lunatics were congregated together in such large numbers. This amendment was on a division carried by a majority of 22 votes the numbers being 57 for and 35 against. The amendment, therefore, became the substantive motion, and Mr. Martineau moved to leave out all the words after the word "architect" and insert words asking the committee to consider the advisability of engaging an architect to prepare plans and supervise the erection of the asylum for a fee of £10,000. After considerable discussion this amendment was negatived. Mr. Pearce moved, and Mr. Leon seconded, an amendment reducing the cost of the asylum from £350,000 to £300,000, and, without debate, this was agreed to on a show of hands.

CHIPS.

An anonymous donor has given £2,800 for the erection of a statue of Robert Schumann at Leipsic.

The Select Committee on House of Commons Accommodation decided, on Wednesday, after hearing the evidence of Mr. John Taylor, senior surveyor to H.M. Office of Works, not to recommend any enlargement of the Legislative Chamber itself. They will now proceed to consider the question of the accommodation provided in the precincts of the House.

The London County Council have come to an agreement with the promoters of the London, Walthamstow, and Epping Forest Railway Bill, upon the question of running workmen's trains. The chairman of the Select Committee therefore moved on Tuesday for the recommittal of this Bill, which had been abandoned by the promoters.

The Manchester city council had under consideration on Wednesday a report from the Ship Canal committee, recommending the appointment of a responsible director of the whole undertaking, provided the entire services of Mr. Bythell could be secured at a salary of £3,000 a year. The report was adopted after a discussion.

The West Highland Railway, the first sod of which was cut four years ago, is now completed, and will be opened on Thursday in next week. The line, which is an extension of the North British system, begins at Craigendoran, about 15 miles from Glasgow, and ends at Fort William, with a branch to Banavie. It is 110 miles in length. Though some parts of the line attain an altitude of nearly 1,400ft. above the sea-level, Mr. Forman, the engineer-in-chief, who planned the route, has so dealt with the various gradients that the rise and fall are scarcely perceptible. Messrs. Lucas and Aird were the contractors.

An appeal is being made by the rector of Ledbury for £2,000, to complete the restoration of his beautiful church, one of the finest in Herefordshire.

The proposed length of the maritime canal between the Bay of Biscay and the Mediterranean varies from 220 to 320 miles, and the cost from 1,000 to 1,500 million francs. Some competitors at the exhibition of plans, however, propose that vessels should be transported by railway, or by rolling docks propelled by electricity. The promotors have invited the Government to appoint a commission to report on the plans.

The London County Council discussed and adopted on Tuesday the recommendation of a committee that eight separate Bills be prepared and introduced next session for the acquisition by the Council of the undertakings of the eight Metropolitan Water Companies.

The greater part of Monday's meeting of the Glasgow town council was taken up with discussing the salaries and wages question. A sub-committee recommended that in the master of works' office the salaries of the staff of twelve should be increased by £190, the assistant master of works receiving an advance from £300 to £350. It was also recommended that in the city engineer's office the salaries of the eight assistants should be raised by £180. After a long discussion, these propositions were adopted.

The opposition to the exhibition at the public museum in Preston of Michael Angelo's colossal replica of David has been successful, and on Tuesday large crowds assembled to watch the process of taking the statue to pieces.

The British Consul at Madeira reports that the railway from Funchal to the Mount, which has been in course of construction for some time, has been partly opened for traffic, and it is expected that the whole length will be opened during this year. It is the first railway ever constructed in Madeira, and is on the same principle as the Righi Railway. The total length of the line is 24,000 mètres, the gradient being 25 per cent.

Powers have been acquired for the construction of a new railway bridge over the Hudson River, New York, the main span of which will be more than 2,000ft. long. The bridge is to carry six railway tracks. The foundations of the structure are to be carried down to a depth of 210ft. below high water, which is far beyond the reach of the pneumatic process, and much deeper than any "Indian" well foundation yet sunk.

THE NEW CRIPPLEGATE INSTITUTE.—DESIGNS FOR CHRIST'S HOSPITAL NEW SCHOOL.—WATERHEAD BATHS, OLDHAM.—DETAILS OF BELGIAN IRONWORK.

Our Illustrations.

CRIPPLEGATE INSTITUTE, GOLDEN-LANE, E.C.

The memorial-stone of this building was laid by the Duke of York on Tuesday last, July 3. The building is being erected from designs by Mr. Sidney R. J. Smith, F.R.I.B.A., 14, York-buildings, Adelphi, W.C. Plans in competition from many well-known architects were sent in, and both Mr. Smith's two designs were placed first by Mr. MacVicar Anderson, then President of the Royal Institute of British Architects. The plans have been approved by the Charity Commissioners, and also the London County Council. The scheme is for a building containing library, concert-hall and adjuncts, and technical classrooms. The library is placed on the ground floor, easy of access, and contains reading-room 36ft. by 26ft., newsroom 36ft. by 26ft., and a circulating library to hold 50,000 volumes; and there are also large ward offices on this floor. The first floor is devoted to concert-hall (a large room, 76ft. by 40ft., to accommodate about 450 persons), and also cloak-rooms, committee-room, and a handsome refreshment-room 30ft. by 23ft. On the second floor are the technical classrooms, &c., four in number, and also a caretaker's house, while in the basement are staff-rooms, boiler-house, strong-room, stores, &c. The foundation-stone is a fine block of Portland stone, with a granite tablet and gold letters, bearing the following inscription:—

CRIPPLEGATE INSTITUTE.
This stone was laid by
H.R.H the Duke of York, K.G.,
on the 3rd July, 1894.
H. J. Felton, Chairman.
Sidney R. J. Smith, F.R.I.B.A., Architect.

The building is to be externally of red bricks and Portland stone.

CHRIST'S HOSPITAL NEW BOARDING SCHOOLS, HORSHAM.

Following up the series of plates already given in our last two numbers in illustration of these designs, we continue our selection of reproductions taken from the original drawings submitted in this important and extremely interesting competition. Mr. T. G. Jackson, A.R.A., removed his plans after the award had been made, so that our descriptive notes published three weeks ago cannot be supplemented by any illustrations. As might be, of course, depended upon, there was much in his design which may be described as admirable; but it lost the advantage obtained by good perspective views, as none were exhibited in illustration of his scheme, and indeed his general elevations were hardly shown to the best advantage, while the block plan, the only sheet representing the undertaking as a whole, looked confusing and difficult to readily understand. The inevitable impression left, therefore, on the mind, unfortunately, is that Mr. Jackson hardly did himself justice on this occasion. Our four plates accompanying these remarks to-day are devoted to the further elucidation of the chosen design by Messrs. Webb and Bell, and in illustration of the dining-halls from the schemes of Messrs. Paley, Austin, and Paley, and Mr. T. E. Collcutt. The chapel in the selected plan, though pleasing and suitably treated, is not, in our opinion, the strongest feature in the general composition, and in comparison with Mr. Jackson's beautiful and dignified chapel, it must rank as decidedly inferior in idea, though allowance may be made in deference to the limitations of cost. The seating of the preparatory pupils in the aisle, though ingenious, isolates the younger children in an unhappy way from a view of the manual acts of the service at the altar; in fact, the arcade piers will entirely cut off from most of these little boys all view of the sanctuary. Children learn more by the eyes very often than by the ears, and object lessons with them are of prime consequence, engaging their attention and insuring good conduct far better when they are prominently located during service. To stow small children away in this fashion is perpetrating a permanent mistake. The chancel is mean and inadequate, showing little appreciation of a worthy service of the altar. The covered way leading from the cloisters to the dining-hall is divided by the old gateway seen in the view, and intended to be rebuilt as one of the main entrances to the quad. The same feature occurs in our second plate, which shows the library building, for which we have nothing but praise. Mr. Collcutt's dining-hall speaks for itself and calls for little comment here. It looks, perhaps, too much like a town hall or corn exchange, and is needlessly massive in constructional features. The tracery of the windows with the secondary arched rib is not very pretty, and repeats a form already made enough of in the roofing arches. Mr. Austin's dining-hall with its Fratery pulpitum, looks more hospitable anyhow, and in spite of the rigidly typical Perpendicular fenestration adopted, the interior appears more domestic-like and suitable. The gallery in the roof may serve perhaps a useful purpose, but if so, it would be conducive to "larks," and as an architectural feature it seems decidedly open to question other than as a quaint conceit on the part of the designer. The plans displayed under the view of Mr. Collcutt's hall show the arrangement of his block of boys' houses and masters' residences with their circular dormitories. A square treatment for these wards was shown as an alternative, but in other respects the plans remained the same. The cleverness of these buildings is conspicuous, but the defects following upon the isolation of the lavatories and consequent necessity of intercommunication in the corridors and landing spaces are manifest, insuring, as such an arrangement must, all kinds of pranks and exploits among the boys, with endless trials of anything like effective discipline.

WATERHEAD BATHS, OLDHAM.

This building, which was opened in May last, is situate at the corner of Cedar-street and Mortar-street. The superintendent's house, placed at the angle of the two streets, contains sitting-room, kitchen, and scullery on ground floor, three bedrooms, and has a cellar. In the centre of the block is a ticket-office, well lighted by a large bay window. This room contains fitments for storage of towels, &c. On each side of the room are the male and female entrance corridors, fitted with swing doors having upper panels glazed, and separated from ticket office by glazed screens with pay window and registering turnstiles to each, a gate being provided to turnstiles for use of officials, &c. The cross corridor behind leads on one side to 12 male slipper baths, and on the other to 6 female slipper baths, there being a separate waiting-room for each sex. The whole of the slipper baths are porcelain, glazed inside and out, and having no wood framing round. Five of the slipper baths will be used as first-class baths, having showers and other advantages over the remainder. The supply of hot and cold water is regulated by means of valves worked by a detachable handle by an attendant in the corridors. From the cross corridor the plunge bath is reached, the dimensions of this room being 74ft. by 46ft., with a water area of 60ft. by 26ft., the depth being 6ft. 6in. at one end and 3ft. 6in. at the other. The bottom is tiled with black and white tiles, formed in panels, the sides being faced with white glazed bricks. A diving platform is provided at the deep end of bath. Round the gangways are ranged 42 dressing boxes, there also being the necessary footbath, shower, w.c.'s, urinals, &c. Six Stott Thorp pendants, with ornamental wrought-iron scrolls, are provided. The entrances to this bath are so arranged that it can be used by either sex without interfering with private bath corridors. At the rear of the premises are the laundry and boiler house, the former being fitted up with all modern requisites, consisting of patent steam-power washing machine, also rinsing tank, with wringer having rollers of vulcanised indiarubber, wringing and mangling machine; drying chamber containing 6 drying horses, four washing troughs all fed with steam, hot and cold supply, the whole of machinery being worked by steam-power by means of a vertical steam-engine and shafting driven with belting. A two-flued boiler, 15ft. by 6ft. 6in., made by the Oldham Boiler Works Company, supplies steam for the whole of the system throughout. The floors to the whole of baths and corridors are of steel joists, and finished with granite-faced concrete, being plentifully supplied with channels and grids to convey away surplus water. The baths and corridors have dadoes of white glazed bricks, with ornamental bands at top. The whole of the premises are efficiently heated by steam. The continuous lantern lights both over plunge and private baths are made to open from end to end for ventilation by means of cranked levers, &c., worked by attendant from the floor. The whole of the building work has been carried out by Mr. William Lees, the sub-contractors being:—Excavating, concreting, and brickwork, Messrs. S. and J. Smethurst; masonry, Mr. J. Bebbington; steel joists, &c., Mr. Edward Wood, Manchester; wrought ironwork, Mr. J. Kershaw; slating, Mr. Joseph Jackson; plumbing, glazing, and painting, Messrs. Harker Brothers; and plastering, Mr. David Rothwell. The whole has been executed according to the plans and under the supervision of Mr. Charles T. Taylor, A.R.I.B.A., architect, 10, Clegg-street, Oldham, whose design was placed first by assessor in open competition.

DETAILS OF AN IRON GRILLE FROM BELGIUM.

These details of wrought ironwork, which we illustrate on another page, are good examples of modern metal work, well designed for the use intended of them, and coupled with a certain degree of character. They were designed for a Belgian House, of which Mr. P. Hankar is the architect, and our illustration is taken from the pages of our contemporary, *L'Emulation*.

CHIPS.

In the case of William Pailthorpe, of Belgrave, Leicestershire, and Leicester, builder, the discharge from bankruptcy has been suspended for two years ending April 19, 1895.

At the last meeting of the Libraries Committee of Glasgow Town Council, it was intimated that a legacy of between £3,000 and £4,000 had been left to the Mitchell Library by the late Mr. Edward Lewis Campbell, of Hillhead.

The members of the Cardiff Naturalists' Society had their annual field-day on Wednesday week, when a visit was paid to the Golden Valley, Herefordshire, under the guidance of the president, Mr. Edwin Seward, F.R.I.B.A. The places visited included Hay, Clifford Castle, Peterchurch, Vowchurch, and Abbey Dore Church.

A Primitive Methodist chapel is about to be built at Ewloe, near Hawarden, from plans by Mr. J. D. Mould, of King-street, Manchester.

A villiage club-room, library, and reading-room are about to be built at Milton, Warwickshire, at the sole cost of a local owner of charcoal works. Mr. R. Dain, of Burslem, is the architect.

Some time ago the Markets Committee of the Leeds Corporation decided to remove the present Fish Market from Kirkgate to the Hay and Straw Market in York-street. They advertised for tenders for carrying out the work, and seven were received. The committee have accepted that from Messrs. Cross and Carter, of Bowman-lane, at about £3,000. The materials of the present building will be used for inside work in the construction of the new market, but there will be an entirely new roof, the old roof having been sold.

St. Werburgh's Church, Derby, which has been reconstructed from the designs of Sir Arthur Blomfield, A.R.A., at a cost of nearly £14,000, was consecrated on Thursday in last week by the Bishop of Southwell. The foundation-stone of the building was laid by the Duke of Devonshire in April, 1892.

WAYSIDE NOTES.

I CANNOT account for the singular want of judgment displayed by those who have the charge of the thoroughfares of London on days like last Saturday, when Royalty is abroad on errands of usefulness. Here in the Strand, just before the procession passed, the streets were, quite unnecessarily, strewed with shell and gravel. The thoroughfares were quite clean, and the gravel was not in the least wanted. By three o'clock it had been trampled into a powder that was a nuisance, but not a water-cart put in an appearance, and people were literally white with dust, and freshly-painted shop-fronts were simply ruined. I suppose it is no one's business to exercise a little nous on occasions of this kind; but it is not very creditable to vestry government, for all that. In the City itself things were much better ordered. Whatever may be said about the Corporation, I always maintain that there is not a district in London scavenged and kept in order like that of which it has the government.

At a recent meeting of the Restoration Committee for the Church of St. Bartholomew the Great, it was announced that £1,300 had been raised out of the £3,500 required to complete the restoration of the Lady Chapel. The Committee, anxious to place all the old work beyond the possibility of destruction, decided to remove the whole of the modern dilapidated and ruinous buildings from the ancient structure at once, to place a roof on the old walls, which would be put into sound condition, both externally and internally, but to leave the finishing of the interior until such time as funds may come in. By this decision the whole of the work will be preserved. The cost of this scheme will be £1,600, leaving £1,900 still to be raised. The decision is a sensible one, and in keeping with the wisdom and care with which the whole restoration of this unique and precious monument has been conducted.

Preston appears to be nearly as virtuous a town as Glasgow. The opposition to the exhibition of the colossal replica of Michael Angelo's "David" at the Public Museum, Preston, has been successful, and on Monday morning large crowds assembled to watch the process of taking it to pieces. The action of the Free Library Committee is said to have excited considerable comment, and thousands have been attracted to the spot. Doctors and clergymen have discussed the statue from the commencement, whether with approbation or condemnation I do not know, nor can I imagine what can have prompted the rancour which has been evoked by this replica of one of the masterpieces of the great Florentine.

Mr. R. Harris Reeves, of the firm of R. H. Reeves and Co., Civil Engineers, Putney, has published an answer to the recent report on sewer air investigations by Mr. J. Parry Laws, F.I.C., published by the main drainage committee of the L.C.C., which you lately noticed. Mr. Laws, in his report, observed that sewer air was very free from microbes, and that the germs of disease could not spread by sewer air, although he admits that sewer air "may contain some poisonous chemical substances which may produce a profound effect upon the general vitality." Mr. Reeves protests against the conclusions of the report as being one-sided, and observes that if it is true that the germs of disease cannot emanate from our sewers, then the teachings of the Sanitary Institute are misleading, the experiments and writings of Dr. Parkes, Professor Corfield, Sir Douglas Galton, and others are incorrect, and other lectures and congresses simple waste of time. He proceeds to give an outline of sanitary tests and experiments made by himself and others in five sections of sewers in the London area. Mr. Reeves's conclusions appear logical. He gives many lists of sewer ventilation, and the results of testing the ventilation of main sewers, all of which show that the germs of disease are favoured by poisonous gases, though no organisms may be found in the sewer air itself.

It is quite time the London County Council thought of building a tall fixed bridge much lower down the river than the affair which the City Corporation has just finished, and for which its ornaments of rank and station are made baronets and knights, while a C.B. is flung to the engineer who did the work, and the architect who made it presentable gets nothing. East London wants work, and British engineering is equal to the task any day of outdoing the Brooklyn Bridge. Why not supersede the Thames Ferry at Woolwich by a really great bridge? The yearly-increasing traffic between North and South Woolwich and the adjacent districts would amply warrant such an undertaking.

The Society of Architects' examination scheme, the details of which, as recommended by the Council, you publish this week, is a well-considered and wise one. I venture to predict that it will speedily double the society's membership. The scheme will be submitted to the members for approval in October. If adopted, the plan of the examination will be promulgated twelve months from that date, and it becomes compulsorily a year later—or two years in all from now. The provisions for the registration of students of the society are sensible. Students will pay five shillings yearly, and will be entitled to most of its benefits. They will gradually prepare for its examinations during their articles, and in due time obtain entrance to full membership. Thus—in default of Registration—we shall at last get some guarantee for the public of the fitness of the men it employs as architects.

The scheme has several features which differ for the better from those of the Institute Examination. There are one or two which may need modification. All interested in the welfare of the profession should study and discuss them. And every architect *is* interested, because now that a rational plan of examination is going to be made compulsory, and that a sufficient margin of time is given in which architects of present standing can become members of the society, it behoves all who are as yet unattached to join, and to see that after another two years the door shall be shut on all but those fit and trained for the profession by its studentship and ultimate membership by examination.

◆

The parish church of Monzie, near Crieff, which has recently undergone extensive alteration and renovation, was reopened on Friday.

The contractors have commenced the construction of a new iron bridge over the river Dee at Maryculter, to connect the counties of Aberdeen and Kincardine. There is no bridge over the river between the Bridge of Dee and that of Park, a distance of nine miles. The site of the new connecting link is opposite Milltimber railway station, half-way between the two existing bridges, and connecting the cross road from Stonehaven with that to Skene and Echt. The cost will be £5,400.

In Queensland, according to the returns from the Emigrants' Information Office, there is no material improvement in the building trade at Brisbane; but the erection of the new bridge over the Brisbane river is giving employment to iron-workers, navvies, pile-drivers, masons and labourers, of whom, however, there are plenty on the spot. In the north there is no demand for emigrants without capital; but as land is now very cheap, a man with a capital of £600 would find a good opening.

Probate duty has been paid on £121,823, as the value of the personal estate of Mr. George Burt, late of Purbeck House, Swanage, formerly Sheriff of London, who died on the 18th April last, aged 77 years. Mr. Burt devises the Purbeck House estate to the use of his daughters or the survivor of them whilst unmarried. Subject to this trust, the Purbeck House estate is to be in trust for the testator's son, John Mowlem Burt, for his life, with remainder to his son Edwin John and his first and other sons successively. The contents of Purbeck House are to devolve as heirlooms. Mr. Burt leaves all other his Swanage estate in trust to be managed and developed as a building estate for twenty-one years, at the expiration of which period the estate is to be sold.

Services were held on Sunday at St. Luke's Church, Barton Hill, Bristol, in celebration of the completion of the new chancel and vestry. Some wooden imitation arches, with wooden pillars, have been removed; a stone arch has been made in the east wall, and the boundary of the church has been thrown back to include the space occupied by the former vestry. The memorial stained-glass windows have been removed into the new chancel, and a new vestry has been formed, inclosed by a carved screen. The organ has been removed from the choir to the south-east corner of the church, and choir stalls have been provided. A new communion table, made in Jerusalem of olive wood from the Holy Land, has been placed in the chancel. The architect was Mr. E. W. Barnes, of Guildhall-chambers, Bristol. The contractors for the main portion of the work were Messrs. King and Son, of Bitton.

OBITUARY.

Mr. William Field, formerly a well-known railway contractor in partnership with the late Thomas Brassey, died at his residence, Stretton Priory, Shrewsbury, on Wednesday week, aged 82 years. Mr. Field was brought up to the medical profession, and practised at Rugeley, and was house surgeon at the North Stafford Infirmary for several years. In the course of his attendance upon the men constructing the Trent Valley Railway, he was brought into contact with the late Thomas Brassey, and subsequently became his brother-in-law (Mr. Brassey and Mr. Field marrying two sisters), and was largely engaged with him in the construction of most important works. He was associated with Mr. Brassey in the construction of the Shrewsbury and Hereford, Shrewsbury and Crewe, Severn Valley, Wellington and Market Drayton, Leominster and Kington, Craven Arms and Knighton, Tenbury and Bewdley, Wenlock Railway, and Wenlock and Craven Arms, besides others in the North Stafford district. Mr. Field founded, and was for many years the colonel of, the 1st Shropshire Artillery Volunteers, upon which he spent large sums of money.

◆

CHIPS.

The memorial statue to Barry Sullivan was unveiled at Glasnevin cemetery, Dublin, on Thursday in last week. The statue is the work of Sir Thomas Farrell, P.R.H.A.

The Guiseley local board have decided to make application to the Local Government Board for sanction to borrow £10,000 for the purpose of purchasing the works and plant of the Guiseley Waterworks Company. The amount includes £1,500 for a new reservoir, and nearly £500 for the renewal of pipes.

The Dean of St. David's (the Ven. James Allen), who is about to resign his deanery, has for years devoted the greater part of his stipend as dean to the restoration of his cathedral.

After a two-days' inquiry before a committee of the House of Commons, the promoters of the East Denbighshire Railway Syndicate have succeeded in throwing out the Great Western Railway Bill for constructing a railway from Rhos to Wrexham, the Great Western Company having previously been instrumental in throwing out the East Denbighshire Bill in the House of Lords.

The Quarry Commissioners have returned from their inspection of slate quarries in the north of France. Several samples of slates and photographs of rocky strata have been secured, and valuable information also obtained as to the methods of Continental slate-working. The commissioners will now resume their sittings at Blaenau, Ffestiniog, Merionethshire.

The foundation-stone of the new Congregational church at West Hampstead, the site for which immediately adjoins the new buildings of Hackney College, Finchley-road, was laid on Saturday. The church will provide accommodation for 1,100 worshippers, and is being erected from the designs of Messrs. Spalding and Cross by Mr. T. H. Kingerlee, of Oxford. The cost of the church, including the site, will be about £11,000.

On the afternoon of Monday week, the 16th inst., there will be unveiled, in the parish church of Hampstead, the first memorial to the poet John Keats upon English ground. It consists of a bust of the poet, executed in marble by Miss Anne Whitney, of Boston, Massachusetts.

The Duchess of Sutherland paid a visit to Plaistow on Saturday, for the purpose of laying the foundation-stone of the nave and aisles of the new parish church of St. Mary, the chancel of which has already been completed. When finished the nave and aisles will seat about 900 persons, and will have cost £11,000.

On Saturday the memorial-stones were laid of a new Conservative Club, situate off Memorial-road, Walkden. The new building is to cost about £2,000.

Mr. John Whittaker, builder and contractor, St. Helens, died somewhat suddenly at his residence, Oak Cottage, St. Helens Junction, on Monday, at the age of 70 years. Mr. Whittaker was able to attend to his business engagements up to Saturday last. His early life was spent in Manchester, but for the last 40 years he had resided and carried on business in St. Helens. Among the many buildings in that town erected by the deceased gentleman are the corporation baths in Boundary-road, and the water-softening works of the corporation at Thatto Heath.

The name of Mr. Peter Green, builder and contractor, of Silver Hill, Hyde, has been placed on the Commission of the Peace for Cheshire.

Building Intelligence.

Burslem.—The swimming-pool, the first completed section of the new public baths for Burslem, was opened last week. The front buildings and other departments have yet to be added. The bath is the largest in the Potteries; it is situated near the loop-line railway station, in Moorland-road. The building contract was taken by Mr. William Cooke, of Burslem, for £7,800, but the total cost of the baths, when completed, will be £9,500. They will be constructed from plans by Mr. F. Bettany, borough surveyor. The water area of the large bath is 75ft. by 33ft., and the depth gradually increases from 3ft. 6in. to 6ft.; but for entertainments the depth can be increased by 1ft. The bottom of the bath is paved with white glazed bricks, relieved with coloured bands, and the sides are of white glazed tiles, also relieved by coloured tiles. A gallery runs round the bath, and will accommodate about 500 spectators. There are 50 dressing-boxes. The interior walls are red pressed bricks, with buff bands and patterns. The principals of the roof are of iron. The lighting is from the top, the glass extending over the whole of the building.

Cheltenham.—The new wing of Cheltenham Ladies' College was opened last week. It extends along Montpelier-street to the Old Theatre. As carried out, the buildings consist of a new house for the lady principal, standing to some extent on the site of the old one, and including an entrance hall and large inner hall, with main staircase communicating with various parts of the college on the upper floor. Beyond the house, on the ground floor, is the Cambridge room, 36ft. by 30ft., and the library, 70ft. by 25ft. Both the rooms have galleries constructed over the corridor, accessible by winding stairs of iron. Above them are the Oxford room, 39ft. by 36ft., with a high open roof and tall windows, and the museum, 70ft. by 33ft. 6in., constructed with walls uninterrupted by windows, and a roof with semicircular steel girders, filled in with ornamental ironwork, all the upper part being glazed. Beyond this block, again, is a second entrance with staircase, cellars, cloak-rooms, lavatories, and a curator's room opening into the museum by a large window. This end of the building joins the Old Theatre. The whole block virtually consists of a long parallelogram over 200ft. long, with an average depth of 43ft. The whole of the buildings are heated by hot-water pipes and radiators. The style adopted is that of the earlier college buildings, but for the most part simple in character. Externally, the buildings are of Cleeve Hill stone, with a pea-grit plinth, and Red Farleigh dressings. Inside, the walls are lined with buff or red brick, lines of other colours being sparingly used. An important feature is the large amount of decorative ironwork to the museum roof, the main stairs, and the galleries of the library and Cambridge room. This was executed under the architect's supervision by Messrs. Letheren and Sons. The windows towards the street are mostly filled with stained glass, that in the lady principal's house being by Messrs. Pearce, of Birmingham; the Cambridge room and library windows by Messrs. Heaton, Butler, and Bayne, with medallions of great authors and symbols suggested by their writings. Cartoons for the Oxford room are being prepared by Mr. W. B. Richmond, A.R.A. The carving throughout is by Mr. Martyn, the statues being either from his workshop or Messrs. Boulton's. The warming is by Messrs. Marshall, and the steel roof of the Museum by Messrs. Measures. The architects are Messrs. H. A. Prothero, M.A., Balliol College, Oxon, and Mr. J. H. Phillott, M.A., Christ Church College, Oxon; and the contractors are Messrs. A. C. and S. Billings, the outlay being £15,000.

Lasswade, N.B.—After undergoing extensive alterations, involving the entire reconstruction of the interior of the building, the United Presbyterian Church at Lasswade was reopened on June 28th. A belfry and entrance porch have been added to the church. Internally, the structure is now re-seated, decorated, and a new pulpit and a couple of memorial windows of stained glass, executed by Messrs. Ballantine and Gardiner, of Edinburgh, have been added. One window contains in one light representations of "Moses Delivering the Law," and "Moses with the Brazen Serpent"; while in the other are representations of "Christ's Sermon on the Mount," and "Christ Restoring the Blind." The tracery is devoted to "The Burning Bush." The other window contains representations of John the Baptist preaching and baptising, "Christ with Martha and Mary," and "The women showing to Peter the Garment made by Dorcas," these being surmounted by the symbol of "The Seven Golden Candlesticks." The improvements and gifts cost some £1,200. The architects were Messrs. Hardy and Wight, Edinburgh.

Linlithgow.—A commencement is being made with the restoration of the fine parish church of St. Michael, adjoining the palace at Linlithgow. Almost £3,000 has been raised, and Mr. John Honeyman, A.R.S.A., of Glasgow, has been consulted as the architect. Until recently, the interior has been partitioned off, disfigured by unsuitable galleries, marred by whitewash, and had been allowed to assume an aspect of neglect and decay. The modern partition between nave and chancel has been removed, and the galleries, erected about 1812, when the chancel was fitted up as the parish church, have been cleared away. The inside floor, which had been raised a foot above its original level, burying thereby the bases of the piers, and obliterating the step between it and the chancel, has been lowered, and among other work which will be undertaken will be the rebuilding of the chancel arch, the formation of a heating chamber on the site of the old vestry, the renewing and altering of the heating apparatus, and the re-seating of the church.

Misson.—The parish church of Misson, dedicated to St. John the Baptist, was, on Tuesday week, reopened by the Bishop of Southwark, after restoration rendered necessary by partial destruction by lightning a year ago. For the restored portions of the structure the architect was Mr. J. Hodgson Fowler, of Durham, and the builders were Messrs. Bowman and Sons, of Stamford. New roofs have been added to the nave and north aisle, and that of the south aisle thoroughly made good, two new floors placed in the tower, the walls re-pointed, the chancel-floor raised, the old seats renewed, and new ones supplied where required. The cost has been £1,350.

Seacombe.—The new west front, which has been added to the R.C. Church of Our Lady and St. Joseph, Seacombe, was recently opened. The church, which was built by Mr. John Shaw, of Birkenhead, from the designs of Mr. Edmund Kirby, of Liverpool, was opened on July 28, 1889, but was left incomplete at that time, the west end being temporarily closed by a brick wall. The work of completing the edifice was commenced in July, 1893, and the additions, as in the case of the original building, are from the designs of Mr. Kirby, carried out by Mr. Shaw. The additions consist of the west front to nave, with north-west porch, and baptistery on south-west, and a side chapel on the south-east. In the west front is a deeply-moulded arch surrounding a wheel window, the tracery moulded both externally and internally. Below this window, and above the great doorway, are six lancet windows. In the doorway are two doors of oak opening outward, divided by a stone mullion. The spandrels are carved with vine-leaves and grapes, and the mould over the arch is surmounted by carved crockets and finial. The north porch has a traceried window, and the baptistery has two simply traceried windows. The side chapel rises above the aisle roof, with window in gables and two lancet windows in sides. The church is now structurally complete.

Smithfield, E.C.—At the last meeting of the Committee for the restoration of St. Bartholomew the Great, it was announced that £1,300 had been raised of the £3,500 required to complete the restoration of the Lady-chapel. The great importance of placing the whole of the old work beyond the possibility of destruction weighed so much with the Committe that they decided to remove the whole of the modern dilapidated and ruinous building from the entire structure at once, to place a roof on the old walls, which would be put into a sound condition, both externally and internally, but to leave the finishing of the interior until sufficient funds are provided. By this decision the whole of the work will be preserved. The cost of this scheme will be £1,600. Mr. Aston Webb has been the architect for the whole of the restoration.

Streatham, S.W.—The British Home for Incurables has been transferred from the old buildings on Clapham-rise, the lease of which had expired, to new premises in Crown-lane, Streatham Common, which were formally opened by the Prince and Princess of Wales on Tuesday. The new buildings have been erected from plans by the late Mr. Arthur Cawston, A.R.I.B.A., whose death by a revolver accident we reported three weeks since. The site is $4\frac{1}{2}$ acres in extent, and slopes away from Crown-lane, so that it was necessary to set the building well back from the road. The different levels are connected by a series of gradual slopes. The building is divided into two blocks, the western block being stepped back 50ft. farther from the road than the eastern block. The corridor in each block runs at the rear of the patients' living rooms, and has windows on its northern side. The corridor that connects the two blocks, however, is brought to the south and opens on the terrace. In all living rooms and wards the windows have been brought to within 18in. of the floor, to enable bedridden patients to enjoy the views of the grounds and roadway. The ground floor is entirely devoted to the kitchens and general service. On the main floor are the patients' rooms, all light and varied, the main staircase adjoining the connecting corridor, as well as the main entrance and committee-room. These latter form a small entrance wing projecting southwards towards the road. Adjoining this entrance wing the private chapel—a special gift—is still in course of construction. Near the entrance wing a space has been left for an entertainment hall, which will be so planned as to be entirely shut off from the main building when hired by residents for concerts. The arrangement of the first floor is practically the same as that of the ground floor, and will be devoted to female patients. Entrance will be provided from this floor to galleries in both chapel and entertainment hall, so that the patients can be wheeled directly to both. The upper floor is devoted to the use of the female staff, and includes a large recreation room for the nurses. The corridors are all fireproof, on the Fawcett system. All the door and window fittings have been supplied by Messrs. James Hill and Co., 100a, Queen Victoria-street, E.C., who also presented the opening key of solid silver gilt with enamelled monogram used by the Princess at the ceremonial.

Windsor.—Holy Trinity parish church was reopened last week, after restoration, in celebration of the jubilee of its erection. One of the chief improvements is in the flooring, the nave and transepts having been repaved with pitch-pine wood blocks, with a red and blue tiled border, in lieu of the old stone paving. The nave interior has been decorated in colour. The west end of the church has a new organ-screen in seven panels. The centre panel bears a large figure of St. George, representing England. On one side are three panels filled with figures of the 1st and 2nd Life Guards and the Blues, and on the other side the three panels contain figures of the Grenadier, the Coldstream, and the Scots Guards. All the figures are those of officers. In the rear, on the pilasters, are figures of St. Andrew and St. Patrick. The spandrels of the arch are filled in with damask pattern, and shields of dolphins and lions rampant. The Guards' Memorial Chapel has had the inscription renovated. The chancel has also been decorated and renovated. The decorations were designed by Messrs. Wyborn and Lee, and have been carried out by Mr. E. Bampfylde. The figures of the soldiers and the saints were executed by Messrs. Campbell and Smith, London.

Wolverhampton.—The commemoration-stone of the new Grand Theatre, which is in course of erection in Lichfield-street, Woverhampton, was laid on Friday. The front elevation, which will be of stone and brick, will be 123ft. long, and the depth of the building, which will face Berry-street in the rear, will be 122ft. The dimensions of the interior of the theatre are:—Auditorium, 70ft. wide; pit, from curtain line to back wall, 58ft.; depth of stage from curtain line, 41ft. 6in.; and width of ditto, 65ft. 6in.; proscenium opening, 35ft.; height from pit floor to centre of ceiling of auditorium, 39ft.; height from stage floor to gridiron, 55ft. Provision will be made for five classes of patrons. On the ground floor will be the pit seats and pit stalls. The dress-circle will be on the first tier of the amphitheatre, and the gallery on the second floor. The stage will be divided from the auditorium by a fireproof curtain. The structure is being erected by Mr. H. Gough, Woverhampton, from designs by Messrs. C. J. Phipps and Son, architects, London.

The Thoresby Society of Leeds visited, on Saturday, Ripon Minster and Markenfield Hall.

Correspondence.

THE TOWER BRIDGE.

To the Editor of the Building News.

Sir,—It may not be out of place now that the public mind is engrossed with the new Tower Bridge to criticise from an architectural standpoint the latest addition to architectural and engineering science.

Looking at the structure as a whole, it cannot, I think, be called an architectural success. The general impression on one's mind is that the architect and the engineer have been struggling for the supremacy, and the former seems to have come off second best.

The architect appears to have clothed the steel skeletons of the towers themselves with architectural skin and flesh, leaving the skeleton arms of the mid-river ones shaking hands with their smaller brethren on shore in all their bald and naked ugliness, giving one the impression that he had exhausted his resources when having to deal with these members.

It may, I think, be fairly asked, Are these members necessary? Surely if the high-level foot-bridges, with their 200ft. span, could be constructed as a lattice girder, and clothed with an ornamental parapet, the side spans of 270ft. could have been similarly treated, and thus have given a more substantial appearance to this portion, and obviated the main chains, which architecturally are an eyesore, and spoil the whole composition.

The two mid-river towers have some good Tudor detail, but the corbelling of the angle turrets from the circular to the octagonal portion is very poor. The upright lines of the angles, viewed from a distance, have an element of weakness which would have been absent had these lines been battering, as in Sir Horace Jones's original design.

The wall surface seems to be frittered away by a multitude of tiny windows, and lacks dignity, repose, and depth, and surely a castellated parapet without the high-pointed roofs would have been more in keeping with the adjoining Tower of London.

It is to be regretted that in so great an engineering work the architect should have lagged so far behind. Here was a splendid opportunity for architecture to assert itself, but the opportunity has been lost, and the engineer remains master of the situation.—I am, &c.,

Ellis Marsland, Hon. Sec.
Society of Architects, St. James's Hall,
Piccadilly, W.

Sir,—It appears to me that architects and engineers are frequently ignored at the public opening of important buildings. It is not long since the opening of the Imperial Institute, when it was observed that very little notice was taken of the able man who designed that splendid structure.

Last Saturday the eminent engineer who designed the Tower Bridge received the small honour of C.B., while the gentleman who has been chairman of the committee for three or four months, when the bridge was nearly finished, has been knighted; one was the son of an eminent architect, and himself a leader of his profession, while the other is said to be a member of a race which generally pushes forward, the German Jew.

It is an open secret that Mr. G. D. Stevenson prepared the drawings for Sir Horace Jones, and on the death of the latter he was engaged by the Corporation to prepare the details, but not one daily paper, so far as I know, mentioned his name.—I am, &c.,

Honour to whom Honour is Due.

RE ALL SAINTS' CHURCH, NORFOLK-SQUARE, PADDINGTON.

Sir,—In the Wayside Notes of your issue of the 29th ult. reference is made to certain works in progress at the above church, recently destroyed by fire, which work is being carried out by Mr. William Whiteley, of Westbourne-grove and Queen's-road. As you have evidently been seriously misinformed about the matter, I trust you will kindly allow me, in my capacity of building manager to Mr. Whiteley, to endeavour to remove certain misapprehensions of those correspondents referred to by you.

In the first place, no order has yet been issued for *rebuilding* the church, instructions up to the present time being the "pulling down and removal of *débris* only."

In the second place, the work is under the directions of an architect of prominence, representing the churchwardens.

Should Mr. Whiteley be instructed to "rebuild" the church, he will doubtless further prove his claim to the title of builder, which he has demonstrated in so unmistakable a manner during the past twenty years.

In conclusion, allow me to say that Mr. Whiteley employs the most skilled labour in all branches of the building trade, at highest London prices, and retains the services of thoroughly qualified architects and surveyors to represent him where required.—I am, &c.,

T. W. Willson, Building Manager.

SEWAGE DISPOSAL.

Sir,—I presume that the letter of "C. F. M." in your last issue was written in order to emphasize the condemnatory remarks of M. Pasteur about sewage farms. Permit me to point out that I was the first to publicly endorse these remarks in a paper read by me before the Chester meetings of the Incorporated Association of Municipal Engineers, on May 14th, on "The Eaton and Eccleston Sewage Precipitation Works," which was fully reported in several of your contemporaries.

M. Pasteur's remarks are directed against farming with *raw* sewage. It has been proved that sewage contains the germs of nearly all those terrible diseases which even now, with all our sanitary wisdom, keep the doctors busy and the hospitals crowded. To irrigate crops with raw sewage, to feed cattle with those crops, and then to allow the sewage-fed cattle to serve as human food (or, what is worse still, to allow sewage-grown farm produce to serve as human food)—such downright suicidal methods of sewage disposal should be prohibited by the State. When a few more men such as Pasteur will speak out openly, people will pause and reflect, and the present sewage farm mania will subside.

I have been for a number of years past an advocate of *sterilisation* as a *sine quâ non* of sewage treatment.—I am, &c.,

Albert Wollheim, Assoc.M.Inst.C.E.
Leadenhall House, London, E.C., July 2.

* * *

Mr. Ralph Nevill, F.S.A., of 89, Chancery-lane, has been appointed architect for the new church of All Saints, Norfolk-square, that is to replace that recently destroyed by fire.

On 5th May, the Burns Statue at Adelaide, S.A., was publicly unveiled. It is of Angaston marble, and is erected on a pedestal of Monato granite. The site is the eastern end of the reserve, opposite Government House domain. The statue stands 13ft. 6in. with the pedestal, and the figure is life-size, and the garb in which Mr. Maxwell, the sculptor, has chosen to represent the poet is the coat with brass buttons, buckskins, and top boots.

The committee of the University Hall settlement in Gordon-square have been for some time engaged in the consideration of a new building scheme, as the premises in Marchmont-street used for lectures have grown too small for the social work carried on there. Mr. Passmore Edwards has generously come forward with a promise to give the necessary building for the new hall, on condition that a suitable site is otherwise provided.

The foundation-stone of a Masonic hall was laid in Mint-street, Lincoln, last week. The building will provide on the ground-floor level a banqueting room, with a kitchen, lavatories, &c. On the first floor is an office for the transaction of provincial business, while the front is taken up by a lodge-room and ante-rooms. The elevation is in a quiet type of Georgian, in local red bricks, with Ancaster stone dressings. The building, which will cost about £1,400, is being erected by Messrs. H. S. and W. Close, from the designs of Messrs. W. Mortimer and Son, of Lincoln.

On Thursday in last week, the Archbishop of York opened the new church of St. Peter, Norton, Malton. The whole building, as provided for in the plans of Mr. C. Hodgson Fowler, of Durham, is not yet completed, there being yet to add a western tower. The church, as built, consists of chancel, south chapel, and nave, and provides sitting accommodation for 430 persons, which is in excess of that afforded by the old parish church. When completed, the church will have fixed sittings for 700 adults. Under special faculty, the fine organ presented to the parish church has been removed therefrom, and placed in the new organ chamber in the north side of the church. The total cost has been £8,000.

Intercommunication.

QUESTIONS.

[11175.]—**Stonehenge.**—Will some of your readers give their opinions on the date of this group of stones, as books and antiquarians differ on the point?—Sarum.

[11176.]—**Payment for Quantities.**—In the event of a contractor refusing to pay for quantities, the fees for which have been included in the usual way in the amount of his contract, and which are payable to the quantity surveyor on receipt of first certificate, has the surveyor any legal remedy against the contractor? I may say that the surveyor was engaged to take out the quantities by the architect on behalf of the proprietor, and the contractor has had several certificates.—Subscriber.

REPLIES.

[11170.]—**Fireproof Cement.**—Has "Z." ever tried Stourbridge clay mixed as mortar, and used in a similar way, as it will resist very great heat?—H. L.

[11173.]—**Ink on Drawings.**—1. Has "Student" tried a wet sponge to remove the ink?—almost any erasure would show. 2. Use ox-gall, which can be obtained in pots from any artists' colourman. 3. A slight entasis would much improve the appearance of a furnace chimney shaft. 4. Tall slight buildings would rock; but not fairly substantial ones.—H. L.

[11174.]—**Textbooks on "Materials."**—Most of the best books are given in the lists mentioned. "W. H. O." would obtain nearly all the necessary information from Rivington's "Building Construction," and the book by Major Seddon.—H. L.

CHIPS.

In pursuance of their policy of improving their Cornwall system, the Great Western Railway directors are about to carry out alterations and additions at Scorrier Station, and also the reconstruction in stone and iron of the viaduct over the River Hayle, near St. Erth.

The very small collection of Egyptian antiquities in the Museum and Art Gallery at Birmingham has been enriched by the presentation of two mummies and two mummy cartonnages, painted and partially gilt. The mummies were discovered by Mr. de Morgan, of the Gizeh Museum, near Cairo. One of the mummies is contained in a large cedar-wood coffin, and is that of a woman, who was mummified during the 26th dynasty, about 750 B.C. The coffin is covered with a coating of plaster, and inscribed with figures, sepulchral deities, and hieroglyphs in yellow, on a black ground. The other mummy, of the Græco-Roman period, about 300 A.D., is an example of diagonal wrapping, decorated with gilt and terracotta studs. This is the figure of a man. The two cartonnages, both brilliantly painted, one of them with the face covered with gold leaf, are of the same period.

New board schools are being erected at Bodmin from designs by Mr. W. J. Jenkins. Messrs. Brown, Son, and Grose are the contractors.

The Leeds city council decided on Wednesday to apply to the Local Government Board for sanction to borrow £18,000 for providing four infectious diseases hospitals at Manston.

Mr. R. Walton, an inspector from the Local Government Board, held a public inquiry on Friday at St. Annes-on-the-Sea, with reference to an application made by the local board for powers to borrow £2,090 for the provision of public offices, £1,296 for the erection of public slaughter-houses, and £3,794 for works of sewerage. Mr. G. Pickup, the architect for the proposed local board offices, exhibited and explained the plans.

The memorial stone of a new Church institute and Sunday-school for Yeadon was laid on Saturday. The new building, from the designs of Messrs. T. H. and F. Healey, architects, of Bradford, will comprise a gymnasium, young men's room, four classrooms, and assembly hall, accommodating nearly 400 persons. The site was formerly occupied by a Wesleyan chapel (built in 1766), in which John Wesley once preached.

Mr. Charles Carter, surveyor, of Marlow, died at Louvaine, Belgium, on the 28th ult, aged 66 years, surviving his wife, who was three years his junior, by little more than three weeks.

Earl Stanhope, Lord Lieutenant of Kent, laid the foundation-stone of the new church of All Souls', Cheriton, near Shorncliffe, on Tuesday week. The edifice is being built at a cost of £4,000, under a bequest of the late Mrs. Catherine Thompson.

A replica of an old Celtic cross at Kilklispeen, in co. Kilkenny, has just been erected at Staines over the remains of the late wife of the Rev. J. H. Armstrong, who for the last twenty-one years has been the vicar of the parish. The cross, a four-holed one, with a circle round the intersections, is a monolith of blue Pennant stone, resting upon a die of the same material. The face of the cross is carved in geometrically-arranged strap ornament. The memorial is by Messrs. Harry Hems and Sons, of Exeter.

Legal.

WIDENING OLD STREETS.

It frequently happens that in building new premises the frontage line of the old houses is put back, and so the pathway is widened, and the whole street is improved for business purposes. This has happened to some extent in the High-street, Kensington, where the vestry, for the purpose of widening the footway, gave notice to the owner of a public-house of their intention to take, by compulsory purchase, a portion of his premises—namely, a stone porch, step, and cellar-flap, all of which projected beyond the line of the house itself, and were practically an obstruction to the thoroughfare. This they did under the powers of Michael Angelo Taylor's Act (57 Geo. III., c. 29), whereupon the owner objected, and required that the vestry should take the whole house or nothing. In order to raise the question the owner applied to a Divisional Court for an interim injunction to restrain the vestry from going on with their proceedings to get the compensation payable for the part they wanted assessed by a jury in the ordinary way. In this action of "Gordon and others v. Vestry of St. Mary Abbott's, Kensington" (*Times*, June 26), the point at issue was whether the defendants could not take the portion they needed to remove this obstruction to the footway without taking the whole house.

As a matter of fact it could not be denied that the porch and step and cellar-flap were beyond and independent of the house itself. They had, indeed, been built some years ago, and were at that time in a line with the adjoining house; but owing to this having been set back in rebuilding, they were now practically an obstruction. It was argued for the owner that to take these away would seriously alter the whole character of the house, and it was urged on a point of law that the vestry could not deal in this way with what was alleged to be an integral portion of one building. On the other hand, as the judges pointed out, this question of value could be met by compensation, which the jury would award. They further held that as land could be divided—a front garden, for instance, could be cut off—so could an outbuilding or a portion of a house, the removal of which did not really destroy the identity of the house itself as a separate structure. In truth that was a question of fact for a jury to decide, when trying also the claim for compensation. So upon all grounds the Divisional Court refused the interim injunction asked, and left the matter to be fought out between the parties in the ordinary way in such cases, which will be before a jury upon the question of compensation.

Fred. Wetherfield, Solicitor.

1, Gresham Buildings, Guildhall, E.C.

Note.—All questions for reply in this column must be headed "Building News," and must reach my offices, as above, by *Tuesday* morning to insure answer same week.

◆

The trustees of the Public Picture Gallery Fund at Birmingham have just purchased, for presentation to the Museum and Art Gallery of that city, the original study, by Frederick Walker, of his widely-known picture "The Old Gate." This study, which is 48in. by 36in. was sold in 1875 in the Walker collection. This unfinished picture closely follows the lines of the completed work, but the figures, with the exception of two, are differently posed.

Mr. Stuart-Wortley's Committee, to which the London County Council Bill relating to Streets and Buildings has been re-committed, have this week been engaged in considering the question of the access of light and air to model dwellings and other houses inhabited by the poorer classes. Medical evidence has been given as to the necessity of regulations on this matter, and as to the action that had been taken in the past, in declaring as insanitary buildings that were deficient in this respect.

The North-Eastern Railway Company have in hand extensive improvements at their station in Leeds, and also on their line thence to a point some distance beyond Marsh-lane station. An important part of these works has been the demolition of Marsh-lane tunnel, which was about a mile long. That necessitated the removal of a number of buildings on the surface, as provision had to be made at this point (as along the rest of the track) for the widening of the railway by five new lines without a stoppage of the traffic. The work has been carried out by the contractors, Messrs. Whitaker, of Horsforth.

LEGAL INTELLIGENCE.

O'Brien v. Metcalfe.—The award of Mr. Philip E. Pilditch, the arbitrator in the case of "O'Brien v. Metcalfe," relative to the dilapidations accrued at Ashton House, Stevenage, in which the surveyors engaged on either side were Messrs. Walton and Lee and Mr. Charles E. Sayer, has just been published, the amount of award being £547 7s.

Arbitration as to Leith Dock Works.—Owing to the death of the managing partner, Mr. David Kinnear, Messrs. Kinnear, Moodie, and Co., the contractors for the Leith new dock works, ceased operations, after the work had been in progress for some months, and the contract was eventually secured by Mr. John Best, Edinburgh. Since that time Sir Alexander Rendall, advising engineer to the Dock Commission, and arbiter between the parties, has had under consideration the amount of work done, and has now issued his award, which is that the trustees of Messrs. Kinnear, Moodie, and Co. should receive the sum of £8,000 from the Commissioners for the harbour and docks for the work done and the plant laid down on the ground. Messrs. Kinnear, Moodie, and Co. lose several thousand pounds; but according to the conditions stipulated in the contract, the Dock Commission claimed the right to take over, without payment, the completed work and plant in the event of the contract being broken.

A Party-Wall Case.—Waynforth v. Nepforth.—This case was tried before Mr. Justice Wills in the Queen's Bench Division. It appeared that the owners of the London Music-hall in Shoreditch, having given notice and obtained an award under the Building Act, delayed to protect the plaintiff's stock, and the action was brought for compensation. Mr. A. J. Bullis and Mr. J. Clever, surveyors, gave evidence for the plaintiff; and Mr. H. Lovegrove, district surveyor, was called to prove that he had written complaining of the way in which the work had been executed as affecting the adjoining premises. Mr. E. Niblett, the architect of the music-hall, and Mr. Bruton were called for the defence. The jury decided that the award had not been carried out, and gave damages £70, with costs.

Building Act Case.—Lovegrove v. Kirk and Randall.—This case was in some respects similar to a case settled last year between the same plaintiff and defendants. The defendants erected an irregular building in the Goods Yard, Appold-street, Finsbury, for Messrs. Ingham and Co., the well-known brickmakers, and refused to give notice to Mr. Henry Lovegrove, the district surveyor, on the grounds that the building was exempt under section 6 of the Building Act, 1855. Mr. Shearman appeared as counsel, and called several officials of the London and North-Western Railway to prove that the structure was used for the purposes of the railway. The district surveyor conducted his own case. Mr. H. J. Bushby, the magistrate, after careful consideration of the various points, decided that the builders should have given notice, and imposed a penalty of 40s., with costs. The railway company asked for a case.

Libel Action against a Clerk of Works.—Hirst v. Smith.—This was an action brought by Mr. William Hirst, a contractor, carrying on business as the "Brunswick Rock Asphalte Paving Company," against Mr. J. T. Smith, for damages for libel contained in a report sent by him to the vestry of St. George the Martyr, Southwark. Upon the action being called on before Mr. Justice Mathew, on Saturday, Mr. Dickens, Q.C., upon behalf of the plaintiff, said he had undertaken large contracts for municipal bodies, and therefore it was of great importance that his character should be upheld. Mr. Smith was appointed clerk of the works, and as such made a report to the vestry which the plaintiff thought reflected on him, and suggested that he had scamped work upon which he was engaged for the vestry.—Mr. Robson, Q.C., upon behalf of the defendant, had undertaken to withdraw all imputations. All aspersions against the plaintiff were to be withdrawn, and there was not the slightest suggestion against him as to any of the work he did. Mr. Robson, Q.C., upon behalf of the defendant, said that no imputation of bad work or bad faith was intended upon Mr. Hirst. Mr. Smith wished most clearly to state that he did not use any imputation of bad work or bad faith.

Proceedings under Michael Angelo Taylor's Act. — Gordon and Others v. Kensington Vestry.—In the Queen's Bench Division of the High Court, last week, before Mr. Justice Cave and Mr. Justice Collins, this case was heard. The plaintiffs are the owners of the Town Hall Tavern, adjoining the Metropolitan Railway station, in High-street, Kensington, and the vestry, in order to widen the footway, require to take the portico of the house. The plaintiffs claim that the vestry should take the whole of the house, and have brought an action for an injunction to restrain the vestry from proceeding under various notices to take only a portion of the house. The question at issure was whether, under sections 80 and 82 of Michael Angelo Taylor's Act, 1817, the vestry could compulsorily take a portion of the premises without acquiring the whole. Their Lordships held that there was a question of fact, as to whether the taking away of the portico would make it necessary to alter the rest of the house structurally; and of this issue they could not dispose. But they could not grant an interim injunction in anticipation of the trial of the case. If, however, pending the hearing of the action the vestry proceeded to assess the compensation to be awarded to plaintiffs, they would do so at their peril. The motion was therefore refused.

Re Thomas Tucker.—The debtor, against whom a receiving order was recently made, states that from 1879 to 1888 he held various appointments, one as agent in England for an American elevator company, and another as manager of an hotel at Bournemouth; that for two years from 1886 he was employed by a theatrical manager in the construction of an hotel on the Victoria Embankment, and the debtor states this was the origin of his description as an architect, as he was not articled to the profession, but obtained such experience as he has from private study. Since October, 1893, he states he has assisted his wife in a business carried on by her. The liabilities are returned at £14,573, and the assets, consisting of cash, at £2. In the receiving order the debtor was described as of De Vere-gardens, architect and surveyor.

Brick v. Concrete Foundations.—John Stonnell, a builder, of Finchley, was summoned at Highgate Police-court last week for erecting a building in Huntingdon-road, Finchley, the footings of which were not resting upon a substructure of concrete, or some good hard substitute. The case for the prosecution was that plans for a building were submitted showing concrete foundations, but they were not otherwise in accordance with the by-laws, and they were not passed; but the defendant went on with the building—a dwelling-house; but instead of putting concrete footings, there were two rows of bricks. One of the outside basement walls was only 4½in. thick, when it should have been 9in. The soil was very bad in Finchley, being of very wet clay. Houses were now being underpinned because they had been built without proper footings. For the defence, Mr. George Blyton, F.S.I., of Finchley, said the cost of the bricks was much greater than concrete, and bricks were better. The wall of 4½in. was as thick as many in Finchley which were passed by the board.—Mr. Smythe, the Finchley surveyor, said 4½in. walls were not passed.—Mr. Williams (one of the magistrates) asked Mr. Blyton if he would not call 4½in. basement walls jerry building.—Mr. Blyton: Yes.—The Bench fined the defendant £5 and 5 guineas cost if the work was done in a month, but if the work was not done in a reasonable time, they would consider whether they should also inflict the continuing daily penalty of £2.

Is the Lord of a Manor the "Owner" of Land? — Re Christchurch Inclosure Act. — Meyrick v. the Attorney-General.—This case, on which Mr. Justice Stirling has now given judgment, raised an important question relating to the liability of Sir George Meyrick, the lord of the manor of Christchurch, to contribute to the paving expenses of a road constructed by the corporation of Bournemouth in respect of such portion of that road as adjoined a turf common originally forming part of the waste of the manor. The short point was whether the lord, in whom the soil of the common was vested, subject to certain public rights conferred by statute, was the "owner" of the land within the meaning of section 150 of the Public Health Act, 1875. The arguments in the case were concluded on the 6th inst., when his lordship reserved his judgment. Mr. Justice Stirling, in giving his considered judgment, first referred to section 13 of the Christchurch Inclosure Act, 1802 (42 Geo. III. c. 43), and to the inclosure awards made under this Act in 1806, and pointed out that it had been established by the decisions of the Court of Appeal and of the House of Lords that the soil of such a turf common was beneficially invested in the lord of the manor subject to the trusts imposed by the Acts in favour of the cottagers. It was also established by the decision of the Court of Appeal that the trusts in favour of the cottagers created by the Act were charitable trusts. The result, therefore, was that the soil of the turf common was vested in the lord of the manor, subject, as regards the surface, to certain charitable trusts. The Bournemouth Improvement Commissioners, now the corporation, in 1890 gave notices to the owners of lands bordering on the Ashley-road and North-road, requiring them to sewer, level, pave, metal, flag, and channel those roads. The roads adjoin the turf common, and the present lord of the manors was served with one of these notices. He did not do the work specified in the notice, and such work was done by the Commissioners at an expense of £188 0s. 7d. The question on the present summons is whether he is liable to the Corporation of Bournemouth for that payment. His Lordship then referred to section 4 of the Public Health Act, 1875, which defines "owner" as the person for the time being receiving the rack-rent of lands or premises, whether on his own account or as agent or trustee for any other person, or who would so receive the same if such lands or premises were let at a rack-rent. On behalf of the lord of the manors it was contended that he was not "owner" of the common within the meaning of the Public Health Act, 1875, inasmuch as the provisions of the Enclosure Act prevented the common from being let at a rack-rent. These provisions unquestionably interfered with the beneficial ownership of the lord to a material extent. He thought that the case of "Bowditch v. the Wakefield Local Board of Health" was a conclusive authority to show that a man was not the less the "owner" of premises because, by the provisions of the deed under which he held them, they could not, so long as he held them, be let at a rack-rent. The claim of the Bournemouth Corporation ought, therefore, to be allowed.

STAINED GLASS.

Lichfield Cathedral.—Some years ago the late Dean Bickersteth initiated the scheme of filling up the windows of the Chapter-house of Lichfield Cathedral with stained glass, in honour of departed worthies connected with the cathedral body, which should at the same time illustrate the principal incidents in the life of the patron saint, St. Chad. The first of these gives portraits of St. Chad and King Wulphere, with scenes of the consecration of St. Chad, and the Saint baptising the two sons of King Wulphere. The second contains figures of St. Oswald and St. Aidan, with representations of St. Aidan preaching to the Anglo-Saxons, and King Oswald interpreting; and St. Aidan at Lindisfarne, with his school of boys, St. Chad amongst them. Now the third of the series of memorials has been provided, and it is in memory of the late Dean Bickersteth himself. The widow contains figures of Theodore, Archbishop of Canterbury, who preferred St. Chad to Lichfield, and of Owina, the friend and companion of Chad. Beneath these figures two incidents in the life of St. Chad are depicted. The window has been designed by Mr. C. E. Kempe, of London.

CHIPS.

The Right Hon. James Bryce, M.P., will preside at the annual meeting of subscribers to the British School at Athens, which will be held at 22, Albemarle-street, on Wednesday next, at 6 p.m.

The new Board Schools, Poppleton, York, are being warmed and ventilated by means of Shorland's patent Manchester grates, the same being supplied by Messrs. E. H. Shorland and Brother, of Manchester.

The sale at Christie's, on Saturday, of the Adrian Hope collection realised £49,880, which is from 10 to 20 per cent. less than had been estimated. As has been mentioned elsewhere, two canvases by Berk Leyden and Jan Steen respectively, were acquired for the National Gallery, and a wild boar hunt in a woody landscape was bought for the Glasgow Corporation Gallery, the price being 1,660 guineas.

Mr. Newlyn, of Brixton-hill, having refused to pay the water-rate, because he was charged for a bath which he said he did not use, the Lambeth Water Works Company cut off the entire supply from the house. The dispute came before the magistrate at the South-Western police-court, and on Tuesday Mr. Rose decided that the company were wrong in cutting off the entire supply, and imposed a penalty of £12.

About a hundred and twenty men are at work on the site of ancient Troy uncovering the walls of what the late Dr. Schliemann's termed the sixth or Lydian city. There are indications of a gateway. A square well built of dressed stone has been found, and cleared to a depth of twelve yards. Various remains have been discovered.

The memorial stone of the first school to be erected by the Moss Side school board was laid on Saturday. Accommodation will be provided for 1,224 scholars, and the cost of the buildings will be £14,000.

The Dean of Bristol fixed, on Wednesday, the cup-stone of the restored central tower of Bristol Cathedral. Under Mr. J. L. Pearson's direction, the exterior face of the tower has been restored, and it has now been brought as near as possible to its original design and condition. Every stone which was defective has been replaced, the mullions in the upper stage of the tower have been entirely renewed and made of greater depth, so as to strengthen the inner portion; the pinnacles and parapet are for the most part new, though where possible some of the original work has been incorporated, the new portion having been carried out exactly on the lines of those taken down many years ago.

Our Office Table.

Although the walls of the National Gallery are obviously overcrowded with canvases, additions to the pictures continue to be made. The "Agony in the Garden," by Andrea Mantegna (1431-1506), recently purchased from the Earl of Northbrook, has been numbered 1417, and was hung on Monday, on the east wall of Room VIII., with the other works of the Paduan school. It is the fifth example of Mantegna's brush in the gallery, and measures 24in. in height by 32½in. in width. The colour is dark, but harmonises, and the draperies are, as usual, carefully treated. The scene is a landscape of immense laminated sandstone rocks, seen in warm twilight. In the mid-distance are the towers and walls of a fortified city, apparently intended for Jerusalem. On a pile of rocks the Saviour kneels, in the attitude of prayer; He is clad in voluminous brown robes, and His chestnut hair is arranged in large curls and is enriched by a nimbus. On the left, perched on a cloud, are five full-length angoletti, holding before the eyes of the Man of Sorrows, the cross, spear, sponge, nails, and other emblems of the Passion. The face of a cliff divides Christ from the three chosen Disciples, who lie on a ledge of rock wrapt in deep slumber, while behind the principal figure to the right a straggling procession of Roman soldiers is headed by Judas. A vulture sitting on a bare bough, and four or five hares disporting themselves on the roadside, a few palms and fig-trees, give variety to the scene. The picture is signed on the face of the rock below the Saviour, "Opus Andrea Mantegna." The sleeping figures in the foreground are strikingly like the simpler treatment of the same subject by Mantegna's brother-in-law, Giovanni Bellini, No. 726, on the south wall of the adjoining long apartment, Room VII.; there, however, the general treatment is simpler, and a single angel appears to the Lord, holding the emblematic cup. Several other pictures will shortly be hung in the Gallery, including two more from the Northbrook collection, one Early Flemish, the other by Messina, and three in the British School; while at the Adrian Hope sale on Saturday, the Directors and Trustees bought two Dutch works. One is a "View in Haarlem," by Gerrit Berkheyden, signed and dated 1674. This landscape, which measures 20½in. by 26in., and shows the church and numerous figures, cost 450 guineas, and is the first example of this master's work. The other is a "Scene on a Terrace, with Figures," by Jan Steen, 1626-79, and will be a third specimen of his work.

According to the financial statement submitted to the London School Board at their last meeting, the expenditure on repairs to buildings and furniture during the current year is estimated at £75,000. Last year it amounted to £90,499. About £20,000 of that amount, however, was abnormal expenditure for extra repairs. These repairs, which have been going on, more or less, during the past four years, have been rendered necessary by the imperfect nature of the original building work in many of the old schools, and more especially by the grave irregularities which have come to light in connection with their drainage and sanitary arrangements. Since the institution of a sanitary surveyors' department by the present board, the drainage and sanitary systems of a large number of old schools have been thoroughly overhauled and remodelled. The approximate cost of this work is at least £150,000. It is probable, however, that most of these extra repairs have now been carried out, and, consequently, a smaller provision only on this account need be made in the present estimate. A further reason for anticipating a smaller expenditure from maintenance account on repairs of this character is to be found in the fact that, where the cost of such work exceeds £250, the Education department now sanction its payment from loan account. It is, therefore, estimated that the total expenditure for repairs during the current financial year will not amount to more than £75,000.

The city council of Newcastle-on-Tyne adopted, at their meeting on Wednesday, a report from the town improvement committee, with regard to the best system of tramway haulage for the city. The committee came to the conclusion that the horse system of haulage is no longer able to meet the wants of the town, and that of the two other systems which have shown themselves practically successful—viz., electric and cable haulage, the cable system is better in every way, and most suited to Newcastle. Connected with the subject was a long report from the city engineer, Mr. Laws, who estimated that the cost of construction would be £10,000 per mile, the mileage worked (single) being 24 miles, and the length of route, 12 miles. He reckoned the probable earnings per car mile at 8·25d., and the probable expenses per car mile 4·5d., the average fare per passenger being 1¼d., and the average length of journey 1¼ miles. These figures are based on the working of the Edinburgh lines, and the probable number of passengers is estimated from the average of six large towns, including Newcastle. The council will therefore adopt the cable traction system of tramways as the best for Newcastle, and have instructed the committee to obtain, consider, and submit offers for the working of such a system in Newcastle, and estimates of the cost of construction.

There are, according to the *Philadelphia Press*, signs of movement in the tower of the Philadelphia City Building, and work has been suspended on the upper portion, so recently described and illustrated by us, until the substructure can be strengthened. According to Mr. Powell, the newly-appointed architect of the building, who seems to have been the first to discover the movement, and point out the true cause, the foundation and first story of the tower were well built, of perhaps sufficient thickness, with brickwork in cement. Above the first story, for some unexplained reason, the walls, although about 6ft. thick, were built, for several stories, with lime mortar, with a facing of marble ashlar, 12in. thick. Above the fifth story, a proper system of sound structure was reverted to, and thenceforth the brickwork was laid in cement. As the weight on the masonry increased, the natural result took place. The walls of the first story and basement, being laid in cement, kept their place, Mr. Powell having found no trace of settlement subsequent to the hardening of the cement. Where the brickwork was laid in lime, however, there has, of course, been no hardening. The mortar in the interior of the walls is still soft, and the compression of the joints, added to the shrinkage from evaporation, has not only caused serious settlement, but, by bringing the pressure on the thin, but almost incompressible, marble ashlar, has crushed and almost split this to an alarming extent. Mr. Powell has arranged to fill up some of the arches in the lower part of the tower, and in other ways distribute and equalise the weights, and to reinforce the masonry in lime with proper brickwork in cement; and it is much to be hoped that his efforts to stop further mischief will be successful. Considerable repairs on the lower portions of this tower had to be carried out nearly ten years ago, owing to carelessness of very similar character on the part of workmen or architect. At that time a considerable portion of carved and polished stonework had to be replaced because it had been cracked and crushed through the unequal settlement between the brick filling and the facing, the joints of the latter not having been laid slack enough to allow for the greater compressibility of the brickwork filling.

M. Richtenberger, in an article in the *Revue Bleue*, points out that the sum which is voted by the French Legislature for the Fine Arts is ridiculously small. Germany spends for Fine Arts more than £20,000, and England £32,000 a year; while France, for the galleries of the Luxembourg, Versailles, Saint Germain, and the Louvre, with its six departments, appropriates only £6,500 a year. Various attempts have been made, during the last ten years, to have the appropriation increased, but in vain, and there is no hope at present of getting any more from the State.

The Church of the Saviour, built at Borki, between Kursk and Kharkoff, in commemoration of the preservation of the Russian Imperial family in the terrible railway "accident" of November, 1888, has been consecrated in the presence of the Czar. The memorial consists of two structures, the one an oratory chapel built into the side of the railway embankment just where the dining-saloon car containing the Czar and his family was pitched by the accident, and the other a church in the Muscovite style of the 17th century, holding about 700 persons, built a short distance from the embankment out on the open steppe. The church is now surrounded by a park of about eighteen acres, in which have been planted 70,000 trees. The entire work has cost about £25,000, collected by public subscription. The church takes the form of a high cupola surrounded by six conical towers, the façades being in yellow bricks, with ornamentation, in which the double-headed eagle plays a conspicuous part. An iron staircase leads down from the railway on either side of the chapel. Professor Makofsky has spent two years and a half in decorating both the church and chapel.

The United States Government uses the following white preparation for painting lighthouses, and it effectually prevents moisture from striking through:—Take of fresh Rosendale cement 3 parts, and of clean, fine sand 1 part; mix with fresh water thoroughly. This gives a grey or granite colour, dark or light, according to the colour of the cement. If brick colour is desired, add enough Venetian red to the mixture to produce the colour. If a very light colour is desired, lime may be used with the cement and sand. Care must be taken to have all the ingredients well mixed together. In applying the wash, the wall must be wetted with clean fresh water, then follow immediately with the cement wash. This prevents the bricks from absorbing the water from the wash too rapidly, and gives time for the cement to set. The wash must be well stirred during the application. The mixture is to be made as thick as can be applied conveniently with a whitewash brush. It is admirably suited for brickwork and fences, but it cannot be used to advantage over paint or whitewash.

Mr. D. Charles Jones, the resident engineer at Wrexham in charge of the new line of railway now in course of construction between Wrexham and Ellesmere, died on Friday, after a short illness, from acute pneumonia. The deceased, who was only thirty years of age, had been with Mr. Alderman George Owen, the engineer to the Cambrian Railways, since he left school.

The scheme for the improvement of the Waverley Station at Edinburgh, on the North British Railway system, not only embraces new tunnels westwards and the widening of the line to Corstorphine, but the widening of the line eastwards to Abbeyhill, so as to improve the entrance at this end of the station. This contract has been let to Messrs. Watt and Wilson, Petershill, Glasgow. It involves a new double line from the Waverley Station eastward of the North Bridge, to the Calton rock immediately to the north of the west mouth of the existing tunnel, thence to the east mouth of the existing tunnel, a covered way along the slope, and a viaduct to Abbeyhill Junction. The cost of the works will be between £50,000 and £55,000.

At the last meeting of the Conway town council, a discussion arose on a letter received from the Society for the Preservation of Ancient Buildings, relative to the masonry of the castle, which, internally, was regarded as being dangerous. The borough surveyor contended that there was no place more dangerous now than it was 50 years ago. It was agreed that the estate committee should go over the castle with the borough surveyor, and advise what was requisite.

The Cheshire County Council discussed the other day the necessity for additional lunatic asylum accommodation, and also decided to enlarge Upton Asylum, Chester, so as to accommodate 416 additional patients. Plans for this purpose, prepared by Messrs Grayson and Ould, of Liverpool, were adopted, the estimated cost being £76,200, of which sum £62,400 is apportioned to the new buildings. Plans, prepared by the county surveyor, Mr. Stanhope Bull, were also adopted for new farm buildings at Upton Asylum at a cost of £2,650.

At Douglas, Isle of Man, on Friday, Messrs. Cain and Clarke, builders, were prosecuted by the Douglas Town Commissioners for having permitted a recently-erected house in Douglas to be inhabited without previously obtaining from an officer of the commissioners a certificate that the house was fit for habitation. The offence was admitted, and a fine of £1 and costs was imposed. The same defendants were, at the instance of the commissioners, also fined £1 for having deviated from the deposited plans in the erection of a house. This offence was also admitted.

The consecration of the newly-restored portion of the parish church of Newcastle, St. Illtyd's, Bridgend, took place on Thursday in last week. The restoration consists in the rebuilding of the chancel, which has been considerably enlarged, and the addition of a north chancel aisle to form an organ chamber and vestry. This work, which cost about £2,400, has been carried out by Messrs. Edward Rees and Son, Pencoed, from plans prepared by Mr. E. M. Bruce-Vaughan, of Cardiff. Special features in the new chancel are a stone reredos, and a stained-glass window dedicated to the memory of the late Dean Blosse.

MEETINGS FOR THE ENSUING WEEK.

Tuesday.—The Society of Architects. "The Architecture of the Rhine Valley," by G. A. T. Middleton, A.R.I.B.A. St. James's Hall, Piccadilly. 8 p.m.

The Society of Architects.

Founded 1884. Incorporated 1893.

The NINTH ORDINARY MEETING of the Society of Architects for the Session 1893-94 will be held at St. James's Hall, Piccadilly, W., on TUESDAY, JULY 10th, at Eight o'clock, p.m., when a Paper will be read on "THE ARCHITECTURE OF THE RHINE VALLEY," by Mr. G. A. T. MIDDLETON, A.R.I.B.A, illustrated with lime-light views.

ELLIS MARSLAND, Hon. Sec.
A. MONTEFIORE, Secretary.

CHIPS.

The late Mr. John Scott, of Hunslet, has left £10,000 for the building of almshouses in Leeds.

Some stained-glass windows have been placed in St. Mary's Church, Victoria-avenue, Wanganui. Messrs. Atkinson Brothers, Oxford-street, Newcastle-on-Tyne, were the artists.

Messrs. William Potts and Sons have obtained the order to make and erect the four-dialed illuminated turret clock for the Leeds new post-office. The clock is now in hand.

An organ built by Mr. Grindrod, of Rochdale, has been placed in St. Joseph's Roman Catholic Church at Heywood, Lancs.

A stained-glass window has been placed in Farsley parish church, in memory of the late Mr. John Wormald Appleyard, sculptor, who died in January last, aged 62 years. The window, which represents "The Crucifixion," was designed by, and executed during the lifetime of, the deceased.

The foundation-stone of St. Anselm's Church, Woodriding, near Pinner, was laid on Thursday in last week by the Earl of Strafford.

The Bishop of Rochester consecrated on Thursday in last week the Canon Hales' Memorial Church, erected in the Kew-road, Richmond. A special feature in the church is the seating arrangements by chairs movable only on hinges and intended to be permanent. The chancel yet remains to be built.

We understand that Messrs. Wm. Potts and Sons have been intrusted with the order to make and erect the four-dialled illuminated turret clock for the Leeds new Post-office. The clock is now in hand, and will be fixed as soon as the building is ready for the same.

The partnership heretofore subsisting between Henry Louis Florence and H. A. Satchell, architects and surveyors, of Verulam Buildings, Gray's Inn, W.C., under the style of Florence and Satchell, has been dissolved. Dissolution of partnership is also announced as between A. E. Dempster and R. Heaton, architects and surveyors, Birmingham, under the style of Dempster and Heaton.

The Openshaw public free library and municipal buildings are to be opened with some ceremony to-morrow (Saturday). The legatees of Sir Joseph Whitworth have intimated their intention to present a bronze medallion of the late baronet to be placed in the library.

The committee of the Home for Destitute Crippled Children at Newcastle have completed the purchase from the Gosforth Park Estate Company of two acres of land, on which they hope, at an early date, to commence erecting a new building. The purchase money is £1,300; but this is, of course, only the beginning of the outlay.

Six memorial-stones of a new Wesleyan Methodist Chapel, in process of erection at Woodside, Horsforth, were laid on Saturday. The new building, of which Messrs. Fairbank and Wall, of Bradford and Otley, are the architects, will be a simple treatment of Gothic in style, and have tower and spire. The chapel is to be 33ft. by 50ft., exclusive of transepts and choir. It will seat 315 people. There will be two vestries, an organ chamber, and a gallery to seat 90. The heating is to be by hot water on the low-pressure principle, while ventilation is to be obtained by means of air-pump ventilators. The cost is estimated at £1,850.

At the meeting on Tuesday of the Gloucestershire County Council the death of the county architect, Mr. James Medland, was reported, and it was agreed to appoint in his place his son, Mr. Henry Medland, who had recently acted for him. A long discussion arose on a proposal to accept the tender—the lowest sent in—of Mr. W. A. Forse, at £6,899, for the erection of a new meeting-room for the County Council, and the conversion of the present room into offices for the staff, which are much needed, the present offices being wholly inadequate for storing the documents and carrying on the business. On a division, the resolution to accept the tender was carried by 32 to 22.

Trade News.

WAGES MOVEMENTS.

Halifax.—The Halifax carpenters and joiners came out on strike on Saturday for an advance of wages from 7d. to 7½d. per hour, and certain alterations in the working rules. Six months' notice of the desired concessions was given last December, and this terminated on Saturday, when about 200 men ceased work. The masters have offered a farthing extra, which has been refused.

Jedburgh.—The wages of the journeymen masons in Jedburgh have been raised from 8d. to 8½d. per hour. One of the master builders is offering as high as 9d. per hour. The building trade here has been very brisk for several months past, and is likely to be so for some time to come.

Perth.—The slaters in this city struck on Monday for ½d. per hour increase.

The ceremony of laying a foundation-stone in connection with the Winson Green new Congregational Church took place on Saturday. The church, which will accommodate 700 persons, is being erected by voluntary labour, under the superintendence of Mr. T. E. Bicknell, of Smethwick, and the architect is Mr. George Ingall.

The death is announced from Paris of M. Jean Carries, the eminent sculptor and porcelain decorator. He was born at Lyons in 1856, and was a self-taught artist. In 1881 he began exhibiting busts which gave evidence of much power. At one time he suddenly disappeared for a period of two years, which he devoted to experiments in pottery; but he has died before being able fully to carry out his ideas.

A Local Government inquiry into the joint sewerage scheme for Bridgend, Tendu, and Aberkenfig was held at the Town-hall, Bridgend, on Wednesday week, by General Phipps Carey, the Bridgend local board seeking leave to borrow £9,000, and the Bridgend and Cowbridge rural sanitary authority £7,500.

The Mayor of Hastings, Mr. Alderman P. H. Tree, F.R.I.B.A., on Saturday night switched on the electric light to the whole of the Esplanade, extending for three miles from the Fish Market to the end of the Marina. The installation consists of fifty-two lamps, each of 2,000c.p. Thousands of people assembled on the piers and parades. Two mains are used for the lighting, and to prevent the failure of the current the machinery is duplicated.

The contract for the construction of the new docks at Barry, Glam., has been let to Messrs. Wills and Price, who were connected with Mr. Walker, by whom the contract for constructing the present docks at Barry was secured. The new dock will be a comparatively cheap one to construct, inasmuch as the existing entrance will be utilised, and thus the very great expense of any separate communication with the Bristol Channel will be obviated. Moreover, it is upon low-lying land, so that the work of excavation will not be onerous or difficult.

On the 13th June, in the Canadian Chancery Division Court, before Justices Boyd and Meredith, the appeal of Mr. Neelon, contractor for the new Toronto city buildings, from the decision of Mr. Justice Rose, who affirmed that the architect had authority under the contract to dismiss the contractor, came up for argument. The Court agreed with the construction put upon the contract by the trial judge, and dismissed the appeal with costs. Mr. Neelon intends to carry the case to the highest court of appeal.

At the annual meeting of the supporters of the Church House, held on Thursday in last week, the Archbishop of Canterbury asked for £15,000 by the end of the year in order that the new hall, now in course of construction from Sir A. W. Blomfield's designs, might be completed very quickly.

A new Baptist church erected in the Abbey-road, Malvern, was formally opened on Thursday in last week. The cost has been £4,500.

A new borough police-station is being erected at Reading, and special consideration has been given to the ventilation, which will be effected on the Boyle system, the latest patented improved form of the self-acting air-pump ventilator being adopted for the extraction of the vitiated air.

At Tuesday's meeting of the Liverpool School Board, it was decided to purchase a portion of land in Sir Thomas-street, near the Municipal Offices, at £20 per square yard, for the purpose of erecting board offices.

The German Emperor has granted the funds to the German Archæological Institute in Rome to enable it to carry out a scientific investigation, and to publish an account of the celebrated reliefs of the Column of Marcus Aurelius.

HAM HILL STONE.
The attention of Architects is specially invited to the Durability and beautiful Colour of this material.
Quarries Well Opened; Quick Despatch Guaranteed; Stonework Delivered and Fixed Complete. Samples and Estimates Free.
Address:—
THE HAM HILL STONE COMPANY,
NORTON, STOKE-UNDER-HAM, SOMERSET.
London Agent:—
Mr. E. A. WILLIAMS, 16, Craven-street, Strand, W.C.

BILLS OF QUANTITIES & PLANS.
T. PETTITT and CO. Lithograph Bills of Quantities with the greatest expedition. Accurately copied from the draft in clear hand. Orders from the country returned by evening mail on the same day. Terms on application. Also Plans of Building Estates and General Plan Work at very reduced prices.—T. PETTITT and CO., Lithographers, 28, Frith-street, Soho, London, W. Established 50 years.

WM. OLIVER & SONS,
MAHOGANY, WAINSCOT, WALNUT, TEAK, VENEER, and FANCYWOOD MERCHANTS,
120, BUNHILL ROW, LONDON, E.C.
The most extensive Stock of every kind of Wood in Planks and Boards, dry and fit for immediate use.

TENDERS.

*** Correspondents would in all cases oblige by giving the addresses of the parties tendering—at any rate, of the accepted tender; it adds to the value of the information.

Acton.—For the erection of a doctor's residence, stabling, fence walls, &c., on the north side of Pembridge-road, Acton, for Dr. A. Cayley Hutchinson, M.D., M.B., C.M. Mr. Edward Monson, jun., F.R.I.B.A., Acton-vale, W., architect. Quantities supplied:—

Dorey and Co., Brentford	£2,985	0	0
Godsen and Sons, Kilburn	2,800	0	0
Hooper, G., Acton	2,792	0	0
Nye, T., Ealing (accepted)	2,700	0	0

Barnet.—For entrance lodge, Barnet burial ground, for the trustees of the Barnet Chancel Estate. Mr. J. C. Traylen, 16, Broad-street, Stamford, architect:—

Pearson, M. A., Barnet	£704	10	0
James, W., Barnet	690	10	0
Butcher, T., New Barnet	670	0	0
Williamson, W. J., Finsbury Park	656	8	0
Voller, F., Wood Green	620	0	0
Willmott, J., and Sons, Hornsey	605	0	0
Lidstone, N., 96, Blacklock-road, N.	576	0	0
Powey, W., Winchmore-hill, N.	568	0	0
Halliday, S. F., Stamford, Lincs*	499	10	0

* Accepted.

Barry, Glam.—For the construction of the new dock at Barry:—
Wills and Price (accepted).

Beverley.—For new casual wards and porter's lodge, Beverley Workhouse. Messrs. Hawe and Foley, architects, Beverley. Quantities by Messrs. Hawe and Foley:—

Scales, G, Scarbro'	£2,321	0	0
Good, E., Hull	2,207	12	6
Pape, G., Beverley	2,000	0	0
Lyons, A., Malton	1,987	0	0
Greenlaw, H., Beverley	1,938	3	8
Foley, J. R., Beverley (accepted)	1,885	15	3

[Architects' estimate, £1,874.]

Brockley.—For the enlargement of the Mantle-road School, Brockley, by 394 places, and the provision of a cookery centre in connection with the school, for the London School Board:—

				A.		
Gregar, W., and Son	£12,760	0	0	£200	0	0
Longley, J., and Co.	11,598	0	0	185	0	0
Hart Bros.	11,340	0	0	183	0	0
Holliday and Greenwood	10,887	0	0	150	0	0
Lovatt, H.	10,825	0	0	124	0	0
Reed, A., and Son	10,785	0	0	150	0	0
Smith, J., and Sons	10,398	0	0	149	0	0
Kirk & Randall, Woolwich*	10,121	0	0	154	0	0

* Accepted.
A.—If brickwork be built in cement, add.

[(a) Cost of school buildings and closets, £6,007; (b) tar pavement, £353; (c) drainage, £522; (d) cookery centre, £453; (e) manual training centre, £1,502; (f) works to existing buildings, £758; (g) extra depth of foundations, £526; (h) add for brickwork to be built in cement, £154; total, £10,275. Cost of existing school, £9,183; of proposed enlargement, £10,275; total, £19,458. Total accommodation of enlarged school, 1,194; total cost per head of ditto, £16 5s. 11d.]

Bromley-by-Bow, E.—For redraining all departments of the Oban-street School, Bromley, for the London School Board:—

Dent and Hellyer	£1,414	0	0
Colls and Sons	1,380	0	0
Calnan, M., and Co.	1,325	0	0
Triggs, E.	1,085	0	0
Peattie and Axtell	1,045	0	0
White, F., and Son	1,009	12	0
Robey, J. T.	1,007	0	0
Gregar, W., and Son, Jupp-road, Stratford (accepted)	994	0	0

Birmingham.—For the completion of the Hockley Brook improvement, for the joint committee of the Birmingham city council and the Aston local board:—
Jones & Fitzmaurice, Birmingham ... £8,492 14 2
Accepted.

Birmingham.—For the erection of additional stabling and granary at Hollady-street Wharf, for the Birmingham city council:—
Fenwick, R., Birmingham (accepted) ... £6,095

Bromley-by-Bow, E.—For reconstructing skylight over hat and cloak-room in the Bromley Hall-road School, for the London School Board:—

Calnan, M., and Co.	£95	10	0
Derby, A. W.	74	0	0
Gibb, D., and Co.	62	0	0
White, T., and Son	59	18	0
Corfield, S. H.	59	0	0
Robey, J. T., Bow-road (accepted)	58	10	0

Bromley, Kent.—For the erection of a house in Bromley Park, Kent, from the plans and specifications prepared by Mr. William H. Duffield, A.R.I.B.A., 34, Queen-street, Cannon-street, E.C., architect. Quantities supplied:—

Patman & Fotheringham, London	£1,951	0	0
Parkey, Peckham	1,825	0	0
Payne, Bromley	1,798	0	0
Lowe, Chislehurst	1,715	0	0
Grubb and Sons, Bromley	1,671	0	0

Bury, Lancs.—For fittings in the chemical laboratory of the technical schools, for the town council:—
Halstead Brothers, Eastwood, near Todmorden (accepted).

Carlton, Wilts.—For additional buildings to Manor Farm, for Capt. T. E. Fowle. Mr. James H. Money, architect. No quantities:—

Huntley and Sons, Honey-street	£452	0	0
Ash, H., Devizes	299	10	0
Toomer, F., Salisbury	293	0	0
Whatley and Co., Pewsey	265	0	0

Charlton, S.E.—For the erection of a school on the Maryon-park site, Charlton, to provide accommodation for 789 children, and also cookery and laundry centres on the site:—

				A.		
Green, T. L.	£21,385	0	0	£559	0	0
Boyce, T.	21,328	0	0	480	0	0
Marsland, J.	20,966	0	0	450	0	0
Lathey Bros.	20,931	0	0	400	0	0
Lovatt, H.	20,856	0	0	356	0	0
Lawrance, E., and Sons	20,623	0	0	401	0	0
Stimpson and Co.	19,940	0	0	530	0	0
Nightingale, B. E.	19,917	0	0	357	0	0
Kirk and Randall, Woolwich	19,244	0	0	445	0	0

A.—If brickwork be built in cement, add.

[(a) Cost of school buildings and closets, £11,744; (b) tar-pavement and playgrounds, £2,689; (c) boundary walls and gates, £1,600; (d) two teachers' rooms, £200; (e) schoolkeeper's house and cookery centre, £1,352; (f) laundry centre, £589; (g) extra depth of foundations, £1,070; (h) add for brickwork to be built in cement, £445. Total, £19,689. Cost per head of (a) only £14 17s. 8d.]

Chelsea.—For general repairs, painting, distempering, and sanitary work at the Chelsea Infirmary, for the guardians of St. Luke, Chelsea. Messrs. Lansdell and Harrison, 12, Compton-terrace, Highbury, N., architects:

Lapthorne and Co.	£697	0	0
Cridlan	595	0	0
Wade	574	15	0
Foxley, G., 36 & 37, King-street, Regent-street, W. (accepted)	555	0	0

Chelsea, S.W.—For works of redrainage at Walton-street board school, for the London School Board:—

Beattie, R. P.	£604	0	0
Humpherson and Co.	584	0	0
Foxley, G.	580	0	0
Kent, G. and F.	539	0	0
Davis, J. E.	528	0	0
Winser and Co.	525	0	0
Polden, S.	519	0	0
Star and Son	495	0	0
King, H., and Sons, Fulham-road*	348	0	0

* Accepted.

Clapton, N.E.—For enlarging Millfield-road schools, Clapton, now in course of erection, by 587 places, for the London School Board:—
Shurmur, W. (accepted) on schedule of prices.
[Contractor for building in progress.]

Clerkenwell.—For the erection and completion of new armoury and officers' divisional quarters at Clerkenwell, E.C., for the 3rd Middlesex Artillery Volunteer Corps. Mr. C. I. C. Pawley, 2, Princes Mansions, Westminster, S.W., architect. Quantities by Mr. Henry Bushell, F.S.I.:—

King, W., and Son	£1,258	0	0
Langdale, Hallett, and Co.	1,200	0	0
Prestige and Co.	1,159	0	0
Holloway Bros.	1,112	0	0
Turtle and Appleton	1,060	0	0
Battley, Sons, and Holness	997	0	0
Hawkins and Wright*	888	0	0

* Accepted conditionally. All of London.

Crystal Palace.—For painting and renovation to the Crystal Palace Station, for the London, Brighton, and South Coast Railway Company. Mr. F. D. Banister, engineer:—
Richardson, J. O., Albert Works, Peckham ... £1,979
Accepted.

Crouch End, N.—For sewers at Topsfield Estat Crouch End, N., for the Hornsey local board:—

Killingback and Co., Camden Town	£8,765	0	0
Cooke, B., and Co., Battersea	8,505	0	0
Dunmore, T. G., Crouch End, N.	7,884	10	6
Jackson, J., Plaistow	7,764	17	6
Hudson, S., Streatham Hill Station	7,699	6	4
Wilkinson Bros., Finsbury Park	7,619	0	0
Griffiths, W., 283, Kingsland-road	7,329	9	0
Adams, T., Wood Green, N.	7,138	12	6
Dickson, J., Townsend, St. Alban's*	6,266	17	0

* Accepted.

Dudley.—For iron fencing on the new road to Netherton, for the town council:—
Hill and Smith, Hart's Hill (accepted).

East Croydon.—For fittings required at new sorting office, Cherry Orchard-road, East Croydon, for Her Majesty's Office of Works. Mr. John Tosh, architect:—
Richardson, J. O., Albert Works, Peckham ... £188
Accepted.

East Dulwich, S.E.—For providing a complete new system of heating for the Heber-road School, East Dulwich, for the London School Board:—

Maguire and Son	£683	10	0
Dawson, R., and Co.	610	0	0
Parries, H., and Harris	581	10	0
Wontner-Smith, J., Gray, and Co.	580	0	0
Rosser and Russell, Limited	577	0	0
May, J. and F.	575	0	0
Pearson, R. H. and J., Limited	560	0	0
Berry, Z. D., and Sons	549	0	0
Wenham and Waters, Limited	495	0	0
Fraser and Son, Millwall (accepted)	389	0	0

Edinburgh.—For widening the North British Railway system from Corstorphine to Abbey Hill:—
Watt and Wilson, Peter's-hill, Glasgow (accepted) about £60,000.

Fulham.—For stables, &c., at Burlington-road, Fulham, for the London General Omnibus Co., Ltd. Mr. Percy W. Britton, Assoc.M.Inst.C.E., engineer:—

Perry and Co.	£4,218	0	0
Holliday and Greenwood	4,113	0	0
Downs	4,097	0	0
Knight	4,069	0	0
Ansell	3,700	0	0
Richardson, J. O.	3,570	0	0
Wall, C.	3,465	0	0
Parker	3,395	0	0
Evans, R. and E.	3,389	0	0
Evans, H. D.	3,345	0	0
Wilkinson Bros. (accepted)	3,271	0	0

Gloucester.—For the erection of a meeting-room and offices, for the county council:—
Forse, W. A. (accepted) £6,899 0 0
[Lowest tender received.]

Harlesden.—For building six shops, High-street, Harlesden. Mr. L. V. Hunt, A.R.I.B.A., 35, Queen Victoria-street, E.C., architect. Quantities by Mr. G. Fleetwood, F.S.I., 15, Furnival's Inn, Holborn, W.C.:—

Whitehead, L., and Co.	£5,750	0	0
Oldrey, H. B., and Sons	5,735	0	0
Holloway Bros.	5,645	0	0
Easterbrook, J.	5,561	0	0
McCormic and Son	5,487	0	0
Bowyer, J. and C.	5,412	0	0
Cowley and Drake	5,350	0	0
Scrivener, W., and Co.	5,232	0	0
Tennant and Co.	5,179	0	0
Gould and Brand (accepted)	4,945	0	0

Hastings.—For electric-light wiring at the Queen's Hotel, Hastings, for the Queen's Hotel Company, Hastings, Ltd. Mr. Arthur Wells, F.R.I.B.A., Queen's Chambers, Hastings, architect and surveyor:—

Spiers and Pond	£510	0	0
Belshaw and Co.	448	0	0
Hastings Electric Light Supply Co.*	358	13	4
Strode and Co.	343	0	0
Roger, Dawson, and Co.	300	0	0
Raynes, Smith, and Co.	269	10	0
Fowler, Lancaster, and Co., Birmingham	265	0	0

* Accepted. Rest of London.

Hastings.—For electric-light fittings and fixing at the Queen's Hotel, Hastings, for the Queen's Hotel Company, Hastings, Ltd. Mr. Arthur Wells, F.R.I.B.A., Queen's Chambers, Hastings, architect and surveyor:—

Barker, J., and Co., London	£411	0	0
Strode and Co., London	346	11	0
Hastings Electric Supply Co.	345	18	4
Hands, London	310	9	9
Verity, B., and Co.	306	19	0

Hastings.—For repairs, alterations, and improvements at the Queen's Hotel, Hastings, for the Queen's Hotel Company, Hastings, Ltd. Mr. Arthur Wells, F.R.I.B.A., Queen's Chambers, Hastings, architect and surveyor:—

Salter, T., Hastings	£2,279	0	0
Lester, J., Hastings	2,277	0	0
Cruttenden, H. E., Hastings	2,195	0	0
Jenkins, P., Hastings*	1,995	0	0

* Accepted, at schedule.

Hastings.—For decorative and sundry other works at the Queen's Hotel, Hastings, for the Queen's Hotel Company, Hastings, Ltd. Mr. Arthur Wells, F.R.I.B.A., Queen's Chambers, Hastings, architect and surveyor:—

Collinson and Lock, London	£2,122	4	8
Smee and Cobay, London	2,100	15	6
Lester, J., Hastings	1,990	0	0
Crossley, J., London	1,820	13	0
King, H., London	1,770	0	0
Cruttenden, H. E., Hastings	1,769	0	0
Miller, S. P., Hastings	1,753	5	5
Jenkins, P., Hastings	1,675	0	0
Lancaster, H., Hastings	1,500	0	0
Barker, J., and Co., London*	1,497	0	0

* Accepted, at schedule.

Hastings.—For fibrous plaster decorative work at the Queen's Hotel, Hastings, for the Queen's Hotel Company, Hastings, Ltd. Mr. Arthur Wells, F.R.I.B.A., Queen's Chambers, Hastings, architect and surveyor:—
Jackson, G., and Son, London (accepted) £101 0 0

FRIDAY, JULY 13, 1894.

WHAT ARE COMPETITIONS COMING TO?

THE architectural world might conveniently be divided into competitors and non-competitors, while each of these classes, again, splits up into several sub-divisions. The architects who refuse to compete differ widely amongst themselves. There are those who are fortunate enough to be, and always to have been, independent of speculative work. They have succeeded, perhaps, to an hereditary practice, and their name is a source of income in itself. There are others who, with no special advantages and no special abilities, have been equally prosperous. All their lives long they have firmly grasped the fact that what their neighbours really care about is not architecture at all, but politics or religion. To produce architecture worth the name is difficult, and the producer perhaps is in the end only casting pearls before swine; but to stick to a party or a sect through thick and thin is easy, and it pays. The prudent man, therefore, with nothing to sell but his soul, sells that, and lives in comfort on the proceeds. The great point is to decide at the outset whom to sell it to. This is a serious matter of business, far too important to be interfered with by personal beliefs or preferences. The only question is, what party bids fair in the long run to pay the best price. The prudent man enters on life by joining *that* party. He drudges for it, he touts for it, he votes for it; he defends its abuses, flatters its members a step or two above himself, and in time comes to be acknowledged as an earnest young man, with principles of the right sort. The party feels that such a young man ought to be encouraged. They make him a delegate, or a secretary, or something else that involves much labour, with apparently little reward. But he does not draw back, for he knows that things are not what they seem. He is getting better and better known; he is getting more and more opportunities of introducing himself; he is becoming trusted, as only that man can be who never admits that he is wiser to-day than he was ten or twenty years ago. Work comes in to his office; his engagements with his party leave him little time to do it, even if he knew how; but in these matters money answereth all things. If his party bring work in, his clerks can turn work out, so he farms them and reaps the profits. Thus he is able to subscribe more and more to his party's funds. It is in this, as we all know, that true greatness consists. Henceforth, therefore, his rise is rapid. He presides at public meetings; he becomes a permanent vice-chairman, and at last a chairman. By this time, perhaps, he has made a fortune and retired. But if he has not, though his profession has hardly heard of him, and though his works may be a disgrace to the town which contains them, his own party, and perhaps even a section of the public outside it, are firmly convinced that he is the greatest architect known.

What some men accomplish by doing the work of a party, others effect by elbowing their way into "Society." They meekly submit to being snubbed, that they may ultimately snub others, and take kicks first in hope of halfpence after. A vulgar proverb declares that we must each eat a peck of dirt before we die; but these people eat a waggon-load. Everyone to his taste, and much good may it do them! Barbarous indeed would the person be who grudged them their reward; and if at last they, too, obtain a steady influx of commissions, we must remember what they have gone through to secure it. But there are other non-competitors besides these, and non-competitors of a very different sort. Our ablest men, who have gained high positions through eminent talent and honest work, not only refrain, as a rule, from competing, but often advise others to refrain too. It is very natural. They find themselves where they wished to be, and they forget, or half forget, that it was success in some great competition which chiefly put them there. It is well that they should rest and be thankful. It is fair that they should be satisfied with using the many opportunities which now spontaneously come to them. A competition is, in one aspect of it, a fight for work. Those who have as much work as they can well get through, act both rightly and generously in declining to compete for more. But if there were no more competitions, there would be few more chances for ability. Hereditary practices would remain—perhaps one in a dozen adorned with hereditary talent, but most with only the shade of a great name. Party hacks would prosper, society-stormers would succeed, but men with mere artistic gifts would live and die unheard of.

Competitions, then, seem to be a necessity—at least, for our times, and perhaps for a long period after. We have no other way, save by rare accidents, of bringing the best men to the front. If competitions fail in doing this, they fail altogether; and their failure in this has for some time past been growing more and more conspicuous. Happily, they do not all fail. One here and there is, or promises to be, a marked success. There is no reason why all, or nearly all, should not be the same. The fault does not lie with the competitors. Never, at least in the present century, have they shown more ability than now. The fault lies in the conditions under which they compete; and till these conditions are altered, we may look forward with certainty to more mistakes—more unwise selections—more and more contests in which the worst man wins.

How do the promoters of a new building initiate a competition? Very often, of late years, by a piece of sharp practice which borders closely on fraud, and which might easily lapse into it. They advertise that copies of their Instructions to Competitors will be sent on receipt of two guineas, or sometimes more, from each applicant; and that this sum will be returned on receipt of a *bonâ fide* design prepared in conformity with the instructions. It is not till after you pay your money and see the instructions that you really learn what you must do to get it back; how many drawings you have to make, how large the scale is, and how soon they have to go in. An enterprising person might easily raise a few hundred pounds on this system. He has only to ask for a large number of drawings, say, to inch scale, and to insist that they shall be delivered within a week, and all the fees he received would become his own. The Courts of law, if they were moved, might or might not interfere in such a case; but it would not be worth the while of one individual architect to begin an action on the doubtful chance of recovering two guineas—and we all know that architects will suffer greatly rather than combine. These entrance fees were probably first suggested by the fact that a deposit is sometimes required, under the advertisement system, from contractors wishing to tender. That, however, is a totally different matter. A set of lithographed bills of quantities for a large building actually costs, for lithographing alone, as much, or more, than the deposit asked for. The set may run to hundreds of pages; the labour of packing it, and the cost of postage, moreover, are considerable, and a committee can hardly undertake to issue copies of it gratis to every unknown person who may be curious enough to apply for one. But where a set of quantities costs a guinea for lithographing, a set of competition rules only costs, perhaps, twopence or threepence for printing, and it goes in an ordinary envelope, with a penny or three-halfpenny stamp. The first building committee who found that there were hundreds of men going about at large, and yet ready to send a couple of guineas for a set of twopenny instructions, must have felt that they had never before fathomed the fatuity of their fellow-mortals. It is true the guineas are to be returned on receipt of a *bonâ fide* design. But what architect with any work of his own knows whether he will or will not, after all, have time to make one? If he has, well and good; but if more pressing matters intervene, he either loses his deposit through not competing, or he swells the number of competing designs by a crude, worthless set of plans, sent in simply to get back the money. So it comes to pass that this deposit-system, which is in the one case little better than a barefaced robbery, is in the other case a direct incentive to the sending in of worthless rubbish, which overwhelms by its bulk the minority of skilful and well-studied schemes. Architects give quite enough when they give the time, thought, and expense which every competition involves; it is rather hard to insist on their giving money also—and money which lessens, instead of increasing, the chances of a meritorious design. But now committees have once tasted blood, many of them will continue to hunger for it. If they do, it would be better for all parties that architects should be bled in moderation. Let the instructions for a competition be sold outright to every applicant, say, for only ten or twelve times the actual cost of each copy, and let no money be returned. At the price of half a crown committees would still realise a handsome profit, and they would no longer be tempting competitors without experience or position to inundate them with trash in order to get back money that should never have been asked for.

So much for one cause of failure. Others, still more serious, often arise from the "instructions" which competitors receive. It is a rule, with very few exceptions, that the promoters of a building ask for much more accommodation than they are willing to pay for. This is an evil which grows worse and worse. All the world knows that laws of increasing stringency are being made every year about sanitary matters. Walls have to be thicker than formerly—if not in London, at least in many other places. Sites have to be freed from decaying substances; the whole area of buildings has to be concreted over; drains have to be disconnected and ventilated, and have in many towns to be soundly bedded on a concrete foundation: and a multitude of other things—useful enough, but not compulsory till in recent times—have everywhere to be done. In public buildings of several kinds the regulations about ingress, egress, air-space, water supply, and protection against fire involve yearly a heavier and heavier cost, and while all buildings have thus to be carried out in a more expensive way than formerly, the cost of labour also tends to rise higher and higher. Shorter hours and higher wages cannot be expected to make building cheaper, though they ought to make it better; and we may say, in passing, that workmen would receive, both from architects and the public, a great deal more sympathy than they do at present if they agitated not only for better pay, but also for better work. But, returning to our competition "instructions," it is high time for committees to recognise that modern improvements of every kind cost money. Buildings cannot be put up now at the same rate as they were twenty years ago. There is nothing gained in the long run by telling competitors that they must provide a £10,000 hall, or college, or school for £9,000, or £8,000, or perhaps even £7,000. They do not do it, though some of them, perhaps, may send in designs which promise to do it. But the promoters reap no benefit in this way. They have asked for an impossibility: the author of the design they select may have hoped, and may have told them that he hoped, to accomplish the impossibility; but it will not be accomplished. If the committee happen to be rather below the average of men as to conscience—a state of things which sometimes goes along with an inward sense of being considerably above them in that important matter—they may hereafter abuse their architect, and rob him of his time and trouble. Perhaps they have put a clause in their "instructions" which, as far as law is concerned, will bear them out in doing so. But it will not make their conduct just; and, above all, it will not give them their £10,000 building for their £9,000, or £8,000 or £7,000. Then why not act fairly at first, and either enlarge their estimate or reduce their requirements? Unless they do, they will be impaled on the usual dilemma, when they come to make their choice of a design—the dilemma of selecting a wretchedly poor scheme because of its cheapness, or a better one which will cost 20 or 30 per cent. beyond the stipulated amount. This dilemma is a second and ever-recurring cause of failure in competitions.

It happens, not very unfrequently, that the outside observer, startled by the extreme badness of the designs which have carried off the first, second, and third premiums in a competition, looks for the names of the authors, and understands the matter at a glance. The most successful competitor, perhaps, has just built a house for the chairman. The two others, it may be, are friends of the promoters, or at any rate they are "local men." A glowing paragraph appears in the papers to the praise and glory of, let us say, the three Silchester architects who have brought out their town victorious at such mighty odds. The implication is, of course, that they have done it fairly, and that the Silchester Committee did not know whose plans they were choosing. We have certainly nothing to say against "local men" as such, whether their locality is in London or the provinces. Their local knowledge gives them—and fairly gives them—a considerable advantage over competitors from a distance. But this advantage should show itself in the production of better designs than outsiders can furnish. Now, in the case we are supposing—a case of which some examples are likely to be within our readers' recollection—the premiated designs by local men have been not better, but glaringly worse, than others. Yet, how is it possible, some too innocent person may ask, that with all the precautions about secrecy at present in vogue, any member of a committee should know the authorship of a design? Formerly designs were sent in under motto; but now not even mottoes are allowed. There is no passing a watchword of this sort to any of the promoters, since the designs, like prisoners in Siberia, are simply distinguished by a number, marking the order of their arrival. There is no knowing them either by their size, for in this they are all alike; there is no picking them out by their mounts, for mounts, as well as borders, are excluded; and, finally, there is no recognising them by the writing on them, for everything now has to be printed or type-written. Then, how can the promoters possibly tell which drawings were by their friends, and which by strangers? Their choice must have been an honest one, since, with all these precautions, they could not have known who was who.

So may reason some confiding soul, too good for this wicked world; and so, doubtless, the local committee hoped and believed we should all reason. Unfortunately experience has enlightened us. Good friend—we should say to this confiding person—the problem which baffles you is of the same order as that which puzzled the rustic who took cold after sleeping in the middle of a field. He had carefully shut the gate, latched it, and put the padlock on; and yet his illness seemed to show that there must have been a draught. How did it get in? Much in the same way as information about the names of their competing friends gets in amongst the promoters of a competition—that is, from every quarter except perhaps the one they have taken such precautions to close. For you must remember that it is only the two or three designs that their friends have submitted which the promoters need to recognise. They do not want to learn, and they do not learn till the competition is over, who are the innumerable outsiders, the "foreigners," as they are called in some Midland towns. As to *their* names, no one feels much curiosity. The vital matter is to recognise the work of personal favourites, of "respected townsmen"; and the ways in which this may be done are numberless. They need not be pre-arranged. There is no need for a code of signals, though a code is possible enough. The knowledge that a certain design is by a certain architect may come to the committee in a perfectly blameless way. Perhaps that architect is executing other work for some committee-man: he calls at the office, and by an accident gets a glimpse of that architect's design before it goes in. Perhaps there is a builder on the committee, who, in the same manner, has seen more or less of several schemes as they were being worked out in local offices. We remember a case of this sort in which, though more than a hundred sets of drawings were submitted under motto, all the principal ones were openly discussed under their authors' names long before the sealed envelopes were opened. This was in London, and what is possible there is much more possible in smaller places. Then, again, the way in which designs arrive makes some knowledge of their source inevitable. Those which come with a main-line railway label, and a notice that they are to be delivered immediately, can hardly proceed from the office which, the promoters hope, will win the competition, and which is situated in the next street but one. And if a clerk from that office arrives with a packing-case on a cab, and if the secretary or the caretaker happens to recognise him, how can an accident like this be avoided? You cannot make it a rule that everyone who delivers a set of competition plans must wear a crape mask, like a highwayman. And if you could, there still remain a thousand other ways in which the committee, even if they desired to avoid it, would learn which designs are by their personal friends and acquaintances. Here, then, we have a third source of failure in competitions—a third reason why it is becoming less and less common for the best man to win. The pretence of secrecy has grown into a cover for injustice. The system that was to secure fair play for everybody has proved, in too many cases, a mere hotbed of jobbery and favouritism.

More than ten years have passed since a very large number of architects signed an undertaking not to join in any public competition unless one or more professional assessors of established reputation were appointed to advise the promoters on the relative merits of the designs. It was a promising and well-intended step; but what have been its results? The chief one has been to show that everything now depends on the choice of an assessor; and that satisfactory assessors are wonderfully rare. We have had one, to whose wide knowledge, openness of mind, and determination to secure satisfactory results the country will owe some of its most successful buildings. We have had others, and many of them, to whom it will be indebted for a great deal more that is commonplace and bad. Their selections have often been no better artistically than the selection which a committee would make for itself; while in matters of arrangement and convenience they have been far inferior to it. "Established reputation": how are a lay committee to judge of it? To them, the hereditary practitioner, and the party-hack, are men of established reputation; the local surveyor—good enough in his own province, but not in the province of architecture—is a man of established reputation; the man who put up the last large building in the nearest large town is a man of established reputation; so is any professional friend of the chairman, or of the secretary, or of the chief members of the committee. For one committeeman to object to the intimate acquaintance of another, on the ground that he was not an architect of established reputation, would be almost a *casus belli*. Thus it happens, in a multitude of competitions, that the assessor is one who has scarcely been heard of by the profession in general, or one in whose judgment there is a plentiful lack of confidence. This lack of confidence is too often justified by the result.

Objectionable assessors are of many kinds. Lately, if we may judge from results, the squeezable assessor has often come to the front. The "influential man" of the committee—for every committee has one "influential man," and if peace is to be preserved, not more than one—walks with him round the room where the drawings are on view. "We consider," says this great personage, as they stop before as undistinguished a set of plans as any in the room, "that this is one of the most satisfactory schemes submitted. We are nearly all in favour of it, though there is a small minority who prefer another design, which I shall point out to you presently. I earnestly hope that your judgment may coincide with ours; but if you should feel compelled to prefer the other set of plans, of course we should bow to your opinion, and give it a premium, though I think I may say that, in any case, the one you are now looking at is the one we shall build." If the assessor is pliable or putty-like, this settles the matter. He decides as he is directed, and outsiders marvel at his judgment. He gets his fee with little trouble, and if he is bought, the competitors are sold. Then there is the assessor who knows nothing about the particular class of building he is dealing with; it is the "practical man" of the committee who takes him in hand and leads him. If there is no practical man, he judges by such light as he has, which is probably very little. He mentally compares all the designs with the two or three buildings of the same kind which he remembers best, and gives his award in favour of that which follows their lines most closely. We can all see how much hope there is for an original thinker when the fate of his work rests with a helpless being of this sort, and yet such helpless beings have, before now, settled the destinies of many hundreds, perhaps many thousands, of designs. Then there is the up-to-date assessor, who is only fit to pick out the last new thing in styles, and who can assure the promoters that "this is how we are making them now." The old fogey assessor is the converse of him: he will go back for half a century, and give the first prize to somebody who has learnt nothing and forgotten nothing since the age of Pugin and Barry. Then there is the draughtsman-assessor—a much commoner type than people fancy—with whom plan and arrangement and composition all go for nothing, unless they are set forth by beautifully-ruled lines and admirably-turned circles. There is the self-seeking assessor, watchful beyond everything that his award shall not give some rival a lift; and the bravo-assessor, who uses his report to stab behind the arras of a motto some fellow-architect whom he dislikes, thinking that he can neither ward off the blow nor strike back in return. The competing architect has to take his chance of being at the mercy of such assessors as these. Some of them may be men of "established reputation," but a reputation in one branch of the profession does not qualify a man to be an assessor in another branch. Most of them are not so in any sense; but committees believe them to be, and who is to disabuse them of the belief? This indefinite phrase, "established reputation," is the very rock on which the great competition reform we all hoped for has struck and gone to pieces. The results have been successful where assessors have been of the class which these vague words were really meant to indicate; they have been disappointing, or utterly bad, where they have been of other classes. And the net result is that the fourth and perhaps most conspicuous cause of failures in competitions is at present the unwise choice that is often made of an assessor. It is harder, if anything, to select an assessor than to select a design. How can we expect committees to do the one when they could not do the other?

Minor causes of failure are plentiful, but these four are unmistakable. We must leave for another article such suggestions as present themselves for removing, or at any rate for lessening, them.

SHOULD THE ARCHITECT SUPPLY DETAILS?

DETAILS enter so largely into the spirit and merit of a building, that we cannot conceive a design perfect without them. During the best periods of architecture, they were considered as necessary to the integrity and perfection of a building as the general design, and we have ample proof of this in refinements of outlines and mouldings of Greek temples, and those of the best period of Gothic. No doubt during the Early Renaissance the details were less carefully studied, as they were mostly taken from Classic work and grafted on the Gothic forms which were then in use. Renaissance work, both on the Continent, and in England, show that the details of moulding and ornament retained very much of the Classic character, especially in many of the earlier examples. Thus the mullion and transom window, so common in the time of Elizabeth and James, was practically a Late or Domestic Tudor feature. The gable also was retained, though made more ornamental by devices and fragmentary portions of pediments, and it is quite possible, therefore, that the designers of many of the fine old houses of those reigns were contented to copy the details of windows and mouldings, or to leave them to the taste of the master-workmen and masons. We have corroborative proof of the repetition of details in examining the buildings of this period in every locality, where we shall find the same stone or brick mouldings in perhaps half-a-dozen old houses, similar gables, and windows and mullions, and a general resemblance in the woodwork details of wainscoting and framing. Whether, therefore, we have any right to conclude, as Mr. J. Alfred Gotch, F.S.A., has done in his able work on the "English Renaissance," that, because John Thorpe and his contemporaries have not left us working details of their designs—these being absent from his collection—therefore the inference is that the master-workmen supplied their own details is open to doubt. It is more probable, to our minds, that the details were copied or adapted from existing buildings, these being in most instances specified by the architect or surveyor. The critical remarks by Mr. Phené Spiers and Mr. Wyatt Papworth on Mr. Gotch's work possess interest to the modern architect at this moment, when the question of the position of architect in old buildings has not yet been satisfactorily cleared up. Was he, indeed, as Mr. Gotch infers, an ordinary surveyor and the designer of shells of houses, who left all the designing and embellishment to the master workmen, as Thorpe is said to have done; or an architect who carried out the design and details as the modern practitioner does now? As Thorpe is regarded by the author as the "type of the architect and surveyor of his day," it follows that he is taken as a representative of the practice of architects, or so-called "surveyors," of that period. Thorpe was unquestionably a surveyor, as Mr. Papworth asserts, and his collection of drawings — probably those measured for the proprietors' records—were drawn to a small scale. Interspersed with these surveys were found copies of designs made by other hands, it is supposed, and which Thorpe in some cases altered. Whether he was a copyist only, or a designer of houses, we need not inquire here; certain it is that he carried out few, if any, of the buildings attributed to him. Mr. Gotch argues that his drawings or sketches were made for houses; that he prepared plans and elevations which were handed over to local master-workmen to carry out. Some of these were rough. He says: "In no place that I yet know of is there anything to suggest that there was a person who supplied all the drawings in the way in which architects supply them nowadays, or to suggest that there was one controlling designer." Many old building contracts and accounts of work are cited to show there is nothing in them to indicate the existence of a general designer. With reference to the erection of Burghley House or Hatfield House, there is no reliable evidence to prove that an architect was employed as he would be now. From what we know, and from accounts of work and items of this period, we are forced to the conclusion that the master-workmen were responsible for much of the detail which now falls to the lot of the architect, and it was very probable, as we have suggested, that the surveyor gave the general plan and drawings, and that the working masons and carpenters carried out the details according to some old example as they were directed. From the evidence we have of the old workman and the excellence of his craftsmanship, it is obvious that he possessed considerable artistic training in his own branch; while it is equally certain the master-workman had a general knowledge of building, and set out the details and made the drawings that were required. They were well acquainted also with the best examples, and took a personal interest in studying the details of building, and were in these respects very different from the modern tradesmen and average foremen. Old documents, building accounts, and agreements speak of "surveyor" or "surveyour," of master-mason, of carpenters and plasterers, and other trades, but not of architect. In several instances mention is made in old accounts and entries of plasterer's work, in which he supplies "modells" or "paternes" of the ornamental work, which certainly indicates the custom in vogue of copying suitable details, or rather of adapting old forms.

Whichever conclusion we adopt, it is very clear that the old workman had far more to do with the details of the buildings than his modern successor. The question naturally occurs, What would be the effect on our modern architecture if the workman had a similar share in its production? Would it be safe to allow every tradesman to design the details of our buildings, or the architect to hand over to him the detail of any particular trade? From what we know of the average workman, his artistic discernment is not keen. Even improved technical training and mechanical agencies have not made him perceptive; indeed, they have rather taught him to rely too much on others, and too little on himself, and to regard himself as a machine. He has been taught to copy drawings, to obey the orders of those for whom he works, of the foreman or builder. We should be almost afraid to let loose on a building a number of carpenters and plasterers to do as they pleased. Details would be awfully "mixed up" in matters of style. Gothic mouldings and methods would probably be used in buildings where all else was Classic, and *vice versâ*. But even under our present system these things need not be so. If workmen were brought into contact with architects in studio and workshop, we might still have a trained body of men equal to the best traditions of art, whom the architect would engage in his works. We look forward to a time when technical instruction will be directed by masters who can give an artistic direction to manual skill, when the workman will be able to express himself in drawing out details and possess an interest in his own trade.

The method by which the architect now furnishes details for a building is different to the old plan. The working drawings and small scale details are now furnished for contract purposes, and are usually made before the quantities are taken out, and are consequently more or less hurried; but when the trades were invited to do their respective parts by the "piece" or by the day, there was no hurry—each workman had time to make his own details, and to arrange with other trades how a certain part, like a window, had to be finished. In these days, between the architect and his clerk of works, it is often a trouble to get a working detail soon enough, and when the contractor gets it, he perhaps grumbles at the amount of labour involved, and tries by sundry devices to pick holes and alter it. Perhaps the workman is called into the secret councils of his employer to do what he can with less cost of material and labour. The depth of a moulded joint or mullion is reduced; it is "boxed" or built up of thinner pieces of stone; architraves and cornices are similarly treated. Instead of a solid wood moulding, it is made up of small scantlings. In these circumstances the workman loses all interest in his work.

The system of drawing up bills of quantities and measuring artificers' work has done much to place details in the hands of the contractor. As the main object is to reduce material and labour, the quantity surveyor practically takes the detail out of the architect's hands. An appeal to the quantities is made in every case. In the progress of a large building, a great deal of this kind of work devolves upon the clerk of works, who often makes a full-size drawing of the detail or sets it out himself, having all the requisite data at his disposal. He, in fact, occupies much the same position as the master-workman of old days, and were it not for his presence on the works, a large building would fare badly. The great difference between the two systems resides in the fact that, in the old régime, the working details were made on the spot; in the modern, that they are prepared in the office. Architecture has lost a great deal of its local character and charm by this modern process. A work by a London architect in Yorkshire, Northamptonshire, or Somersetshire retains a good deal of Londonism in character and detail, though local workmen may be engaged. From the London office every detail comes, and there is naturally a good deal of sameness in the work. Formerly local designers and workmen were employed; there may have been only a few architects or surveyors like John Thorpe, but the workmen who did the details were generally local men who knew the peculiarities of the materials and workmanship of the district. In this way they gave us halls and mansions like Wollaton, Kirby, Burghley, or Hatfield, examples of individual strength and local interest. The emanation of the whole design and its details from a London office hundreds of miles away must necessarily impart a oneness or sameness to the building, which we can hardly fail to perceive in many of the recent structures for municipal and other purposes erected in distant counties, from the designs of London architects. The office-made details have a stamp of their own, which cannot be mistaken: we lose the natural sympathy and correspondence between the local stone and its type of ornament and moulding; local architectural types are absent, and often a constrained and forced effect is apparent in the features and details of the design. Then we have the obvious loss of sympathy which prevailed when the workman made his own details. How can the draughtsman confined from year to year in an office, who knows little of the actual exigencies or of workshops or buildings, feel any particular interest for a work he has never seen? These, among other reasons, can be brought forward to prove the weakness of the modern system. No doubt it may be urged, on the other side, that the architect is the right person to design the details, and to bring them all into harmony with each other.

* * *

THEATRES.—XXXVIII.

By Ernest A. E. Woodrow, A.R.I.B.A.

The fittings and fixtures in a theatre call for special notice, for if they are injudiciously chosen or badly placed, they may destroy much of the care that has been taken in planning the house, with a view to public safety. Such, for instance, would be the case if the seating of the auditorium were not arranged, and the gangways placed, with due regard to the position of the exit doors. The exact position of each seat, and the precise number of them, must be definitely decided upon when drawing the plans. The theatre manager will require to know how many seats, from which a good view of the performance can be obtained, his house will contain, and which will be saleable seats, before he can calculate upon the estimated nightly returns, and whether or no his enterprise will leave a margin of probable profit. The authorities, also, will require an exact plan of the number and position of each chair or bench. The architect will be well advised to work out his seating plan to a large scale before commencing the building, so as to be certain of the position of each seat to an inch.

There is another reason for this demand for accuracy. Where the seats have to be fixed (as all theatre seats must be) to concrete floors, some method of securing them has to be provided, by inserting lengths of wooden fillets in the floors, or by plugging the floors for each screw. Where the exact position of each row is previously determined, fillets can be laid in the concrete floor as the work proceeds, thus saving much cutting away and making good, economising time and money.

The rule of the London County Council on this point reads as follows:

"Such drawings shall also show the respective numbers of persons to be accommodated in the various parts of such premises, and the area to be assigned to each person, which shall not be less than 1ft. 8in. by 1ft. 6in. in the gallery, and not less than 2ft. 4in. by 1ft. 8in. in other parts of such premises."

Mr. Buckle, in his work on Theatre Construction, gives the following notes as the result of much study and observation with regard to the space required for seating in various parts of the theatre. The pit seats, which are generally continuous, he says, need not exceed 9in. or 10in. in width when without backs, and 12in. or 13in. when with backs; when the seats are divided, 18in. are allowed for each person; with an inclination of the floor of half an inch to the foot, the height of the seat may vary with advantage from 15in. in the front rows to 17in. in the middle, and 19in. at the back. The distance from back to back of pit seats is given by Mr. Buckle as 2ft. 2in. when without backs, and 2ft. 4in. when with backs. Speaking of other seats, the same authority advises, for the stalls, 20in. to 24in. in width and 3ft. from back to back; for the dress circle, a similar size, but slightly higher in the seat; for the upper circle, 1ft. 6in. for each person, and 2ft. 6in. from back to back; for the gallery continuous seats, 2ft. 3in. from back to back.

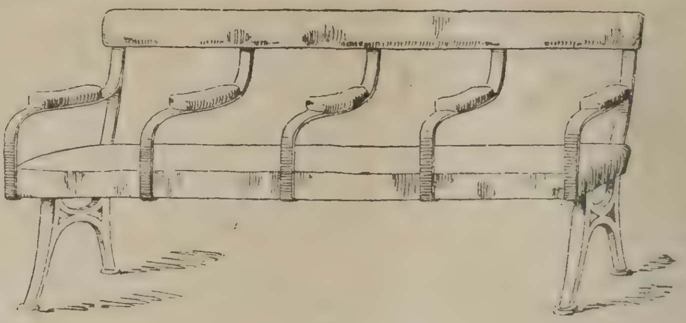

Fig. 1.

It is advisable for the comfort of the audience that the seats should be divided off from each other by arms and should also have backs. This is not, however, always acceptable to the manager in the cheaper parts of the house—as the gallery and pit—for it is found that where there are no arms people will "pack" closer than the regulation 1ft. 6in. Where there are no backs to the seats, intermediate gangways are not introduced, but only the 3ft. gangway all round the seating required by the rules of the authorities, as the people can then step from seat to seat, but where backs are used intermediate or central gangways are frequently required, as well as the side gangways leading to the exits. This means loss of floor-space for seats to the management and a nightly loss on the takings.

There is, however, another point of view to look at this question from, and one that has been accepted by many managers as the wiser policy. Make your audience as comfortable as you possibly can, do not crowd or crush them in their places; remember they have to occupy them for three or four hours, and if they go away suffering from cramped limbs, they will not be likely to come again, however good the play; give them every comfort and ease, and they will sooner sit in your theatre than in their own armchairs. There is no doubt that, although the house may not hold so much money each night, that, in the long run, this policy is the paying one. The greatest expense that the management has to contend against is a constant changing of the bill, and the immense outlay for new productions; the longer, therefore, a play will last, the greater the profits, even if the house is made to hold some ten or a dozen less people in the cheaper parts. Profits are made at the end of the run of a play, not at the beginning, for out of the first takings the book, scenery, wardrobes, &c., &c., have to be paid for.

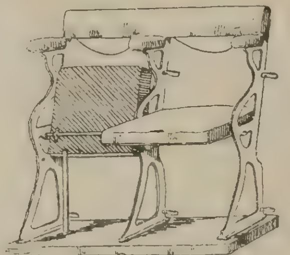

Fig. 2.

In order to illustrate this article I have made sketches from information supplied me by different manufacturers; but, as in dealing with similar cases in these papers, it must be distinctly understood that I do not mention the names of the firms with any idea of stating that they make a better chair or seat than any other firm, but merely give sketches of their work because they illustrate the meaning of my paper. Fig. 1 is a pit-seat, showing how the dividing arms are introduced, so that each person is given an allotted space and overcrowding avoided. This seat is manufactured by Mr. Lazarus, of Curtain-road.

Fig. 2 is the pit-seat of the Garrick Theatre, London, of which I am enabled to give a sketch through the kindness of Mr. John Hare, the noted actor, who, with the aid of the well-known architect, Mr. Walter Emden, designed the seats for the pit audience with special features of comfort. The seat, as the sketch shows, is a tip-up seat; at the side of the seat are two rings for placing an umbrella or stick, and at the back is a cord upon which to hang a coat. I have not been able to find out the maker of this particular chair. It is clearly obvious that anyone wishing to spend half-a-crown upon an entertainment would far rather choose a theatre where such regard for comfort is displayed than go where only the hard wooden form without any back to rest against is provided, as used nearly always to be the case in the pit and gallery of theatres.

The frequenter of the pit is often at a loss how to dispose of his overcoat, hat, and umbrella, without sitting on the one and allowing his neighbours to trample on the others. This seat does away with those annoyances.

We may take it as a rule that all seats should have arms and backs, and it would be a great blessing if theatres had to be licensed like steamboats and omnibuses to contain only such a number as there were authorised and numbered seats in the house; this would be a most beneficial measure for the safety and comfort of the public, and it would entirely do away with overcrowding.

With regard to the "booked" seats in a theatre, the space given varies according to the position and price paid for the tickets, from the minimum allowed by the authorities to almost any width in the stalls that the luxury and the comfort of space between the arms demand; the same remarks apply equally as to the space from back to back. This, however, as a rule, is far too narrow, either for the comfort of sitting or for passing in and out in front of those already seated. Most of my readers will have experienced the discomfort in the circles of a theatre of jamming his knees into the back of the seats in front, or when the steppings are low of irritating the occupant of the seat in front by inadvertently jogging him in the back; to avoid this it is necessary to sit sideways in one's seat and twist one's neck to see the stage.

Fig. 3 is an ingenious contrivance which the Bennet Furnishing Company, of Glasgow, have arranged in order to give as full a width of space for walking down between the rows as possible. When the seat is unoccupied and closed-up, the back is perpendicular, but when the seat is pulled down and occupied the back is tilted, as shown

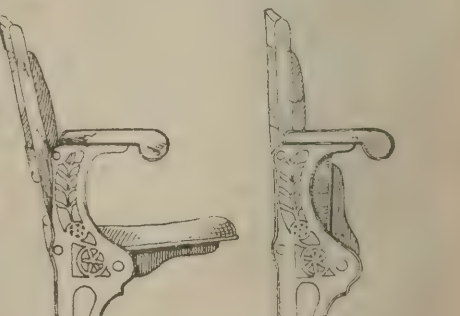

Fig. 3.

in the sketch. Should any one be passing behind, the inclination of the sitter is to lean slightly forward, and it is claimed that the back of this stall follows, and thus those in the rear have the extra space of 5in. given them for ingress and egress. The makers of this chair claim that 2in. more of passage space between the rows can be obtained by their chair when set out at 2ft. 3in. distances, than when the ordinary chair with fixed backs are set out at 2ft. 6in. from back to back. They also state that the advantage of economising space is so great that another row in every nine can be added, still allowing the sitters the same amount of room and comfort as would be obtained in a chair with a fixed back. I should state that I have not seen this chair in use.

Tip-up seats are preferable where saving of room is required, and Fig. 4 gives a sketch of an ordinary tip-up chair in iron frame and standard, as made by Mr. Lazarus.

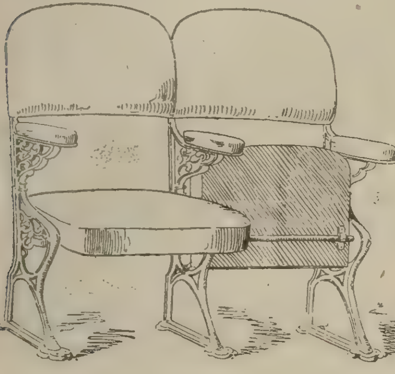

Fig. 4.

There are, however, some managers who consider that the space required for passage between the rows should not be acquired by tipping up the seats but by a more liberal spacing of the chairs, making them 3ft. or 3ft. 2in. between the rows; they also state that where half a guinea is charged for a seat, that seat should be as comfortable as any in the drawing-room which is left for the time for the theatre stall. No doubt in certain centres these arguments have been found to be the right ones, but in these papers we have to consider unfashionable as well as fashionable houses. Messrs. Gregory, of Regent-street, through the very kind offices of Mr. John Hare, have given me a sketch, Fig. 5, of the stall arm-chair at the Garrick Theatre. This chair is set out at 22in. centres, and 3ft. from back to back. It was adopted after the making of several models, including one of a circular-backed and stuffed arm-chair, made after the pattern of an old writing chair. Under the chair, as the sketch shows, is a ledge or box for the placing of a hat, and on the back of the chair is a pocket in which those occupying the row behind may put their programme. A well-known inconvenience with rising-flap seats is that people are not always sufficiently careful to see that the seat is placed down ready for them to occupy, and the result is somewhat unexpected and undignified. An architect some few years ago suggested that the arms as well as the seat should be made to lift up, and that they should rise together with one action, and he pointed out that this would also overcome the inconvenience of stooping down and holding the seat while in the act of sitting, as the seat could be lowered by pressing down the arm. In my next number I have further to consider this all-important question, and will introduce some sketches of patent folding theatre chairs.

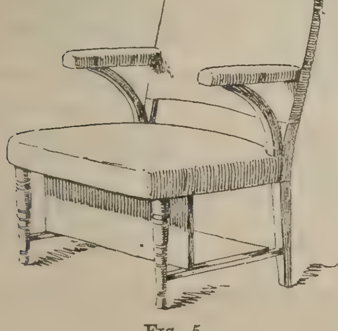

Fig. 5.

◆

THE SOCIETY OF ARCHITECTS.

THE last meeting of the Society of Architects for the present session was held on Tuesday last at St. James's Hall, the chair being occupied by Mr. G. Highton, F.R.I.B.A., the President. A considerable list of donations to the library having been announced, the following were duly elected as members:—Henry Etherington, 12, Doddington Grove, Kennington, S.E.; William G. Ingram, City Bank Chambers, 44, Theobald's-road, W.C.; Henry Lovegrove, A.R.I.B.A., F.S.I., 314, Old-street, E.C.; William J. W. Roome, 63, Clarendon-road, W.; and William Herbert Scott, Midland Chambers, Walsall.

A chatty lecture was then delivered by Mr. G. A. T. Middleton upon the Architecture of the Rhine Valley, he explaining that he had been asked not to write a formal paper, but rather to give an illustrated description of the route followed during a sketching tour last April. The new route to the Continent *viâ* the Hook of Holland being utilised, with its fine night service from Harwich, Cologne was reached on a Saturday afternoon, and several days spent there in sketching the huge Gothic cathedral, the Rathhaus, with its Late Gothic tower and its Renaissance porch, and the great Romanesque churches for which the town is, to the architect, perhaps more famous than anything else, the churches of Sta. Maria, St. Martin, St. Gereon and the Apostles, all magnificent examples of Romanesque art, and, though recently restored, not spoilt by the restoration. This, unfortunately, cannot be said of some of the other churches of the same date in the Rhine Valley. The great church at Andernach is now hard and cold; while that at Boppard is utterly spoilt, past all remedy, as completely as is St. Alban's Abbey. Boppard, however, is a pretty little town, and is rendered archæologically interesting by its Roman gate. From there to Bingen the route is through the famous Rhine gorge, with mediæval castles, now in ruins, at every few miles distance on either bank, and with little towns sheltering beneath their protection, each with its walls and bastions more or less intact. At Mayence the cathedral and the Roman aqueduct are the only erections which time will allow of being visited. The cathedral has both eastern and western apses, and is Restored Romanesque—magnificent in general grouping, but crowded round with shops and houses. Canon Schneider has found here a fine collection of wood-carving of all dates, and also takes great pride in showing the mural effigies of the various bishops, each a good illustration, with its canopy, of the German work of the period when it was erected. Worms Cathedral was the last of the Rhine churches seen, and that is just about to be practically rebuilt, and none too soon, the cracks in the masonry, both of the western apse and the south transept, being of such proportions as to call aloud for immediate attention. Work has already commenced, and in opening up the foundations of an earlier western apse have been discovered, semicircular in form, within the existing one. Branching off from the Rhine, the castle of Heidelberg was described—that renowned Renaissance structure, than which few more beautiful exist, the wealth of carving being still in almost perfect preservation, even upon the shell of the great portion which was destroyed by fire. From Heidelberg to Würzburg the route lay along the Neckar Valley, more beautiful, though less known, than that of the Rhine, and then across the watershed between the Neckar and the Main. Würzburg, however, is a disappointing place, with little except the Rathhaus tower, which is worth a sketch; but it is quite a different thing with Nuremberg. There, within the almost perfect walls, everything is old and quaint and beautiful. It is a mediæval town, in fact, with scarce a modern building in it, and these fortunately carried out in a spirit which harmonises with the old. It is a place for months of study, but hardly the right spot for an unfledged student to go to. Much, though picturesque to the extreme, is impure in style. The spirit is all that can be desired, but study there must be cautiously entered on.

A vote of thanks was proposed by Mr. S. W. Kershaw, F.S.A., who drew special attention to the Stations of the Cross by Kraft at Nuremberg. It was seconded by Mr. Lawrence Hooper, A.R.I.B.A.—who spoke of the monuments to the great men of the country, and to the fountains, great features of German work, successful exactly where the English generally fail—and supported by Mr. Henry Lovegrove.

◆

THE ARCHÆOLOGICAL CONGRESS.

THE Sixth Congress of representatives of archæological societies was opened on Monday afternoon, in the meeting room of the Society of Antiquaries, Burlington House. Sir Wollaston Frank presided. On the motion of Mr. Nevill, it was resolved to continue the printing of the lists of those parishes where a transcription of the registers in existence had been made. The question of a photographic survey of England by counties was brought forward in the report of a committee, read by Mr. Nevill. Dr. Cox read a paper on "Popular Archæological Errors and Fictions." He suggested that a glossary of popular archæological errors should be prepared, and proceeded to deal with errors in ecclesiology. The first was, that cross-legged effigies were not certain proofs that those they represented were Crusaders. In proof of this, he stated that many well-known Crusaders were not represented as cross-legged, that the effigies of some ladies were cross-legged, and that the habit of crossing the legs was common long after the Crusades had terminated. Leper windows were not openings through which a leper could see the sacred elements or communicate. Whitewash on stones was not an abomination of the Reformation, but was commonly used long before that period. The cleaning and stripping of all colour from oak was an ignorant blunder, and one which had resulted in charming work being almost completely spoiled. The application of the terms "Pastoral staff" to a bishop's crook, and "crosier" to an archbishop's cross were, he contended, errors, and many other popular blunders were pointed out. At Shaw House, Newbury, there was preserved a Mother Shipton hat, which was always described as the headgear of Oliver Cromwell. Other fictions were also referred to—such as the elopement of Dorothy Vernon from Haddon Hall, and he insisted that, in the cause of truth, all such fictions and errors should be exposed. The chairman said that it was a fiction that the British Museum was in want of a Queen Anne farthing, and that, although they had two, they were ready to pay anything to get the third, whereas there were five varieties issued, and one only was very rare. Many brass counters of Queen Anne's reign were offered to the Museum as Queen Anne farthings. Applications were constantly made at the Museum to see the stone brought from Wales which once marked the spot where St. Paul preached (laughter). The arrow, also, with which St. Edmund was shot was constantly turning up. Mr. St. John Hope referred to the legend that all underground passages connected with old castles or houses led long distances underground, and were used for walking along or escaping; whereas, in his opinion, they were most likely used for drainage purposes. Mr. Nevill referred to the legend that an underground passage formerly ran from Dover to Canterbury. Mr. Wildridge, of Beverley, spoke of the discoveries of valuable tracings of frescoes which had followed the removal of ancient whitewash from walls and pillars of churches.

◆

The memorial it is proposed to erect on the north side of the chancel of St. Augustine's church, in memory of the late Rev. Prebendary Gordon Calthrop, M.A., will probably be ready for erection the latter end of the coming month. It has been designed in harmony with the architectural surroundings, which are of 14th century, or Decorated Gothic character, by Mr. J. Douglas Mathews, F.R.I.B.A. The drawings suggest a tablet of veined and polished warm-coloured alabaster, measuring some 7ft. high by 5ft. wide. Flank buttresses on either side support the superstructure generally. These buttresses are panelled and traceried on their front surfaces and terminate in crocketed pinnacles. The central head is of ogee outline enriched by crockets and terminating with a boldly-outline finial. The whole of the base will be most ornately carved, and in the centre will occur the arms, motto, and crest of the deceased cleric, carved and decorated by heraldic colour. Messrs. Harry Hems and Sons, of Exeter, are the sculptors.

BRITISH BUILDING STONES.—IX.

IRELAND (*continued*).

No.	Quarry.	County.	Geological Formation.	Description.	Colour.	Weight of a Cube Foot.		Water Absorbed per Cube Foot.	No. of Cube Feet to 1 ton.		Remarks. Where used, analysis, crushing strain in tons per ft. super., cost per cube foot.
						Dry.	Wet.		Dry.	Wet.	
						lb. oz.	lb. oz.	Pints.	ft. in.	ft. in.	
273	Carrickmacroly.. Carndonagh (7).	Donegal.	Metamorphic beds. *Lower Silurian.*	Quartz rock, finely granular.	Greenish grey.	180 1	180 7½	¼	12 5	12 5	Crushes with 720 tons on bed, 1,400 tons on edge. Works well.
274	*Carrigmore	Cork.	Limestone. *Carboniferous.*	Crystalline compact limestone.	Light grey.	168 10½	168 14¾	1.6	13 3¼	13 3	St. Finn Barr's New Cathedral, Cork.
275	Cave Hill ... Belfast.	Antrim.	Chalk. *Cretaceous.*	Compact indurated, altered by heat	Cream.	161 11¾	164 13¼	2⅜	13 10¼	13 7	An average of two specimens gave 920 tons as the crushing weight.
276	Cloghrenan.. Carlow (2).	Queen's County.	Millstone grit. *Carboniferous.*	Fine-grained sandstone.	Dark greenish grey.	163 3¼	164 9	1⅛	13 8½	13 7¼	Used for walling in Cloghrenan Castle, with brick dressings, and for tombstones, and burnt for lime!
277	*Clonaslee... (seven miles from a railway station).	Queen's County.	Old Red sandstone. *Devonian.*	Fine-grained sandstone, bedding not obvious.	Light grey.	155 4½	158 2	2¼	14 5	14 2	Proprietor says, "Up to 14 or 15 years ago we carried on an extensive business in these quarries, since which time they are virtually idle." Stone-cutters and quarrymen emigrated for want of employment. Used in Mountmellick and Templetouhy R.C. Churches; Killeigh Church; Hollow Chapel, Mountrath; steps, &c., in the restoration of St. Patrick's Cathedral, Dublin, 1862. The stone was supplied to Lords Digby, Portarlington, Listowel, De Vesci, Ormond, Charleville, Ashbrook, &c. Stones can be obtained from 16ft. to 20ft. long, 10ft. to 14ft. wide, and from 1in. to 6ft. thick.
278	Clonmel ..... (Quarry ½m. from town).	Tipperary	Old Red sandstone. *Devonian.*	An aggregate of quartz grains.	Greenish white.	126 6	135 2½	7	17 8½	16 6¾	West Gate, Clonmel. Easily worked, about 8ft. of plain work per day. Crushes with 213¾ tons, average of two samples, on bed and edge. The Clonmel Workhouse is built with limestone quarried on the site. The river Suir, which flows through Clonmel, divides the limestone district from the old red sandstone, the former being on the north side of the river, and the latter on the south side.
279	Cookstown ... Cong Quarry (¾).	Antrim.	Calciferous sandstone. *Carboniferous.*	Micaceous sandstone, with ochreous spots..	Yellowish Cream.	142 8¾	151 6½	7	15 8½	14 9½	A stone, 3in. by 3in., with a 12in. bearing, broke with a little less than half ton in the centre.
280	Cong	Mayo.	Limestone. *Carboniferous.*	Semi-compact crystalline.	Dark Grey.	174 14½	174 14½	0	12 9½	12 9½	Bridges, canal works, churches, and other buildings in the locality. This district is remarkable for its underground rivers, which flow through huge caverns in the limestone rocks. The stone crushes with 711 tons.
281	Cork .... Brickfields (½)	Cork	Old red sandstone, *Devonian.*	Fine-grained, laminated, calcareous sandstone.	Deep red.	168 13¼	168 15½	⅛	13 3	13 3	A stone, 3in. by 3in., with a 12in. bearing, broke with 2 tons in the centre.
282	Cortubber ... Kingscourt.	Meath ...	Yoredale beds. *Carboniferous.*	Fine-grained sandstone, micaceous.	Greyish white.	147 9¾	151 8½	3⅛	15 2¾	15 1½	Crushes with 819 tons.
283	Creeve .... Granard (9)	Longford.	Limestone. *Carboniferous.*	Semi-crystalline.	Light grey.	170 1¼	170 1¼	0	13 2	13 2	Baron Lefroy's house, Carrickglass. Used extensively in Longford town. A good building stone. Beds 3in. to 3ft. thick. Crushes with 1,003 tons. Stones, 10ft. long by 5ft. or 6ft. wide, can be obtained.
284	Crossdoney... Cavan.	Cavan......	Granite.	Fine, syenitic, quartzose.	Bluish grey.	173 9½	173 15½	¼	12 10¾	12 10½	A stone, 3in. by 3in., with a 12in. bearing, broke with 1ton 11cwt. 1qr. 14lb. in centre.
285	Crossdrum ... Oldcastle.	Meath ...	Limestone. *Carboniferous.*	A very pure, highly-crystalline limestone.	Ash grey.	168 10	169 0½	¼	13 3¼	13 3½	Works smoothly; 6ft. chiselled, 8ft. punched, work per day. Crushes with 1,008 tons.
286	Crossrea ...... Granard (10)	Longford.	Limestone. *Carboniferous.*	Coarse and highly fossiliferous.	Dark grey.	173 6¼	173 6¼	0	12 11	12 11	A stone, 3in. by 3in., with a 12in. bearing, broke with 1ton 11cwt. 1qr. 1lb.
287	Dalystown ... Granard (1½)	Longford.	Calciferous sandstone. *Carboniferous.*	Silicious grit, with carbonaceous and ferruginous matter.	Steel grey.	170 9½	170 15½	¼	13 1½	13 1¼	A stone, 3in. by 3in., with a 12in. bearing, broke with 2tons 3cwt. 3qr. across the bed. Crushes with 730 tons.
288	Dernasill ... Augher (3)	Tyrone ...	Calciferous sandstone. *Carboniferous.*	Granular, silicious, highly micaceous.	Greyish white.	143 6	—	—	15 7½	—	Crushes with 468 to 742 tons.
289	Donegal ...... Town Quarry	Donegal ..	Calciferous sandstone. *Carboniferous.*	Earthy compact, slightly calcarious.	Black.	169 9	170 2¼	½	13 2½	13 2	A piece of stone, 3in. by 3in., with a 12in. bearing, broke with 1ton 16cwt. in centre.
290	*Doonagore.. Doolin.	Clare	Millstone grit. *Carboniferous.*	Very fine, compact, minutely crystalline sandstone mica in beds. A beddy stone.	Light bluish-grey.	164 4¼	165 8¾	1	13 4	13 3½	This quarry is at present extensively worked for flagging, curbing, &c. The quarry-owners have a depot in Dublin, where the stone is stocked, and skilled flaggers are engaged for squaring and laying the stone.
291	Drumbane ... Thurles (12)	Tipperary	Old red sandstone. *Devonian.*	Quartz grains in an argillo-silicious matrix. Slightly micaceous.	Light grey.	159 7	162 4½	2¼	14 0½	13 9½	New Courthouse, Nenagh, and buildings in Tipperary. A good-face working stone. Carries 661 tons.
292	Drumkeelan.	Donegal ..	Calciferous sandstone. *Carboniferous.*	Fine quartz grains in a slightly calcareous cement. Traces of mica.	Greenish cream.	146 9	150 5½	3	15 3¼	14 10½	This stone cost from 6½d. to 9d. per foot super, worked 50 years ago. Breaks with 1ton 9cwt. on a piece 3in. by 3in. Supports 12in. apart.
293	Dundiven...... Fintona (2).	Tyrone ...	Old Red sandstone. *Devonian.*	Aigillaceous, felspathic and calcareous.	Greyish white.	150 11¼	155 0	3½	14 10¼	14 5½	Fintena R.C. chapel. Greenish grey bed. Crushes with 729 tons; another fine-grained cream-coloured bed with 463 tons.
294	Dungiven...... (Altmorer Quarry.)	Londonderry.	Old Red sandstone. *Devonian.*	Semi-crystalline, with argillo-silicious cement.	Greenish grey, with brown tinge.	135 13½	143 11	6¼	16 5¾	15 6¾	Court House, Londonderry.
295	Farm Quarry, Westport.	Mayo	Metamorphic. *Silurian.*	Dense grit, silicious.	Greyish blue.	174 8¾	176 1½	1¼	12 10	12 8½	Court House and private houses in Westport. Bed of stone from 1ft. 6in. to 2ft. thick. This limestone "is traversed by numerous very fine cleavages, nearly vertical, and independent of the ordinary joints."
296	Fermoy.........	Cork	Limestone. *Carboniferous*	Compact, crystalline, unequal texture.	Light-blue grey.	171 2¼	171 9	⅜	13 1	13 0½	New barracks, Fermoy. This stone is like the Ballin-temple limestone. Crushes with 787 tons to the foot.
297	Finglas	Dublin ...	Limestone. *Carboniferous.*	(1) Compact, fine-grained, slightly crystalline.	Dark grey.	172 15	173 3¼	⅜	12 11½	12 11	Crushes with 1,215 tons.
				(2) Earthy "calp."	Brown grey.						"Calp" is a bad weather stone. May be seen in many rubble walls in the suburbs of Dublin in an advanced state of decay.
298	Glanmire-road, Cork (1).	Cork	Old Red sandstone. *Devonian.*	Fine-grained, beddy, calcareous sandstone.	Deep red.	167 5	167 5	0	13 2¾	13 2¾	This stone is chiefly used for rubble walling. It is a kind of slaty indurated marl.
299	Glack .... Longford (½).	Longford	Old Red sandstone. *Devonian.*	Coarse white quartz grains, imbedded in a yellowish argillo-calcareous cement.	Cream.	140 15¾	146 6½	4⅜	15 11½	15 3½	Used extensively in the town of Longford. Weathers white; soft when quarried, but hardens on exposure. Beds 2 to 4ft.
300	Glanmore ...	Wicklow .	*Lower Cambrian.*	Close, compact slate.	Greyish purple.	170 9½	170 9½	0	13 1½	13 1½	Crushes with 1,384 tons on bed, and 751 tons on edge. A kind of slate. A piece of stone 3in. by 3in. on a 12in. bearing, broke with 4tons 8cwt. in the centre.
301	Glencull ..... Aughnacloy (¾).	Tyrone ..	Limestone. *Carboniferous.*	Silicious, with ferruginous stains; mica.	Greyish white.	150 0	160 3½	8⅛	14 11	13 11¾	Crushes with 900 tons on edge, 859 tons on bed.
302	Golden Hill Blessington	Wicklow .	Granite of *Lower Silurian* age.	Coarse quartzose, felspathic.	Grey and slightly discoloured.	161 13¾	164 9½	2⅛	14 5½	13 7¼	Four Courts, Dublin. Crushes with 273 to 193 tons.

No.	Quarry.	County.	Geological Formation.	Description.	Colour.	Weight of a Cube Foot.		Water Absorbed per Cube Foot.	No. of Cube Feet to 1 ton.		REMARKS. Where used, analysis, crushing strain in tons per ft. super., cost per cube foot.
						Dry.	Wet.		Dry.	Wet.	
						lb. oz	lb. oz.	Pints.	ft. in.	ft. in.	
303	GRAIGUE ...... Carlow (1½)	Carlow ...	Limestone. *Carboniferous*	Close, compact, minutely crystalline.	Dark blue grey.	171 7½	171 8¾	1/20	13 0¾	13 0½	Takes a polish like black marble; works well. 6ft. plain work, 3ft. plain mouldings, 1½ft. intricate do. per day. Crushes with 694 tons.
304	GRIBBONS ...... Armagh	Armagh .	Limestone. *Carboniferous.*	Compact, crystalline, with fossils.	Reddish grey.	172 11½	—	—	12 1	—	Was extensively used in Armagh. There is a linestone bed 8ft. deep in this quarry, succeeded by marble beds from 12ft. to 19ft. deep. The specimen examined was from the 19ft. marble bed. Blocks of large size can be obtained.
305	HILL HEAD ... Carndonagh (2)	Donegal.	Calciferous sandstore. *Lower Carboniferous.*	Fine-grained, crystalline, slightly laminated, silicious.	Greyish blue.	168 4¼	168 6¾	⅛	13 3½	13 3½	Crushes with 864 tons.
306	KILLARNEY ...	Kerry.	Millstone grit. *Carboniferous.*	Granular, silicious grit.	Dark grey.	172 10½	172 12¾	⅛	12 11½	12 11½	Used for walling in the locality. A Keuper sandstone from Cheshire was used for dressings at a mansion erected in this locality some years back !
307	KILLEA .... Manorhamilton (5).	Leitrim.	Yoredale beds. *Carboniferous.*	Granular; silicious and micaceous.	Greyish white.	144 1	149 10¼	4½	15 6½	14 11½	Crushes with 614 tons. Beds 4in. and 2in. thick; specimen examined from the 4in. bed. Blocks of large size can be obtained. The stone works freely.
308	KILROE .... Tuam (8).	Galway	Limestone. *Carboniferous.*	Semi-crystalline.	Bluish grey.	172 8½	172 8½	—	12 11½	12 11½	New R.C. Cathedral, Tuam. Many of the stones here were fractured, owing to the beds being worked hollow. The stone works well—6ft. to 9ft. plain work in a day; crushes with 860 tons.
309	* KILTOOM...... Athlone (4½).	Galway.	Limestone. *Carboniferous.*	Highly crystalline; granular.	Bluish grey.	167 4½	167 9¾	¼	13 4¾	13 4½	R.C. Chapel, Athlone, and Bank of Ireland. Limestone suitable for monuments; 1s. per cubic foot up to 6ft., 1s. 6d. up to 10ft., 2s. up to 20ft. Quoins a foot high, 10d.; "blocks or starts" about the same. (Richard Smith's quarry).
310	KINGSTOWN ...	Dublin.	Granite.	Highly crystalline, dense, with muscovite and biotite.	Grey.	171 9	171 13½	⅜	13 0½	13 0¼	Kingstown railway station; crushes with 648 tons. Kiliney granite was used in O'Connell's Monument, Glasnevin, Kingstown Pier, and some was sent to the Thames Embankment. The following analysis of the Fox Rock granite, by Haughton, will give an idea of the general composition of this stone: Silicon oxide 73·00, aluminium oxide 13·64, ferric and ferrous oxides 2·44, calcium oxide 1·84, potassium oxide 4·21, sodium oxide 3·53, magnesium oxide 0·11, water 1·20.
311	KINTALE ...... On Lough Swilly, Rathmullen (1½).	Donegal.	Metamorphic. *Lower Silurian.*	Fine crystalline, micaceous, laminated.	Bluish grey.	159 5¼	159 8½	¼	14 0¾	14 0½	Rathmullen Pier. Crushes with 585 tons.
312	KERLISH ...... Southerstown (11).	Fermangh	Old Red sandstone. *Devonian.*	Semi-conglomeritic quartz grains in felspathic cement.		153 11¾	157 5¼	2⅞	14 7½	14 2¾	Crushes with 621 tons on edge, 562 tons on bed.
313	KNOCKALTON.. Nenagh (2).	Tipperary	Limestone. *Carboniferous.*	Compact, minutely crystalline.	Blackish grey.	171 11	171 13	⅛	13 0½	13 0¼	Crushes with 1,026 tons.
314	*KNOCKADARA Ennis.	Clare.	Limestone. *Carboniferous.*	Crystalline, compact, with bituminous matter.	Light grey.	168 5¾	168 8¼	Light. ⅛	13 3½	13 3½	Lunatic asylum, post office, convent, and college, Ennis; new Franciscan Church, Dublin. The stone has been used to all the principal buildings in Clare. It is sold by the perch of 16½ft. square. (James Glynn's quarry).
					Dark grey.	168 2½	168 5¾	Dark. ⅛	13 3¾	13 3¾	
315	LISBUNNY ...... Nenagh (½).	Tipperary	Limestone. *Carboniferous.*	Earthy, slightly calcareous.	Black.	167 2¾	168 4¼	¾	13 4½	13 3¾	Nenagh Gaol. Easily worked. Crushes with 756 tons.
316	LISTOWEL......	Kerry.	Limestone. *Carboniferous.*	Coarse compact (3ft. bed).	Blackish Grey.	175 9	175 15½	¼	12 9	12 8½	Listowel Bridge. Top beds of quarry used for walling only. 10ft. plain work per day. Crushes with 1,490 tons.
317	LISRYAN ...... Granard (4).	Longford.	Limestone. *Carboniferous.*	Earthy, compact; minute crystalline particles.	Dark grey.	168 12½	169 0½	⅛	13 4	13 3	Crushes with 1,188 tons. A "calpy" stone.
318	LOUGHORNE ... Nenagh (3).	Tipperary	Limestone. *Carboniferous.*	Very compact, full of fragments and veins of crystallised calcium carbonate.	Dark grey.	172 2	172 3¼	1/20	13 0	13 0	Crushes with 1,112 tons.
319	MIDDLETON ...	Cork.	Limestone. *Carboniferous.*	Compact, semi-crystalline, unequal texture.	Dark Grey.	174 9½	175 0	¼	12 9½	12 9½	Crushes with 922 tons.
320	*MILVERTON.. Skerries.	Dublin.	Limestone. *Carboniferous.*	Compact, crystalline; equal texture, splintery.	Bluish Grey.	167 14	168 5¾	½	13 4	13 3½	
321	MOHILL .... Workhouse Quarry.	Leitrim.	Limestone. *Carboniferous.*	Compact, earthy.	Black.	170 11½	170 13½	⅛	13 1½	13 1½	A stone 3in. by 3in., with 12in. bearing between supports, broke with 2tons 7cwt. in centre. Stone for dressed work in Mohill was generally brought from Mealwood Quarry, three miles from Carrick-on-Shannon.
322	MONEEN ...... Castlebar.	Mayo.	Limestone. *Carbonferous.*	Highly crystalline.	Blue grey.	167 9½	167 11½	⅛	13 4½	13 4½	Crushes with 445 tons. Castlebar gaol and barracks built with this stone. Carries a good arris.
					Dark grey.	165 4½	165 4½	—	13 6½	13 6½	Crushes with 792 tons.
323	* MOOR QUARRY. Newry.	Down.	Metamorphic granite.	Quartz, orthoclase biotite, hornblende.	Light grey with black spots.	168 0	168 5¾	¼	13 4	13 3½	A specimen of heavy granite, from Goragh Wood Station, is remarkable for the low percentage of silica it contains. Haughton gives the following analysis: Silicon oxide, 62·08; aluminium oxide, 15·92; iron peroxide, 7·72; calcium oxide, 5·52; magnesium oxide, 2·16; sodium oxide, 3·34; potassium oxide, 2·19. Loss, 0·89.
324	*MOUNT CHARLES.	Donegal.	*Lower Carboniferous.*	Crystalline sandstone, with small quartz pebbles; bedding observable.	Light cold grey.	160 15¼	164 10¼	3	13 11	13 7¼	Sligo Bank for dressings, with facings of chiselled Ballisodare limestone. Science and Art Museum, Dublin; Court House, Sligo; Letterkenny Cathedral; Killygordon church. 1s. 2d. per foot in random blocks delivered into boat at quay. This stone is quarried by the sea coast, and is loaded in vessels of from 60 to 100 tons. A vessel cannot lie at Mount Charles pier in rough weather. It is therefore difficult to get a cargo of stone at certain times. Crushes with 639 tons on bed, 841 tons on edge.
325	MOYNE .... Ballina.	Mayo.	Limestone. *Carboniferous.*	Fine-grained oolite structure.	Dark grey.	169 13½	169 13½	—	13 2¼	13 2¼	Moyne and Roserk abbeys; Killala round tower. 4ft. plain work per day. Crushes with 1,156 tons.
326	MULLAGHGLASS......... Newry (2½)	Down.	Granite.	Coarsely crystalline, white quartz and felspar. Biotite.	Light grey.	171 15½	172 6¼	¼	13 0	13 0	Crushes with 864 tons. (See No. 323.)
327	*MULTIFARNHAM	West Meath.	Limestone. *Carboniferous.*	Compact, slaty texture.	Blackish grey.	163 11½	164 4¾	⅜	13 8	13 7½	Used in Mullingar, Ballinacargy, and various parts of the surrounding country. "Price of stone varies, and depends on a variety of circumstances." It is sold quarried, or not quarried; dressed, or in the rough. A "lucid" description of what may be required will bring a fixed price on application to the proprietor, F. L. Mason.
328	RATHCLINE .. Lanesborough	Longford.	Limestone. *Carboniferous.*	Crystalline and fossiliferous.	Light brownish grey.	175 2	175 3	1/20	12 9½	12 9½	A good working stone, takes a polish. Crushes with 910 tons.
329	RINCLEVEN ... Dunfanaghy.	Donegal.	Metamorphic beds. *Lower Silurian.*	Highly-crystalline limestone.	Creamy white.	172 6¼	172 10½	¼	13 0	13 0	Good for all dressed work, but difficult to work. Crushes with 540 tons.
330	ROSS .... Near Lough Sheelin.	Cavan.	Limestone. *Carboniferous.*	Highly crystalline.	Light dove colour.	170 14½	171 2½	⅛	13 1	13 1	Crushes with 432 tons.
331	ROSSBRIEN ..	Limerick.	Limestone. *Carboniferous.*	Compact and highly crystalline.	Light bluish grey.	165 15½	166 15¾	¾	13 6	13 5	Sample examined has patches of dark slaty-blue colour throughout the mass. The stone is rather hard to work, is quarried in blocks up to about 25c.ft., and costs 1s. per foot for ordinary-sized blocks. The proprietors are Messrs. John Ryan and Sons.
332	SALLYCROSS ... Kanturk (2½)	Cork.	Limestone. *Carboniferous.*	Compact, slightly crystalline, veins of calcium carbonate.	Whitish grey.	171 15	172 1½	⅛	13 0	13 0	Very hard to work, owing to presence of veins of calc-spar. About 1½ft. super. of plain worked stone per day.

No.	Quarry.	County.	Geological Formation.	Description.	Colour.	Weight of a Cube Foot.		Water Absorbed per Cube Foot.	No. of Cube Feet to 1 ton.		Remarks. Where used, analysis, crushing strain in tons per ft. super-cost per cube foot.
						Dry.	Wet.		Dry.	Wet.	
						lb. oz.	lb. oz.	Pints.	ft. in.	ft. in.	
333	Scorthaun … Roscommon (3).	Roscommon.	Limestone. *Carboniferous.*	Compact, with crystalline fragments.	Grey, with brownish tinge.	172 6	172 8¼	⅛	13 0	13 0	Easily worked; 8ft. to 10ft. plain work in a day. Crushes with 1,084 tons.
334	Scrabo …… Newtonards.	Down.	Lower Keuper. *Trias.*	—	Greenish grey.	126 10¾ 141 15	136 8½ 149 10	7⅞ 6¼	17 8 15 9¼	16 4¾ 14 10¾	Wilkinson experimented on 21 beds of stone from three quarries; tabulated trials give extremes of results. Good working stone, from 13ft. to 15ft. plain work in a day. Crushes with from 144 to 680 tons.
335	*Shandon … Dungarvan.	Waterford.	Limestone. *Carboniferous.*	Highly crystalline, compact.	Light bluish grey.	169 6	169 14½	⅜	13 2½	13 2	The Disestablished church tower; county court; three large bridges. Stone is sold at 2s. per cube yard in quarry: Quarrymen get 15s. per week and explosives. Much of this stone comes to Newport, Mon., as ship's ballast. The Stone is used about Dungarvan for dressings to brick-built houses.
336	Shankhill …	Kilkenny.	Carlow Flags. Coal measures. *Carboniferous.*	Hard, thin bedded; silicious grit; calcareous.	Greyish blue.	163 9 169 11	165 10½ 170 5¼	1⅝ ⅛	13 8¼ 13 2½	13 6¼ 13 1¾	Chiefly a flag-stone quarry, the beds varying in thickness from ½in. to ¼in. Flags may be obtained 14ft. square. The flags are sometimes used for roofing.
337	*Sheephouse. Drogheda.	Louth.	Limestone. *Carboniferous.*	Compact, highly crystalline; distinct crystals of calcium carbonate.	Light grey.	168 6½	168 8¾	¼	13 3½	13 3½	1s. 6d. per *superficial* foot, delivered to Drogheda railway station.
338	Sherkin Island. Cape Clear.	Cork.	Old Red Sandstone. *Devonian.*	Quartzose, granular; micaceous, slaty.	Greenish grey.	167 0½	169 0½	1⅝	13 6½	13 3	R.C. Chapel, Bangs, and in and around Skibbereen, for dress work. Soft when quarried, hardens on exposure.
339	*Strang's Mill.	Waterford.	Limestone. *Carboniferous.*	Crystalline, compact, with splintery fracture.	Dark bluish grey.	168 12¼	168 14¾	⅛	13 3¼	13 3¼	This is the best stone for dressings, at present quarried near Waterford. The stone from Ballykilaboy was a better stone, but the quarry is closed. Strang's Mill quarry is worked by P. O. Keefe and Sons.
340	Tardree ……	Antrim.	Basalt. *Miocene.*	A pearlstone porphyry, with felspar crystals.	Greyish white.	141 0	146 8	4⅝	15 10½	15 3½	Easily worked. Crushes with 508 tons.
341	Taylor's Hill. Galway (1).	Galway.	Granite.	Highly crystalline, red and green felspar, dark-green mica.	Pink, with greenish tinge in places.	173 7	173 9¼	⅛	12 10¾	12 9¾	Limestone is generally used for building in the county town.
342	Two Mile Ditch. Galway (2).	Galway.	Limestone. *Carboniferous.*	Coarse, crystalline.	Bluish grey.	175 3¼	175 3¼	—	12 8½	12 8½	Court House, Galway. Works easily; 10 to 14ft. plain work per day. The rough blocks, as quarried, were sold for 2d. per cube foot.
343	Tuam ………… Quarry (¾).	Galway.	Limestone. *Carboniferous.*	Semi-crystalline; fossil remains.	Blackish grey.	171 14¾	172 1¾	¼	13 0¼	13 0¼	Crushes with 572 tons. (See 308.)
344	Wade's Point Kinsale.	Cork.	Lower Slate. *Carboniferous.*	Hard, chloritic; slightly micaceous.	Greenish grey.	165 12	169 7¾	3	13 6	13 2½	Used for general building purposes, though beddy.
345	Wakefield … Castlebar.	Mayo.	Limestone. *Carboniferous.*	Slightly oolitic, crystalline.	Light grey.	170 0	170 2	⅛	13 2	13 2	Flat bedded, Calpy, good for rubble walling. Crushes with 670 tons.
346	Westport … Workhouse Quarry.	Mayo.	Limestone. *Carboniferous.*	Granular, crystalline, with fragments of fossils.	Grey.	173 10½	173 15	1/6	12 10	12 10	Cherty. Hard to work.
347	Woodbine … Athy (1).	Kildare.	Limestone. *Carboniferous.*	Hard, compact, fine-grained, thin seams of calc spar.	Black.	173 15½	174 1¾	1/10	12 10½	12 10½	Hard to work. Seldom used for dressings. Crushes with 969 tons.
348	Valentia Island.	Kerry.	Slate.	Fine-grained, compact.	Purple.	177 5¼	177 5¼	—	12 7½	12 7½	Walling of Derriquin Castle. Exported to England and France. Used for roofing, walling, and some dressings. 6ft. plain surface per day, with the bed. Crushes with 846 tons on bed, 700 tons on edge.

THE VENTILATION AND FLUSHING OF SEWERS.

THE moot question of sewer ventilation has been discussed much of late years. Engineers and medical authorities are by no means agreed as to the mode by which the ventilation should be accomplished—whether by open surface gratings in the streets, or by shafts and ventilating tubes carried up at certain points, and the sanitary authorities of towns are still uncertain as to any definite policy. The medical officer of health to the Lowestoft Urban Sanitary Authority, Dr. Francis W. Clark, M.B., D.P.H., Camb., has presented a report upon the relation of the system of sewers by open manholes to the public health, which is partially founded on information he has obtained from various medical officers of health of other towns. Dr. Clark enters fully into the question, adducing the opinions of several sanitary experts, such as Sir Douglas Galton, Sir Robt. Rawlinson, Mr. James Mansergh, C.E., and others, on the subject of surface gratings. The increase of mortality from diphtheria in many towns is attributable to the plan of ventilating the sewers at the street level as one of several causes. The author, referring to school attendance, observes that those attending school would be most exposed to infection, especially if any offensive manhole existed in the neighbourhood of the school. The incidence of the disease would naturally fall on the pupils of that school, for diphtheria is a disease of childhood. The gullies in the school-yards would, by imperfect trapping, act as surface ventilators to the sewers. Mr. James Mansergh, C.E., a well-known specialist, referring to the sewers at Beckenham, proves that the multiplication of ventilators does not abolish the nuisance arising from surface gratings, for although there is a ventilator at every 82 yards throughout the district, which is in excess of the requirements of Sir R. Rawlinson (of 100 yards), yet annoyance is experienced from the surface gratings in spite of the good condition, self-cleansing, and flushing arrangements of the sewers. Dr. Clark quotes this case, as it "discounts the argument that if a surface grating is offensive, it is necessarily so as the result of some temporary and removable defect in the flow of sewage, which should be dealt with by flushing." Sewage, therefore, even in well-constructed sewers, will generate offensive gases, and these should be given vent at a considerable elevation. The report further goes on to show, what is well known—that all ventilators, surface as well as shaft, act both as inlets and outlets according to varying atmospheric conditions; that the emanations from these gratings have a depressing effect upon the vitality of the human organism, and predispose to diseases like enteric fever and diphtheria; that incidence of diphtheria in Lowestoft points to a gradual contamination of the sewers by the germs of this disease. The recommendations are that a less dangerous method of sewer ventilation than that of surface gratings should be adopted, and that systematic flushing be used. Dr. Clark maintains that the less the movement of the air of sewers, the less will the disease germs be carried into the outer air, and he contends that one of the greatest faults of the modern system of sewer ventilation is the creation of draughts throughout the length of our sewers. We must aim, he says, "on comparative stillness of the sewer-air, and be content to provide small outlets here and there at high elevations, which shall act solely as safety-valves, giving exit to the sewer-gas when the internal pressure is greater than that of the atmosphere, and *vice versâ*, admitting air to the sewers when the internal pressure becomes negative." We have no space to enter into the facts and data which have been collected from various towns, but refer to the remedies proposed. Dr. Clark's scheme avoids, on the one hand, the surface grating; on the other, the large and ungainly shafts, which would mar the front of any residential building. He suggests "that in all houses newly built, where the drains do not pass under the building, permission be given to dispense with the intercepting trap required by by-law 56 with respect to new streets and buildings, to be placed between the main drain of house and sewer. The soil-pipe or main drain would discharge direct into the sewer, and the ventilating shaft required by by-law 58 would act as a ventilator to the sewer; but under these circumstances the second opening, known as the fresh-air inlet, must be dispensed with. Seeing that it is almost invariably blocked up by the tenant in consequence of its acting as an outlet to the effluvia given off by the interceptor, this, it is thought, will be no great innovation. All remaining drains, both sink, waste-pipes, &c., must be provided with traps, so that these are not in aërial communication with the sewer. Where the drains pass beneath some portion of the building an intercepting trap is to be used as heretofore. Whenever an interceptor is inserted between the main house drain and sewer, a ventilating shaft of 4in. diameter will be provided and erected at the charge of the sanitary authority from the sewer side of the interceptor, carried above the eaves of the building; the ventilation of the house-drains to be effected as at present by two openings, one as an inlet for fresh air, and the other as an outlet for the gases in soil-pipe, &c. As to existing properties, it is proposed that the authority immediately close every surface ventilator that may be within 50 yards of any public school entrance, and all surface ventilators within the same distance of any existing ventilating shaft; the remaining surface ventilators not to be closed until permission to erect at least three 4in. ventilating shafts from the sewer side of the interceptors of adjacent property be granted. The opinions of medical officers which have been summarised show that the majority of authorities do not approve of man-hole ventilators, and that the suggestions made are generally approved.

* * *

Mr. Henry Irving, having had his attention called to the state of disrepair and discoloration of the marble tablet which was, in 1839, erected by Charles Kean to the memory of his father, Edmund Kean, on the wall of Richmond Church, has written to Mr. Skewes-Cox, the churchwarden of the parish, offering to bear the expense of restoring the memorial, and the necessary work is being carried out by Mr. Walter J. Long.

ROYAL ALEXANDRA HOSPITAL, RHYL.—STABLES, GRAYTHWAITE HALL, WINDERMERE.—SCULPTURE AT THE ROYAL ACADEMY.—THE NEW TOWER BRIDGE.—DESIGNS FOR NEW SCHOOLS FOR CHRIST'S HOSPITAL.—DECORATIVE DETAILS FROM THE HOME ARTS EXHIBITION.

Our Illustrations.

ROYAL ALEXANDRA HOSPITAL, RHYL.

The foundation-stone of this hospital has been laid to-day by the Prince and Princess of Wales. The architects are Messrs. A. Waterhouse and Son. We have no further particulars to hand.

THE NEW STABLES, GRAYTHWAITE HALL, WINDERMERE.

These stables have been built for Lieut.-Col. T. Myles Sandys, M.P. They consist of three blocks of buildings, forming three sides of a square, the fourth being inclosed by a wall and railing, and having the principal entrance in the centre, between the grooms' and coachman's houses. The block at the east side consists of coach-house, horse-washing room, cooking-rooms, &c. The corresponding block on the west side contains open shed, storerooms, &c. The south block, facing the entrance gateway, has the harness-room in the centre, and ranges of stalls and loose-boxes on either side. The loose-boxes are arranged so that each can be used as two stalls if desired. The whole of the buildings are two stories in height, the upper part being arranged as lofts and storerooms. A clock-tower is carried up in the centre of the south block. The whole are built of the local stone, quarried on the estate, in the lower parts, with red sandstone dressings and brick chimneys. The upper parts throughout are timber-framed, and the roofs covered with strawberry - coloured Staffordshire tiles. Internally, the stables are lined with pitch-pine boarding in the lower parts, with cream-coloured glazed bricks above, the floors being of granolithic. The contractors have been Mr. Pattinson, of Windermere, for the excavating, stone, and brickwork; Messrs. G. Woods and Son, of Bootle, Liverpool, for the woodwork, tiling, plastering, &c.; and Mr. Braythwaite, of Ulverston, for the plumbing, glazing, and painting. The stable fittings are by Messrs. Musgrave, of Belfast. The clerk of the works has been Mr. C. Noble, and the whole of the works are from the designs, and carried out under the superintendence, of Mr. R. Knill Freeman, F.R.I.B.A., architect, of Bolton and Manchester.

SCULPTURE AT THE ROYAL ACADEMY.

These two panels of "Night" and "Morning," designed by Mr. Frederick E. C. Schenck, illustrate the quotations which the author has chosen to be fixed to his work. Both passages are printed on our plate, which is taken from photographs printed from the originals now on view in the Lecture Theatre Gallery at the Royal Academy. We have already referred to Mr. Schenck's work when we described all the leading works of sculpture now at Burlington House, so that no more remains to be said in this place beyond a word of further commendation to him for both these capital reliefs.

THE TOWER BRIDGE.

The week before last, when the Prince and Princess of Wales opened this bridge, we gave general drawings of the structure and some details of the towers. The full description printed at the same time furnished the leading particulars of the work and its construction. To-day we give the general elevations of the façades and flanks of the main towers from drawings by Mr. George D. Stevenson, A.R.I.B.A., the architect engaged to perfect the design and modify the work, so as to adapt the buildings to the altered requirements of the engineer, Mr. Wolfe Barry, C.B. So truly national a work cannot fail to interest a very large class of our readers, and we propose to follow up our present and previous plates with other drawings, none of which have been illustrated in any other journal.

CHRIST'S HOSPITAL NEW BOARDING SCHOOLS, HORSHAM.

The double-page plate given herewith illustrates the dining-hall of Messrs. Aston Webb and Ingress Bell's selected design, and so we complete our very exhaustive series of plans and views of this very admirable and successful scheme. During the last three weeks we have given the only comprehensive illustrations published of this great competition. Last Friday the dining-halls designed by Messrs. Paley, Austin, and Paley, and Mr. Thomas E. Colcutt, were illustrated. To-day we print Mr. Hubert Austin's design for the college chapel, which certainly is treated cleverly, with much of that masterly freedom which the executed work of his firm accustoms us to expect at their hands. Dignified as this interior undoubtedly is, we cannot say that its special fitness as a college chapel, as distinguished from a parish church, is quite so manifest as custom usually dictates.

DECORATIVE DETAILS FROM THE HOME ARTS EXHIBITION.

In our issue of June 29th last we gave an account of the Home Arts and Industries Exhibition at the Royal Albert Hall. We now supplement this with some sketches taken on the spot. The Fender Box, in unpolished walnut, was inlaid in various coloured woods, and made a rich-looking article, the Toadstools being in orange, crimson, &c., with here and there a black one. The ornament was designed by the Hon. Mabel de Grey, and was executed by John Reason. The Hymn Indicator, also in walnut, was constructed by J. Macmullan, and carved by H. Baster. The Hanging Cupboard was in unpolished oak, and contained some nice carved work, the two demure figures, of which we give a sketch of one, making quaint terminals to the two sides. It was constructed by Thos. Funnell, and carved by Harry Skelton. The "Waiter," inlaid in walnut, was designed by the Hon. O. de Grey, and was made by J. Macmullan, and ornamented by J. Bray. The Wrought-iron Candle Bracket and the Wooden Potato Bowl are both interesting in their respective materials. The former was designed by the late Canon Sutton, and made by F. Coldron; the latter Messrs Voisey and Wm. Tooke are responsible for.

CHIPS.

Mr. John Morgan, surveyor, R.E. Civil Staff, has just retired, after a service of 34 years, having been stationed during this period at Aldershot, Curragh, Portsmouth, Mauritius, Woolwich, Belfast, and other places.

Mr. Thomas Berry, surveyor, R.E. Civil Staff, has just retired, after a service of 35 years, having been stationed during this period at York, Straits Settlements, Devonport, Nova Scotia, Dover, Dublin, and other places.

A new Wesleyan church, with seats for 600 persons, has been erected at Ashton-on-Ribble, at a cost of £3,442.

It is proposed to place in the church of St. Michael, Coventry, probably on the north wall of the interior of the great tower, a large memorial brass in memory of all the bishops who have ruled the several dioceses in which that old Saxon tower has been placed from the time of the creation of the Mercian see at Repton, in the year 656, to the present day. On this memorial will be inscribed the names and dates of consecration of 4 Bishops of Mercia, 31 Bishops of Lichfield, 6 Bishops of Coventry, 33 Bishops of Coventry and Lichfield, 13 Bishops of Lichfield and Coventry, 4 Bishops of Worcester, 1 Bishop Suffragan of Coventry. The arms of the Archbishop of Coventry and the United Bishopric of Coventry and Lichfield, and the Bishopric of Worcester, with other devices, will be engraved and coloured on the brass.

COMPETITIONS.

Bristol.—A special meeting of the Bristol Finance Committee was held on Tuesday to consider the designs sent in for laying out the ground above St. Augustine's Bridge as an open space. In answer to the committee's advertisement upwards of forty designs were sent in, and premiums of £50, £30, and £20 were offered. The premiums have been awarded as follows:—First, £50, Messrs. W. J. Taylor and H. J. Weston, Associate of the Institute of Civil Engineers, 24, Portland-street, Southampton; second, £30, Mr. Edward S. Sinnott, Associate of the Institute of Civil Engineers, Bristol, who designed the exhibition building; third, £20, Mr. Thomas H. Mawson, garden architect, Windermere and Market Drayton. The three selected plans will be open for the inspection of the town council, together with any others that members might desire to have submitted. It does not follow that either of the plans awarded premiums will be adopted, because the element of cost has not yet been considered.

Goole.—At a meeting of the General Purposes Committee of the Goole Local Board, held on Wednesday week, the report of Mr. Brown, "architect and builder," Liverpool, who was engaged by the board to advise on the plans for the new Market Hall, was submitted for the consideration of the members. The statement is an exhaustive one, and fully explains the reasons why particular plans are recommended for acceptance or rejection. The committee thereupon decided to inspect the plans once more, and for this purpose they assembled at the place of exhibition in Carter-street subsequently. The matter was fully discussed, and it was agreed to recommend that the first prize of £100 should be awarded to the design of a particular set of plans which were placed first in the order of merit by Mr. Brown, and a keen contest ensued between two plans as to which should be awarded the second prize of £50. It was expected that at the monthly meeting of the board, on Wednesday evening, a resolution would be passed deciding upon the meritorious plans, and that afterwards the sealed letters of the exhibitors would be opened; but our telegram to the Clerk of the Board has elicited no answer up to the time of going to press.

Kirkham, Lancashire.—At a meeting of the Fylde Board of Guardians, held at Kirkham on Wednesday week, the first premium was awarded to designs submitted by Messrs. Haywood and Harrison, of Accrington and Lytham, in an open competition for new union offices, board-room, and receiving wards, at an estimated cost of £2,000.

Lancashire County Cricket Club. — We understand that Mr. Thomas Muirhead, whose design was placed first in the recent competition for a new pavilion by the assessor, Mr. Frank T. Verity, has been appointed to carry out the work.

Southend-on-Sea.—The school board having decided to build another school situate on the Leigh-road, invitations were issued to architects practising within the borough for designs in competition. Mr. F. W. Roper, A.R.I.B.A., was engaged to advise the board upon the plans and specifications. At the result of Mr. Roper's report, it was decided to adopt the designs submitted by "Knowledge," subject to any modifications required by the board. The author of these plans is Mr. W. Yendall Hobbiss, architect, Clarence-road, Southend-on-Sea. There were four other competitors.

◆

The death is announced of Mr. Edward Clarke. While speaking to a stageman, named Fox, on Monday, he complained of being unwell, and asked to be taken into the Alhambra. His request was complied with, and he expired within a few minutes. He built the Ilford Local Board offices, the design for which we illustrated June 23, 1893; and also was the author of the design for the Ripon Cemetery buildings, illustrated April 14, 1893.

The class-rooms of both the girls' and boys' schools at Clevedon are about to be enlarged. Tenders for the work were opened at a committee meeting on Thursday week, from Mr. T. Hill, £306; Mr. W. A. Green, £295; Mr. W. H. Drewett, £265; and Mr. Jas. Chapman (Bristol), £259. The tender of Mr. Drewitt was accepted. Mr. H. Hewlett is the architect.

It has been decided to hold the annual excursion of the Northern Architectural Association at Thirsk, Rievaux, and neighbourhood, on Saturday, the 21st of July.

WAYSIDE NOTES.

I learn that the Select Committee on the accommodation of the House of Commons has decided by a large majority not to increase the actual legislative Chamber. There is great unanimity in favour of putting the kitchen on the second floor. There are on that story rooms, now occupied by the servants of the House, more than sufficient for the demands of the kitchen; and if this desirable change were made members would be able to take their meals in the existing dining-rooms free from the insufferable heat and unpleasant fumes which consitute a perpetual source of annoyance and complaint. The accommodation and conveniences of the Press Gallery were investigated at the sitting of the Committee on Wednesday; but nothing very definite was arrived at. If it were not probable that by the political changes of the near future the number of members of the House of Commons will be greatly reduced—possibly to one-half, it would be desirable to begin to agitate for the radical changes in the structure which have been more than once indicated by Mr. Masey, Mr. Barry, and others in these columns. Tinkering of the sort that seems in favour with the Select Committee is of little use.

Sir Henry Layard, whose death, at the age of 77, occurred last week, for 15 years had taken no part in British affairs, with one unimportant exception. But for nearly half a century he was one of the most prominent of Englishmen. To students his volumes on Nineveh are of paramount interest, and the sculptures he secured for the British Museum constitute an everlasting monument to his zeal as an explorer. But his life-work was really that of a politician and diplomatist. He seemed mostly in his latter capacity to put himself in opposition to events; but he was energetic, and ever English, and could go for an opponent like one of his own Assyrian bulls might have done. Few other busy men have done so much for archæological research.

Mr. Weir overstated his case in the House of Commons when he said that there were always unscrupulous builders who would not be deterred from erecting houses merely because the site was swampy. The "unscrupulous builder" has to build where he can, and Mr. Weir's object, which was a good one, need not have been prejudiced by the slander of builders. His motion, which practically had for its object the insertion of provisions in the London Streets and Buildings Bill, which would render it compulsory to deal effectually with all surface-water, was defeated. Further legislation in this direction cannot be much longer delayed; but it must be taken on the action of the London County Council, and with care. If an architect's superintendence were compulsory in all cases, it would seldom be needed.

From what I hear, there is to be a select competition for the new Roman Catholic cathedral which, if rumour be true, is to be built at Westminster, on the site which was bought for the purpose many years ago, adjoining the Archbishop's house, and close to the Vauxhall Bridge-road. Among the names suggested as likely to be invited to take part in this contest are Messrs. J. F. Bentley, Dunn, Hansom, and Dunn, H. A. K. Gribble, Leonard Stokes, Pugin and Pugin, Goldie and Child, Bernard Smith, and F. A. Walters. Anyway, it seems that a strenuous endeavour has been made on the part of some few architects associated with the Italian Mission in this country to secure the job, which is being "kept very quiet" at headquarters, and so far I have not heard of any appointment having been actually made, though rumours have been circulated in favour of one pushing gentleman whose name is generally kept well to the front of professional affairs. Lack of adequate funds will necessitate a less ambitious scheme than that which distinguished the masterly French Gothic design prepared some twenty years ago by Mr. Henry Clutton, the highly capable R.C. architect, and relative of the late Cardinal-Archbishop Manning. A decided contrast with the grand historic abbey church of St. Peter, at Westminster, is naturally enough to be preferred to an attempt to vie with its scale and beauty or style, while, on the other hand, a repetition of the Oratory church at Bromptom is certainly not in favour with many from whom material help is expected, and so as a compromise a Basilican type of church is contemplated. Whether its detail is to assume a Classic character or embody a free development of the Mediæval style is seemingly hardly settled. The problem in either case must be considered as a highly interesting one, architecturally speaking.

Public dining-rooms and restaurant facilities continue to develop in London in a very sumptuous and attractive style, much to the detriment of the West-End clubs, whose members no longer entertain their friends therein so hospitably as heretofore, or even dine themselves at their clubs so frequently as they used to do. The new hotels built of late years now afford facilities for the dining public at more moderate prices, and furnish their tables so well as to attract an increasing amount of custom. In evidence of this development I may mention the costly extension of the Holborn Restaurant, which Mr. T. E. Collcutt, the architect of the Imperial Institute, has in hand for the Gordon Hotels Company. The main feature of the scheme will consist of a great banqueting hall, and the cost, which I have heard mentioned, is about, if not over, £50,000. The present building, with its marble and expensively gilded fittings, designed by the late firm of architects, Messrs. Archer and Green, must have cost a very considerable sum also, whatever may be said about its architectural merit.

The Art Union of London on Monday established, in the Court of Appeal, its claim to exemption from rateability—in respect of its premises in the Strand—as a society instituted for purposes of fine art exclusively. The Union was defeated in the Divisional Court, and only secured the judgment of a majority of the Court of Appeal. The chief objection appears to have been the lottery system which the Art Union is authorised to carry on, in furtherance of its objects, and which, it might be contended, imported into the case an element of gain inconsistent with its avowed character as a society solely for the advancement of art. But the Court of Appeal overruled this objection on the facts, and the Art Union has thus gained a decisive, though not a bloodless, victory over the rating authorities. It need hardly be pointed out that the exemption of such bodies throws the extra burden on the general ratepayers.

The *Times* states that there is a proposal to convert Wolvesey Palace, Winchester, into a diocesan church-house, a movement that has been set on foot by the Bishop of Winchester and Dean Kitchen. The palace is near the river Itchin, between Winchester College and the deanery gardens. It would be a great pity that a property of such historic interest should be allowed to be sold as proposed some time ago. The original Wolvesey Castle was built by Bishop Blois about A.D. 1138, on the site of the ancient Episcopal Palace. It was dismantled during the turbulent reign of Henry III., and finally destroyed by Cromwell in 1646. The ruins now remaining belong to the Keep, which was built of flints. The present episcopal palace was began by Bishop Morley, under Sir Christopher Wren, after Cromwell's time, but was never completed. Several features of interest and some good ornament of the Norman and Transitional periods are, we believe, visible.

The development of the American "sky-scraping" structures in New York, Chicago, and other cities of the United States, threatens to outdo itself. The improvements of lifts and elevators, and the perfection of the steel frame manufacture have given renewed impetus to the erection of these atrocities. The self-supporting wall has been supplanted by the steel cage or frame, which, as our readers know, gives support to the curtain wall or screen, so that the wall of each story is independent of those above and below it. The masonry-built wall of the earlier structures of this class occupied too much valuable space in the basement and lower stories, therefore there was only one alternative—to abandon the "high" building or to make it a framework of steel. A large number of very respectable buildings are now being bought by capitalists to pull down, so that one monster erection of 20 stories may take their place. We are glad our Australian cousins are not likely to repeat the experiment, and the *Australian Builder* expresses the hope that "those colonies will never come to copy such constructional atrocities of the Yankee."

BOOKS RECEIVED.

A History of Westmoreland, by Richard G. Ferguson, M.A., LL.M., F.S.A., Chancellor of Carlisle (London: Elliot Stock), is another addition to the "Popular County Histories" which Mr. Elliott Stock has been bringing out at intervals. We have no space to examine the History which the learned author has compiled from various authenticated sources, such as the papers in the *Transactions* of the Cumberland and Westmoreland Antiquarian and Archæological Society. The present Chancellor of Carlisle's own local works have furnished a great deal of the present volume. As in other volumes of this series, the work deals first with the early inhabitants of Westmoreland, the Roman conquest, describing the antiquities, the Norman settlements; the baronies of Appleby and of Kendal, held directly from the Crown, are minutely described with their charters and local incidents. The 15th, 16th, and 17th centuries, the troubles and the times of the Restoration and the Revolution, form interesting chapters in a volume which displays considerable topographical and antiquarian learning and research. It is a decided omission that there are no maps or illustrations; a map of the county, or a few small-scale maps of certain localities would add greatly to the value and interest of these local histories.——*Concrete: its Use in Building*, by Thomas Potter, new edition (London: B. T. Batsford, High Holborn), is a new edition of the author's work on this valuable building material, describing the making and mixing of concrete, the construction of concrete walls, floors, roofs, and other things. The work has been entirely re-written, and is a bulkier volume than the last. Mr. Potter lays all the leading authorities under contribution, and many of the data relating to the subject have been given in our own pages. The second part or volume contains chapters on monolithic walls, wall blocks like Hayward's building blocks, slab walls describing the various forms of slabs on the market; paving fireproof floors and roofs, concrete stairs, tanks, &c. In these chapters the author discusses more or less fully the question of fireproof floors, the effect of fire on floors of concrete and iron, their strength, expansion, and the illustrations given clearly explain the different systems in use. We see the Homan's floor, the Doulton-Peto, Millar's, Lindsay's, and the Fawcett, and other recent types of concrete floor have been introduced. As a treatise on the manufacture and practical applications of concrete, Mr. Potter's work deserves a high place.——*Stresses in Girder and Roof Trusses*, by F. R. Johnson, Assoc.M.Inst.C.E. (London: E. and F. N. Spon, Strand), will be welcome to a large class of architects, engineers, and draughtsmen who have no time or inclination for mathematical calculation. Mr. Johnson simplifies the process for both dead and live loads by simple multiplication. Stress constants for 100 cases are furnished in the form of tables, accompanied by truss diagrams, so that all that is necessary is to find out the kind of truss required and its condition and the stress constants, and to multiply these by the panel load to give the maximum stress on any member. Of course, it is always possible to calculate the stresses of a roof or girder due to dead or live load in the term of a unit panel load, but the author's book will facilitate the operation by giving all the constants necessary for ordinary structures. The introductory remarks and abbreviations used enable the most unpractised to learn the method. Thus for a lattice girder, each panel of which is covered with a unit load of, say, 1 ton, or any other unit, distributed over each of the 12 panels, the resulting stresses in terms of the load are given. Each of the truss diagrams has the load-line marked either on the bottom or top flange, and the numbers on the diagrams indicate each member of the girder. Looking at the table under the head of any particular loading, we find the panel number, and opposite it the stress constant with its sign + or −, the first signifying compression, and the second tension. The book includes lattice Linville, inverted Linville, Warren, parabolic bowstring, braced trusses, and every kind of roof truss ordinarily used. An index to the various type given is wanted for reference. Mr. Johnson's little book is just the one that every architect and engineering draughtsman wants, as many a weary and unreliable calculation may be saved by its use.——*A History of Tong, Shropshire, and Notes on Boscobel*, by George Griffiths, illustrated by Edmund H. New, Gertrude M. Bradley, and Chas. W. S. Dixon (London: Simpkin, Marshall, Hamilton, Kent, and Co., Ltd.)—The volume on our desk is a second edition of an interesting history of Tong and its church. The church is much visited for its historic associations and monuments and altar-tombs. A good plan and several sketches are given. In plan, Tong Church has a nave and two aisles, a south porch and chapel, a central tower over the nave at the east end, and a long chancel, and has undergone few changes. The tower is an octagon above the square, and is crowned by a low spire and embattled parapets, the style of the edifice being Early Perpendicular. Many interesting features are to be found, which are here described and illustrated, such as the Vernon chapel, with its fan-traceried vaulting; the stalls, richly carved; choir-screen; seven fine altar-tombs, &c. The screen between chancel and tower is Transitional, of elaborate design, and in good preservation. The cornice is carved with oak-leaves and acorns, and the surbase is enriched with the vine. The plates of effigies in the Vernon chapel, &c., are interesting, and the work is full of inscriptions and quotations from various sources. As a guide to the church and neighbourhood, Mr. Griffiths's work will be found of much interest.

Building Intelligence.

Bristol Cathedral.—At the last meeting of the executive committee, the report of the clerk of the works stated that the tower would probably be finished by the end of the present month. The four pinnacles at the base of the turret-spire have still to be restored, after which the scaffolding will gradually be removed. The turret on the east side of the north transept will now be proceeded with, and this will complete all the exterior work west of the choir. With regard to the interior, the marble paving of the choir-floor is being prepared, and will shortly be laid down upon a raised bed of concrete. Services will be held in the nave, as the choir will be screened off by a hoarding, to enable the improvements already undertaken to be proceeded with. A contract has been signed for the removal and reconstruction of the stalls at a sum of £1,384. The committee also had before them the matter of the ceiling of the choir, aisles, and transepts. It will have been noticed that this has for a long time been in a very defaced and discreditable condition, the distemper, which was placed on the roof about 1860, having to a great extent perished. The architect has pronounced the plaster, with which the grained and panelled ceiling is covered, to be, without doubt, ancient, and it has therefore been decided to preserve it for future decoration, as originally intended, only cleaning and distempering it afresh for the present. The present condition of the ceiling has probably arisen from imperfect ventilation; steps have therefore been taken to secure the best advice as to the most effectual method of ventilating the Cathedral. On the matter of lighting the choir, it was generally agreed that it should be electricity and not by gas. Mr. Cowlin, the contractor, has now furnished estimates for the restoration of the north arm of the cloisters, running parallel to the nave, and dating from the end of the 15th century, three bays of which may still be seen in a ruinous condition. The cost of restoring each bay will be £148.

Burley.—The memorial stones of a new Primitive Methodist Chapel were laid at Burley last Saturday. Messrs. Howdill are the architects. The designs show a building in the Gothic style of the 13th century, simply treated. The chapel will comprise a nave and choir (with apsidal termination) 70ft. long, and side aisles 53ft. long, divided from the nave by a stone arcading. A rectangular tower will rise to a height of 65ft. The structure will be of Burley pitch-faced stone, with dressings of Horsforth stone. Welsh slates will cover the roof, and the roof principals will be of dressed Baltic redwood. Pitch-pine sittings will be provided for 608 persons, and the cost of the structure is estimated at £2,400.

Charing Cross Hospital Convalescent Home.—We published on April 28, 1893, a double-page illustration of the Charing Cross Hospital Convalescent Home, the foundation stone of which was laid yesterday at Oxted by Mr. J. Passmore Edwards, who sent a cheque in 1891 for £5,000 towards its cost, and has guaranteed to defray whatever more may be required. Some slight modifications in the design have been made since we published our illustration. The architect is Mr. John J. Thomson, A.R.I.B.A., of 1, Durham-place, Chelsea, whose plans were accepted in a limited competition. The home will accommodate 50 patients, and the general dining-hall will seat 72, thus providing for future additions to the wards.

Edinburgh.—The new parish church of St. Cuthbert's, Edinburgh, was opened on Wednesday. Except the western tower, which was erected in 1789, the entire building has been reconstructed from the foundation. The architect is Mr. Hippolyte Blanc, A.R.S.A. The retention of the tower determined the style of the edifice, which if that of the Early Italian Renaissance. The seating accommodation is larger than that of the old building, though there is only one gallery, and the large apse, nearly 40ft. deep and 30ft. broad, is not included in the allocation, being reserved for the choir and elders' seats. The chancel is approached by marble steps, and a further ascent beyond the choir leads to a plinth, partly of marble and partly of mosaic, on which stands the Communion table. The structural material of the table is ivory-tinted statuary marble, the front being divided into three panels by pilasters and capitals delicately carved. The table is based upon early examples of the Byzantine date, with adaptations of the best period of Italian Renaissance work. A scheme of stained-glass windows has been prepared, of which a number have already been presented. Two oaken carved seats for the collegiate ministers have been placed at the entrance to the choir. On either side of the apse large chambers have been left for the organ, only one of these being occupied at present by an instrument which has been introduced for temporary use. An extremely plain wooden pulpit has also meantime been erected on the north side of the chancel. The font in use in the old church, the work of the late Mr. Brodie, is of Caen stone, and has been placed on a marble plinth on the south side of the chancel. Vestries for the ministers are provided on either side of the apse. The building has cost considerably over £20,000.

Harrogate.—On Tuesday afternoon the Mayor of Harrogate laid the memorial-stone of the new Montpellier Baths, Harrogate. Designed in the style of the English Renaissance, the building, 260ft. long by 190ft. high, is grouped with a dome as central feature, backed by two towers, and flanked by raised pavilions. It consists of central hall or pump-room for the use of water-drinkers; a winter garden; suites of special and slipper-bath rooms and dressing-rooms for ladies and gentlemen; a Turkish bath and rooms for the pulverisation and inhalation of the waters, dry massage, and other treatments. The whole of this accommodation is on one level. In connection with the central hall are cooling, reading, and refreshment rooms, besides manager's office, &c. The winter garden is 220ft. long and 42ft. wide, covered with a curved glass roof, and ornamented with a fountain and flower-beds. The estimated cost is £100,000. The architects are Messrs. Baggallay and Bristowe.

Widnes.—The foundation-stone was laid last week at Widnes of a free library and technical school. The buildings are to cost about £10,000. The designs are by Messrs. Woodhouse and Willoughby, Manchester. The style is English Renaissance, and the material to be used is red Ruabon brick, with terracotta dressings. In the technical school ample provision is to be made for the teaching of chemistry, the most important technical subject in the Widnes district. The laboratory will have accommodation for about 50 students, and there will also be a large chemical lecture theatre. The rooms in the library are grouped round the lending department. The reading-room will have a lofty, open-timbered roof. Provision will be made in gallery-form for the storage of 50,000 volumes.

It has been decided to aim at a complete restoration of the north aisle of Leek Church, and to extend the aisle as far as the tower. The preparation of the necessary plans has been intrusted to Mr. A. E. Street, who designed the present chancel. Probably some £2,000 will be required.

Correspondence.

CRIPPLEGATE INSTITUTE.

To the Editor of the Building News.

Sir,—My attention has been drawn to the description of the above building given in your last week's number, wherein it is stated that "plans in competition from many well-known architects were sent in, and both Mr. Smith's two designs were placed first by Mr. MacVicar Anderson." If this be true, it certainly does look bad for the "many well-known architects"; but I venture to think there is some mistake. At any rate, let us have their names.

Several who were invited to compete very properly refused to do so, owing to the conditions of the competition, one of which was that the successful architect should be paid only 4 per cent. commission upon the cost of the building, and that the premium was to be merged in this amount. This means that, allowing for the cost of the competition drawings, the successful architect would receive about 3½ per cent. for his work, and it is my impression that no architect with any self-respect, or any regard for his brother architects, would compete under such conditions. Among those who refused were Mr. Brydon, Mr. Murray, and yours, &c.,

Ed. W. Mountford.

17, Buckingham-street, Strand, W.C.
July 12.

MARYLEBONE BATHS COMPETITION.

Sir,—Will you permit me to say, in connection with the above, how very unsatisfactory in the result were the instructions issued to competitors?

Previous to parting with the sovereign asked for the instructions, I called on the clerk and asked to see a copy of the instructions. These were shown me, and I at once asked for some information as to the cost intended to be gone to, as there was nothing to guide competitors. The clerk at once told me that it could not be done properly for *less* than £50,000, as a previous suggestion as to a partial alteration had been vetoed, on the ground that the whole thing had better be done well. I naturally took these figures as an approximate outlay, and made my plans accordingly.

Of the award itself my mouth, as a competitor, is closed, and when I say that amongst the plans hidden away at Boscobel-place, instead of being shown with the prize plans, at least a dozen sets were far ahead of my own, I think I cannot be accused of any improper motive in writing this; but I do feel that, although plan is the very first consideration in such a scheme, it did not present opportunities for architectural beauty of elevation; but the prices which I understand it is proposed to go to would certainly preclude anything which may be called striking in the way of design being adopted.

I would again repeat, I do not criticise the award itself; but I think those responsible might have also, in common courtesy to those spending so much time and thought on plans, have exhibited all the drawings together in one convenient place, for their inspection.—I am, &c.,

Chas. E. Savery, M.S.A.

2, St. George's-square, S.W.

TOWER BRIDGE.

Sir,—Mr. E. Marsland, in criticising the Tower Bridge, shows that he is not at all conversant with his subject. If Mr. Marsland had seen the works as they progressed, it would have been evident to him that the engineer and architect were working well together. At the same time, it should be remembered that the Tower Bridge is no ordinary building; the ironwork is very complicated, and has many moving parts, leaving the architect anything but a free hand. If Mr. Marsland knew the many obstacles which arose during the construction, he would be better able to appreciate the merits of the architect, who has successfully overcome them. Your correspondent speaks of the multitude of windows. There is nothing of the kind; the windows are simply placed where required, to light staircases, landings, lifts, &c.

With regard to the corbelling of the angle columns from the round to the octagon, many people hold a different opinion to your correspondent. It was absolutely necessary to corbel out, on account of the huge suspension-chain bearings, which cut nearly through the masonry at this point.

Why blame the architect for "the skeleton arms in all their naked ugliness"? These are, of course, the work of the engineer; and, judging from the ornamental ironwork designed by the architect, there is no doubt he had "ample resources" had it been thought necessary to clothe the "skeletons."

When Mr. Marsland criticises the engineer, he is still more hopelessly at sea. He would do away with the suspension chains and put a lattice girder to carry the side spans, similar to those of the top footway. Is he aware that the top footway is only about 13ft. wide and 200ft. long, and only carries pedestrian traffic? Yet it needs girders 13ft. deep. What would be the depth of girders to carry, in a similar manner, the side spans, which are 60ft. wide, 270ft. long, and carry heavy road traffic? They would indeed "have a substantial appearance," would be vastly more of an "eyesore" than the suspension chains, and swamp the whole composition, which at present combines strength with dignity.

I do not think there are many who share Mr. Marsland's regrets. Those who *do* know something of the matter, consider that Mr. G. D. Stevenson has, under the circumstances, dealt very successfully with the architecture.—I am, &c., A.R.I.B.A.

Intercommunication.

QUESTIONS.

[11177.]—**Sash and Roof.**—Can anyone tell me what a Venetian sash is? Also a De Lormer roof? Questions upon these were set at a recent technical examination, and doubtless a reply would interest others as well as myself.—CANDIDATE.

[11178.]—**Fixing Tiles.**—I should be glad if someone would kindly inform me as to the best means of fixing tiles to a 9in. wall? I understand the method for studwork, but should prefer an opinion before advising.—ENQUIRER.

[11179.]—**Thrusts on Walls and Arches.**—Will some student who is reading the important article on "Thrusts on Walls and Arches," now appearing in the "B. N.," give me a demonstration of the following? In last week's "B. N.," p. 4, Fig. 13, B F is the line bisecting angle D B A, and it is assumed that it is only the wedge-shaped piece of earth D B F which tends to overturn the wall. The whole object of the investigation is to find the pressure on the back of the wall. Then why assume that it is only this wedge, D B F, which causes the pressure, and not a greater or smaller one?—J. B.

[11180.]—**Details.**—Will some of your professional readers kindly enlighten me as to the scale of detail charges it is customary to make in London and district for small surveys of land and buildings for conveyance or transfer, &c.?—TEMPLETON.

REPLIES.

[11176.]—**Payment for Quantities.**—The surveyor's fees for the quantities become due on the signing of the contract, and immediately the contractor receives a first instalment, the surveyor should send his account. If the contractor declines to pay, a writ should be served.—HENRY LOVEGROVE.

CHIPS.

Messrs. E. H. Shorland and Brother, of Manchester, have just supplied some more of their patent Manchester stoves to the Westhulme Hospitals, Oldham, the patent Manchester stoves previously supplied having proved very satisfactory.

The Congregational Church, Burton-on-Trent, is to be newly seated, and to undergo thorough restoration and decoration, from the plans, designs, and under the superintendence of Mr. R. E. Carpenter, architect, of Burton.

Holy Trinity Schools, Burton-on-Trent, are being enlarged from the plans and under the supervision of Mr. R. E. Carpenter, architect, Burton, as approved by the Educational Department. The builder is Mr. J. Parlow, of Burton.

The Frome (Somerset) Rural Sanitary Authority have appointed Mr. J. E. Willcox, C.E., of Birmingham, consulting engineer in connection with the scheme for water supply for the district of Coleford, which has been prepared by their surveyor, Mr. W. T. Purnell.

The Stourport Local Board have called in Mr. J. E. Willcox, C.E., of Birmingham, to advise and report upon the question of sewerage and sewage disposal of the district.

The Sowerby District National Schools, near Halifax, are proposed to be again enlarged by an addition to the girls' school, and Mr. Patchett, architect, Halifax, has prepared plans for that purpose. This will be the fourth time he has extended them during the last 25 years. There is no school board in the village.

Legal.

ABOUT FIRE-PLUGS.

THE Court of Appeal has been seriously engaged in considering who should pay for the fire-plugs fixed and kept in repair by the Grand Junction Waterworks Company in the district of Brentford during the last six years. In order to settle this matter the water company sued the Brentford Local Board for the whole sum so expended, and after getting judgment in full at the trial before Mr. Justice Lawrance, the Court of Appeal has now reversed the whole of his decision, and left the water company to bear the cost of their litigation as well as the expense of their fire-plugs. The case is really an instructive instance of our municipal muddling and the divisions of local power and local authorities, although Lord Justice Lindley gave a decision which is clear enough upon the statutes. As to the facts, it appears that the water company fixed a lot of fire-plugs in the roads of Brentford, some before and some after the Local Board for that place was created, and they kept them in repair. Lately coming across certain sections in the Waterworks Clauses Act and the Public Health Act, it occurred to the water company that the Local Board having used their fire-plugs should be liable to pay for their fixing and repair, in the same way as if the Board had requested the company to lay down such fire-plugs, as they can do under these statutes.

The Court of Appeal, however, held that as a matter of fact there had been no such express request, and that none could be implied from the subsequent user of the fire-plugs by the public. They also ruled that although the Local Board was bound to provide fire-plugs, and could be compelled to do so by the Attorney-General acting under the power of the Public Health Act, this had nothing to do with the relations of the Board and the water company. It was, indeed, the duty of the local authority to fix fire-plugs, and it could and should request the water company to do so, and if it did, then the Local Board would be liable for the cost and repair of these plugs. Private owners might also require the water company to fix such plugs, and this would then be done at their expense. Here the water company had been good enough to fix the fire-plugs and repair them without being asked by anyone, and so they had no remedy. The end of this case is simple justice, though it be arrived at oddly, and it would have saved many muddles of this sort had the companies who sell the water at a good profit been throughout compelled to fix and keep in repair all fire-plugs for the use of the public.

FRED. WETHERFIELD, Solicitor.
1, Gresham Buildings, Guildhall, E.C.

NOTE.—All questions for reply in this column must be headed "BUILDING NEWS," and must reach my offices, as above, by *Tuesday* morning to insure answer same week.

P. AND P.—ARCHITECT.—CONTRACT.—EXTRAS.—It may depend on the form of the contract; but you should refuse to pay such a claim without particulars and the plans, &c. The extras seem enormous in so small a job. Better consult your solicitor, and let him defend any action they may bring.

G. H. G.—LIGHT.—CHURCH.—OBSTRUCTION.—There is no special limit within which buildings can be erected; nor is the matter governed by any angle, as suggested. It is, in each case, simply a question of fact whether the obstruction will substantially reduce the light hitherto enjoyed by the dominant tenement, and if it will, then the Court will interfere by an injunction, or give damages.

Earl Stanhope laid the foundation-stone of the new Church of All Souls', Cheriton, on Tuesday week. The edifice is being built at a cost of £4,000.

The sixth annual exhibition of the Artists' Guild will be held, under the patronage of Princess Christian, at South Kensington, in November next. The judges will be Messrs. W. P. Frith, R.A., H. Stacey Marks, R.A., Walter Severn, Leslie Ward, Mrs. E. M. Ward, Mrs. Jopling, and Miss Rowe.

On Sunday, the dedication took place of a new east window erected in St. Andrew's church, Beamish. The building, which has cost something like £1,600, is in every way adapted to meet the requirements of the growing population. On the ground floor there are two classrooms and caretaker's house, &c., whilst on the second-floor there is a hall, with sitting accommodation for 240 people, besides the various ante-rooms, &c. The architects for the buildings are Messrs. J. Smith and Sons, Shotley Bridge.

LEGAL INTELLIGENCE.

THE RESPONSIBILITIES OF BUILDERS.—An exceptional case was heard before Judge French, at the Shoreditch County-court on Tuesday, by which James Greenaway, bricklayer's labourer, of 16, Brettenham-road, Edmonton, sued Mr. John Anley, builder, of 27, Dalston-lane, to recover £50 damages for injuries sustained through the alleged negligence of defendant's servant. Mr. Salter appeared for plaintiff, and Mr. Ruegg for the defendant. Plaintiff's case was that on March 29th he was in defendant's employ, and was removing some *débris* from a house in course of construction in Dalston-lane. Two walls were being built in the front, with a space of 4ft. 9in. between them. Bricklayers were at work on a scaffolding at the top, there was no guard-board to the scaffolding, and, in consequence, about half a brick came off the scaffolding, struck him on the back of the head, inflicting a severe wound, which had since rendered him incapable of working. He had been an out-patient at St. Bartholomew's since April the 5th, suffered from slight deafness, pains in the head, and, since the accident, had not been able to "collects his thoughts properly." Mr. Ruegg: A great many of us cannot do that. (Laughter.) Defendant's was that it was a pure accident; that if there was negligence, it was on the part of plaintiff, who ought not to have been in the area at the time. Defendant paid plaintiff his full wages for six weeks afterwards, and up to the time of his receiving a solicitor's letter from him. His Honour said Mr. Anley had behaved in a very handsome manner under the circumstances; still, a guard board might have been put up, and the plaintiff stood upon his legal rights, and he should give him a verdict for £21, with costs.

ACTION FOR SLANDER.—ONE FARTHING DAMAGES.—BRASS v. HOLLINGTON.—The plaintiff, Mr. William Brass, a builder, carrying on business as William Brass and Son, formerly of Old-street, St. Luke's, but now at Page-street, Westminster, sued Mr. Alfred Hollington, County Councillor and Common Councillor of the City of London, of the firm of Hollington Bros., clothiers, of Middlesex-street, Aldgate, to recover damages for alleged slander. The plaintiff's case was that in October last year the manager of a company which fixed lifts and machinery, in the course of some negotiations with the defendant as to the fixing of a lift upon his premises, mentioned that his company had fixed a lift for Mr. Brass, and thereupon defendant said that plaintiff was a bankrupt, and had lost all his money in gambling on the Stock Exchange.—The defence was a positive denial that defendant had ever uttered the words complained of.—The jury, after a short deliberation, returned a verdict for the plaintiff, with one farthing damages.—Judgment accordingly. Mr. David applied that the plaintiff should be deprived of costs. The Lord Chief Justice said he would consider the question, and, replying to Mr. Bowen, he promised also to consider whether he would give a certificate for a special jury.

WATER SUPPLY AND SANITARY MATTERS.

BRIDGEND.—Major-General C. Phipps Carey, R.E., held an inquiry at the Town Hall, Bridgend, Glamorganshire, on Wednesday, the 27th ult., into an application made to the Local Government Board by the urban authority of the Bridgend local board and the rural authority of the Bridgend and Cowbridge union to borrow £9,000 and £7,000 respectively for works of sewerage. The main outfall from the town of Bridgend to the sands, the site selected for treatment of the sewage, is about 2¾ miles in length, the cost of which will be borne by the above-named authorities in proportions already agreed upon. The towns of Tondu and Aberkenfig, and the districts adjoining them, will be efficiently drained. Mr. George Fenton Lambert and Mr. J. C. Rees, the engineers of the scheme, went fully into the technical details of the scheme, and explained the plans which they had prepared. It is estimated to meet the requirements of about 10,000 people. The inquiry lasted some hours, and Mr. Lambert was examined by some of the persons present as to the existing state of the town drainage and as to the method of ventilation he proposed to adopt in the new scheme, and his replies were considered very satisfactory. The inspector afterwards inspected the site of proposed outfall and line of sewer, also the district above Bridgend—viz., Tondu and Aberkenfig—thus taking a great deal of time and pains throughout the inquiry, which lasted from 11 a.m. until 6 p.m. There was no opposition to the scheme.

St. Peter's Church, Duddon, near Tarvin, has been restored, a new heating apparatus has been laid, a vestry and porch have been added to the building, the flooring has been rearranged, new seats have been provided, and the church has been painted and generally beautified at a total cost of £350.

Our Office Table.

SIR FREDERIC LEIGHTON appeals for £3,000 wherewith to complete the Wellington Memorial in St. Paul's. He says:—"The monument has been transferred to its proper position and surroundings; it now awaits completion, and it is in this necessary work that I would ask the co-operation of such of your readers as are careful of a supreme artist's fame. The original design of the sculptor—which may be seen at present by the side of the unfinished monument—shows an equestrian statue of the great Duke occupying the now vacant pedestal which surmounts the whole, and worthily crowning the magnificent conception. Of this statue a rough unfinished model from his hand is in existence, and will, if made accessible, serve as a sufficient guide to the artist who shall be privileged finally to carry out this portion of the cenotaph; that artist should be a man whose genius will carry him worthily through such a task, and whose reverence for the name of Alfred Stevens will insure that close adherence to the leading lines and features of the first design which the public voice would justly demand; such a man, both in his gifts and in his reverence, the Dean and Chapter of St. Paul's have seen in Mr. Alfred Gilbert, R.A., whose selection for so noble a task will command, I cannot doubt, universal approval. It now remains to us to seek the necessary sum wherewith to defray this final expenditure—a sum estimated at £3,000."

A PUBLIC meeting, convened by the City Church Preservation Society, was held last Friday at the Mansion House, in furtherance of a movement to protect churches from destruction. Dr. Freshfield moved:—"That this meeting, while favourable to a much-needed reform in the ecclesiastical arrangements of the City, is of opinion that any further destruction of churches and desecration of sites is to be deplored, and must be strenuously resisted." Professor Shuttleworth, Rector of St. Nicholas Cole Abbey, seconded the resolution. In his opinion the time had arrived when a strenuous protest should be made against the destruction of edifices which owed their origin to the genius of Sir Christopher Wren. There were many reasons why City churches should be preserved. He claimed for them that on antiquarian, architectural, archæological, and practical grounds churches within the City boundary ought not to be demolished. The resolution was declared carried. Mr W. Neave Hill moved: "That this meeting, having in view the great historical interest, as well as the practical value, of the Church of St. Ethelburga, Bishopsgate, deeply regrets that an attempt is now being made to bring about its destruction, and pledges itself to use every means in its power to avert so deplorable a result." The resolution was passed unanimously.

THE Hybrid Committee of the House of Commons, appointed to inquire into the merits of the London Streets and Buildings Bill, have brought their labours to a conclusion, and after a prolonged inquiry, the Bill was ordered to be reported to the House. As now passed, the Bill embodies all existing legislation relating to London streets and buildings, with such amendments as sanitary science has proved necessary. The buildings which have been exempted from the operation of this Bill are the existing schools of the London School Board, those owned by the four Inns of Court, and all buildings used solely for railway purposes.

A REPORT on the dust destructor at Kensal Town, by Mr. T. W. E. Higgens, A.M.I.C.E., surveyor of the vestry of Chelsea, is of interest to local authorities. Mr. Higgens describes the several schemes submitted by Messrs. Horsfall, the Municipal Appliance Co., Messrs. Manlove, Alliott, and Co., and Livet's British Steam Generator Co., and the estimates of these. He suggests that the scheme of the Muncipal Appliance Co. be adopted, if it is thought advisable to erect a destructor on sanitary grounds, and to utilise the heat for the baths. This way of utilising the heat is thought the best. The scheme would cost £4,895. This plan would be adopted by the vestry in conjunction with the Baths Commissioners; there would be four cells (half-sunk), and a chimney 150ft. high. If the vestry desire to erect a destructor (without the baths), and utilise the heat for lighting the offices and destructor buildings, Messrs. Horsfall's scheme is proposed, with the addition of a chimney 120ft. high. Mr. Higgens does not believe in the popular cry that London can be lit by electric light for nothing by its dustbin refuse.

THE annual exhibition of work executed by the scholars and pupil-teachers in the London Board Schools will be held at the Hugh Myddelton School, St. James-walk, Clerkenwell (near the Farringdon-road station), on Friday, Saturday, Monday, Tuesday, and Wednesday, July 20, 21, 23, 24, and 25. The exhibits will include various branches of drawing, shading, designing, outline from plants, casts and models, and modelling in clay; designing in coloured paper, cardboard-work, woodwork, needlework, cookery and laundry-work, and kindergarten.

FAMBRINI & DANIELS,
MANUFACTURERS OF IMPERISHABLE CONCRETE MASONRY FOR
CORNICES, STRING-COURSES, MODELLED PANELS,
AND EVERY STONE-WORK REQUISITE.
LANDINGS and **Plain** or **Moulded** and **Mitred STEPS**, durable throughout.
NO SPECIAL FACE REQUIRED.

FRIDAY, JULY 20, 1894.

REPLICAS.

IT is a fortunate thing for architecture, and those who follow the profession of designing buildings, that sites, conditions, aspects, requirements, and other circumstances vary as much as they do, for if they did not, we take it it would be a very serious thing for architects. We could imagine the municipal building assuming more or less the same arrangement of plan if the site was always a rectangle and the main streets in the same position, the public library or polytechnic institute to be repeated in its general design, and, in fact, every sort of building would more or less follow a model or type in the course of time, from the sheer uselessness of trying to improve on the previous attempt. The general tendency to fall into a groove of thought is seen in buildings of a commonplace kind, as the ordinary dwelling-house, or the residential block and workman's cottage, wherever the conditions do not vary much. The ordinary builder likes to minimise divergences. Repetition approves itself to the public mind; people get accustomed to a certain order in their houses—a particular position of the entrance and stairs—and get attached to a particular kind of exterior; and when this is the case, the demand for a certain kind of residence is sure to be met. And it is the demand for buildings of a certain type that creates the speculative builder. He multiplies accordingly hundreds—aye, thousands — of a dwelling which satisfies everybody, and which may be seen in every suburb by the mile. One is annoyed at this wearisome repetition of the street dwelling. Why should street after street be monopolised by a miserable multiplication of one unit —the irrepressible porch and bay window, and flat, unbroken roof which everybody is content to dwell in? The answer is, Because the builder has found out a dwelling that satisfies the mass of the people, and rather than entail extra expense, has multiplied it wholesale. One sees, it is true, an attempt in some of the West-end suburbs to mitigate the evil of repetition by changing the elevation. The changes are rung by differences of gable and bay and other features, but the plan is very little altered. In a few of our roads we see a row of new shops built in red brick, all having ornamental gables, a little variety being given by alternating the terracotta ornament; but a row of equal-sized gables is almost as monotonous as a row of roofs of the same height and description. There is really no more excuse for making a number of street houses the same in plan and elevation, than there is in expecting every person who lives in a street to wear the same style and colour of garments, &c., or to conform to the same habits of life. The idea of uniformity is simply an economical mode of building, and is done to save labour and cost. One design can be repeated, and the architect's commission saved. The leaseholder of the land, who wishes to make large profits, benefits by the arrangement at the cost of the tenants. These are the only reasons for repeating a plan which, though fairly comfortable, is not the best in every situation. A monopoly would be made of all building if opportunity permitted—wherever, in fact, money could be made by repetition. What is it that makes so many of our West-end streets and squares so dismal and depressing, but this monopoly of the large building speculator of former days? We have only to look at Belgravia and Bloomsbury to see the result of building by the mile, street upon street, and square upon square of houses practically the same. But what the late Thomas Cubitt did in the building of Belgrave and Eaton squares was a boon, as he converted an unhealthy, clayey swamp, known as "The Five Fields" in 1824, and once the terror of foot-passengers, into one of the most healthy neighbourhoods. Far less can be said for the modern mania of multiplying one-plan dwellings. They cannot compare with the structures reared by Cubitt, such as those which are to be found in any of the above localities, or in Tavistock, Woburn, or Bedford-squares, and adjoining streets. These are at least substantially and well built; the modern ground landlords and their tools are content to put up flimsy imitations without the aid of the architect. Men like George Basevi, Hardwick, and Kendall were employed to design the houses and squares of those parts; but, except in a few favoured neighbourhoods, the architect is not now called into requisition. The result is a class of stereotyped building which has scarcely any claim as architecture. The great shortcoming of the street house built on this plan is that no variety is shown to suit different individual wants and circumstances. Every house is exactly like its neighbour, of the same size, and with the same number of rooms. A man with a large family has precisely the same number of rooms as the tenant without a family. It is extraordinary so little foresight is exhibited in new buildings — that the builder does not see that a little variety of accommodation, say two or three different arrangements and sizes of rooms, would be far more likely to let than a row of houses of precisely the same pattern. When will builders, and architects, too, believe in the diversity of human nature, its many idiosyncrasies and motives; that there are no two men or women alike, either in mind, inclination, or stature, and try and conform their buildings to their wants? Instead of which, there are some men who are always trying to make people believe and do as they themselves; who are always laying down a hard-and-fast rule, in politics, religion, amusements, and teaching, as in everything else; who are never so happy as when they are attempting to enforce a Procrustean law upon everybody or thing, without seeing that human nature is infinitely varied, and will never submit to be forced into a certain mould without unhappy consequences. Least of all is it possible to make everyone's taste the same, or to adopt a single model of house to suit everybody. Architecture has always developed from differences of climate, habit, and thought, and unless we make our buildings conform to this great law of differentiation, we must not wonder if they assume more and more the form of replicas fatal to truthful design, but just in that proportion remunerative to the builder who trades on the stereotyped plan. This replication of design is observed mainly in our street and domestic architecture, for it is this branch that the ordinary builder has made his own. The repetition of parts of plan and detail saves labour, enables the speculator to put up a hundred houses at a saving of quite 30 per cent., enables him to get his joinery sent in ship-loads from Sweden and other foreign ports, and to engage unskilled labour to a large extent. A hundred windows or doors of the same description are infinitely more to the interest of the builder, than the satisfaction of obliging the vendee or tenant by varying the size and shape of his rooms. By repeating the same detail, it is easy to find out how to make the most of a given quantity of material. For instance, two stone door-heads may be cut out of a block of stone; a circular shaft can be sawn in two, each half serving as a pilaster; two capitals or keystones be cut out of one block, and so on. Our commercial buildings do not follow this replication to the same degree as residential buildings; but there are signs in many of our new premises of the same repetition, especially when an opening occurs for a builder to erect a row of new shops. In Piccadilly or Oxford-street opportunities do not often occur for a considerable frontage of old premises to be rebuilt, and therefore the architect has a chance of being employed when single premises are dealt with. It would be lamentable to think what would be the fate if such streets as these were entirely rebuilt. Who would not prefer to see our Cheapside, Fleet-street and Strand as they are, than lined by buildings on the replica system? We can now distinguish differences of trade and business in many of our old thoroughfares—the quiet and steady tradesmen from the noisy, pushing advertiser; the wholesale from the retail shop; the bank from the newspaper office; the hotel from the restaurant or buffet. These dissimilarities of object find expression in the external architecture, and in the plan; and we have, therefore, variety of the old and new to regale the eye. The modern system is to stereotype, to reduce the differences into a few types, and to get these manufactured as cheaply as possible. There is very "much of a muchness" about many new buildings that have been erected in recently-developed neighbourhoods—a repetition of shopfronts, windows, and gables, as if the architect's design had been repeated with few variations. The building-owner knows how to do without a professional architect. He employs an architect to design a new shop, which is executed at the usual commission; the other plots are let to a builder, who follows the same design. A flat, tasteless front of red brick and panel ornament is copied again and again. The tenant who desires any alteration can have it done after the outer carcase is finished, and in several cases of recently-built shops and business premises this plan of putting up a number of fronts with mere skeletons of timber behind is resorted to, any "particular arrangements to suit tenants" being boldly stated on a board outside.

A true and genuine architecture can only be developed by accentuation of differences—just those points, in fact, which the mere builder dislikes. These may be taken under such general heads as (1) aspect, (2) surroundings, (3) requirements, (4) individual habits, which things are ignored by the specious builder. It is for the architect to prove the advantages of his craft or profession by making his designs embodiments of these conditions. The more he does so the greater will be the public estimate of his services; whereas by ignoring them, he allows the builder to take advantage of his position. In domestic building few things betray the want of a studied plan more than placing the main rooms and windows in the wrong position, as regards sunlight and prospect. The architect is careful about placing them on the most desirable side for prospect, even if the symmetry of his elevation is spoilt thereby. The doorway need certainly not be central, as our friend the builder generally puts it, but in the most convenient position for access from the main streets, and the style of the surrounding buildings is consulted. Again, the "up-to-date" designer works from his plan outwards; he looks upon it as something rather to be exhibited than concealed, a principle which the popular mind has not been quite able to understand, and probably will not so long as the public prefer outside appearance or elevations to real comfort and convenience. So long as the ready-made or "slop shop" garment idea prevails in building matters, we shall get houses built for the million without the least reference to individual wants. Ought we not rather to see dwellings made for individuals suitable to their tastes and habits in life? To accentuate these various conditions, not to minimise them—to try and make the most of environment, of aspect, of the requirements of the building, are the chief means by which the architect can prove both the vitality of his art and the fertility of his own resources, and are the only ways of lifting design from that dead-level to which the builder and the copyist have brought it in some branches by the process of repetition.

ARCHITECT'S CERTIFICATE: ITS BINDING NATURE.

CAN a building committee restrain a contractor from suing on a certificate which has been given by the architect who is alleged to have exercised his duty in a partial and biased manner, or can they check the architect from certifying for a much larger amount than actually due to the contractor? The recent case of "Stanton v. Straub," in the Equity Court of New South Wales, is of much interest as showing the legal view, and we may briefly refer to the material facts as they are given in the judgment of Mr. Justice Owen in March last. An interlocutory application was made for an injunction to restrain the defendant, the contractor for the Anglican Cathedral at Newcastle, from proceeding with an action against the building committee. The defendant sued the committee for a sum of £3,762, certified by Mr. Horbury Hunt, the architect. It was alleged in the pleadings by the plaintiffs, the Bishop of Newcastle, N.S.W., and the dean, that the architect was unfit to exercise the duties of architect in an impartial and unbiased manner, and that he had been guilty of charging a much larger amount to the committee than the amount actually due to Straub, and that, out of anger for not having the honour of finishing the building, he had increased the certificate to a large amount; and, therefore, it was pleaded the Court ought to interfere to restrain the contractor from suing on that certificate. Here was a charge of misconduct and incapacity against the architect which, if it could be substantiated, was a ground for setting aside the certificate. The plaintiffs pleaded collusion between architect and contractor, inasmuch as they allege the latter knew that such certificate was given *malâ fide.* The judge said, "This is a distinct charge of fraud against both contractor and architect, and it appears to me that I ought not to deal with this case merely on a question of pleading where a charge of that kind has been made, but that I ought to express my opinion of the merits as disclosed in the affidavits. Whatever may be said of the argument that Mr. Hunt acted improperly under feelings of irritation and anger, the question of the Court is: What are the facts which are proved? Mr. Hunt has produced affidavits of eleven architects and contractors, all of them men of high standing—Mr. Mansfield, Mr. Rowe, Mr. Wardell, &c.—and a great number of contractors, and every one of them says the certificate is absolutely fair. These eleven witnesses swear that the certificate given by Mr. Hunt for the work is perfectly fair and justified." On the other side there was only the evidence of one contractor. The judge further observed that the certificate was not a final one, but a mere "progress certificate," and, according to the law and evidence, they are nothing more than "advance notes," and are subject to adjustment from time to time. He ruled that the certificate given by the architect was a progress certificate, and did not purport to be absolutely correct. Under these circumstances, he thought that the whole ground was cut from under plaintiffs' feet. If the certificate is a *bonâ fide* and fair estimate of the amount of work then done, what becomes of the theory that Mr. Hunt may have been biased? Upon these grounds the judge dismissed the application, with costs. Whatever ill-feeling existed between the architect and members of the committee, it had not influenced Mr. Hunt to give an improper certificate. Since this decision, we believe the building committee and Mr. Horbury Hunt have come to a friendly understanding, and the work has been resumed under his direction.

The decision places the relation of the architect and building committee or owner in reference to the question of certificates in a clear light. The plea of collusion between architect and contractor is a legal one, and has in some instances carried weight, as when it can be proved there is justifiable ground for an action. In this instance, as well as in others, it failed, and it is at least a warning to building owners generally to be more careful before they bring charges of this sort against their architect. It is very improbable that any architect of position would be guilty of misconduct of the sort imputed—in other words, of having certified for a larger amount than the builder was entitled to. If such charges of bias or fraud were allowed to go unchallenged, every progress certificate made in the ordinary course would be questioned, and a very undesirable precedent established. Whenever an owner or committee thought the amount was in excess of what was due, however ill-founded their opinion might be, they would try to repudiate the certificate of the architect, and serious interruptions would take place if clients could allege bias or collusion on the part of their architect and contractor. These charges of bias practically take away from the architect his right to arbitrate on matters of this kind, and places in the hands of any litigious owner or building committee a right to interfere when any certificate is given.

The distinction between interim or progress certificates and final certificates ought to be understood; the former are more or less approximate, and are merely advance notes, while the latter are binding and conditions precedent to payment. The latter bind both parties, the contractor as well as owner. The owner cannot go behind it, and in the absence of proof of fraud or collusion he is bound to pay the amount stated, even should the architect make a mistake. The decision in "Goodyear v. Mayor of Weymouth" is conclusive on this point. One case which bears more directly on the decision of the Equity Court in New South Wales is that of "Laidlaw v. the Hastings Pier Company," where the plaintiff contractors sued the company for the balance of money due to them, shown by the engineer's final certificate. The defendant company resisted the claim on the ground, amongst other things, that the engineer had allowed for works claimed for as extras by the plaintiffs, but which had not been duly authorised. The decision was in favour of the plaintiffs. The engineer, it was decided, had power to extend the time of completion, and the certificate precluded the defendants from raising the question whether extras had been done. The judgment of Lord Chief Justice Coleridge is an exhaustive and conclusive decision as to the binding nature of an engineer's certificate when the contract gives him power to decide in all matters of dispute between the parties. In the New South Wales case the certificate was simply a progress certificate, and did not claim to be absolutely correct, and therefore it was not in the power of the building committee to question their architect on an amount that was subject to adjustment at the final certificate.

THEATRES.—XXXIX.

By Ernest A. E. Woodrow, A.R.I.B.A.

A GREAT deal remains to be done in order to add to the comfort of the pit and gallery seats as at present found in many theatres; the bard wooden form cannot commend itself as the most desirable place to occupy for four hours at a stretch; stuffed seats, however, are not good in these parts of the theatre, where the people who frequent them are not always as careful as they might be, and where the wear and tear is very great. A hard surface, that can be constantly washed, is certainly desirable; the coverings of leather and cloth sometimes used are not altogether satisfactory, as the one does not stands the wear and the other holds the dust. In one or more of the London theatres the pit is seated with very comfortable bent-wood benches, which appear most suitable for the purpose; they are clean, cool, and easy.

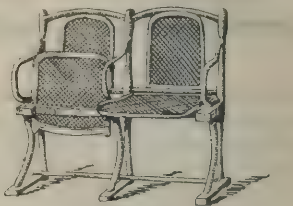

Fig. 1.

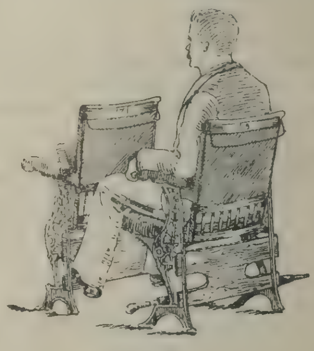

Fig. 2.

Tip-up bent-wood chairs are made for theatres, and Fig. 1 is an illustration of a seat suitable for the upper circle. The upper parts of a theatre are frequently much warmer to sit in than the lower, on account of the rising heat from the gas and bodies below. The consequence is that a stuffed and velvet-covered chair is often anything but comfortable or desirable for those occupying seats at a height above the ground-floor level. The confined space between the floor and ceilings of an upper tier also tends to make the heat oppressive, and a cool seat is, therefore, one to be wished for.

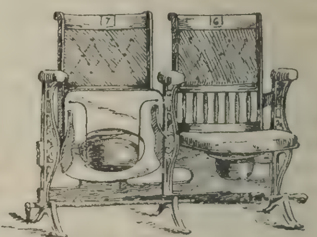

Fig. 3.

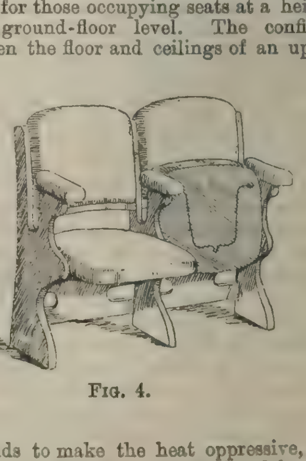

Fig. 4.

In Figs. 2, 3, and 4 are illustrated different forms of tip-up seated chairs, where the convenience of the audience is thought of, for in them it will be found that a place has been made to lodge the umbrella, a rest given for the feet, and a receptacle for the hat below the seat and the overcoat at the back.

The finishing and fittings of seats for music-halls, where drinking and smoking are permitted in the auditorium, call for a ledge at the back of the seats to hold glasses, matches, and ash-trays; otherwise the seats may be of similar arrangements to those in an ordinary theatre.

Spring seats or automatic flap seats in intermediate gangways must never be allowed; no half-measures should ever be allowed. It is advisable, where the width between the rows from back to back is small, to have the ordinary seats of the chairs rise automatically with a spring or weight.

There is, however, a legitimate use for spring seats in theatres. Checktakers, who collect tickets and give "pass-out" checks during the evening, often have to stand at their post for four or five hours at a time; this is almost too much to expect of any man, and at odd times when they are not watched they are apt to take a loose chair, box, or anything that is handy to obtain a resting-place. This chair is then placed in some passage-way or on some staircase where the public have to pass, and should persons leave the auditorium in a rush or panic, it is more than likely that someone would stumble over the chair and fall, and that others would fall over the prostrate body. It is in this way that the frightful crushes occur on staircases, and theatre panics are attended with such dire disaster. It will be remembered that the fatal crush on the gallery staircase of one of the theatre fires which have occurred in this country in recent years was started by one man falling over a small box placed at the top of the staircase, in which the tickets were placed as they were collected. To avoid this, these ticket boxes should be let into the thickness of the walls without any projection. In the same way the architect can provide for the comfort of the checktaker and safety of the audience by having fitted at such points where the manager requires checktakers to be stationed, flap-seats, counter-balanced to rise automatically flush with the wall, when the occupant of the seat gets up.

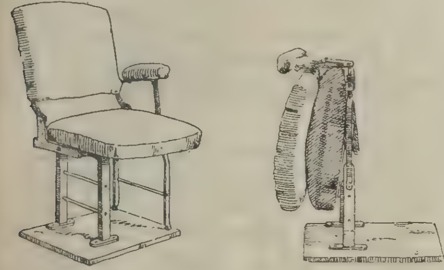

Fig. 5.

Several patent contrivances have from time to time been brought out for folding up the chair and reducing the space occupied by theatre seats. These contrivances have not found favour with manager or architect; in some cases on account of the prohibitive cost, in others on account of the complexity of the arrangement. I have not, therefore, seen any of the seats which I now give sketches of in actual use in a place of public entertainment. I give the diagrams, however, as matters of interest, showing that efforts are being made to obtain some advancement in theatre seating; whether those efforts have yet resulted in improvements has not yet been determined.

Fig. 5 is a chair invented by Mr. Farini. The sketch explains how the back is pulled down on to the seat, and the whole then tipped over one side. The object is, of course, to form gangways at right angles as well as parallel with the stage. The arrangement is not automatic, and it is very doubtful if any uninitiated occupier of the seat would know how to fold it up. The same firm make the patent chair shown in Figs. 6 and 7. Here, as will be seen, the back is hinged like a door to a post on one side; by pulling the back towards you round to the arm, the seat, which is counterweighted at one end, rises; the seat and back being then packed up to the side of the arm, and give gangways at right angles between each seat.

Fig. 8 is a German invention; the seat rises automatically when vacated, and the back falls simultaneously. I had hoped to add other foreign and Continental inventions to this list, but up to the present I have been unable to obtain the illustrations. Other patents, no doubt, exist, which may or may not be an advancement on those which I have illustrated.

All seats must be fixed to the floor to prevent them being overturned and becoming stumbling-blocks. Loose chairs, additional seats or camp-stools are never allowed in rightly-managed theatres; where they are seen they are signs of greed and disregard for the safety of the public on the part of the manager.

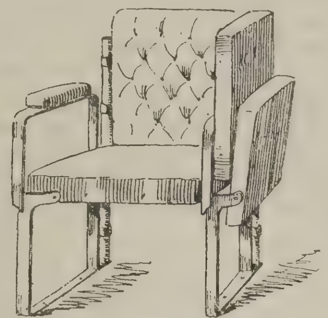

Fig. 6.

In order to minimise the inflammable contents of a theatre, it is, perhaps, well, where possible, to have the frames of the seats made of iron, instead of wood. From an artistic standpoint the coverings of the chairs should harmonise with the decorations of the house, for it must be remembered that they form a large mass of colour, especially on the floor of the house.

There is one small matter which it would be, perhaps, well to remind the architect that he must not overlook. In most theatres the number of seats in the stalls varies with the popularity of the play. As the managers object to see and the actors object to play to empty stalls; the number of seats in the stalls is reduced when a play flags and increased when the booking is large. To meet the exigencies of this case, the front rows are removed; but when more seats are required the pit has to suffer, and the barrier dividing the pit and the stalls is moved back and the space filled up with stall seats. The alteration in the width between the rows means a fresh fixing on the floors, and, where concrete floors are laid, the architect must allow for the distances on the floor in this space for both pit seats and stall seats, and also make provision for the refixing of the dwarf partition between the pit and the stalls.

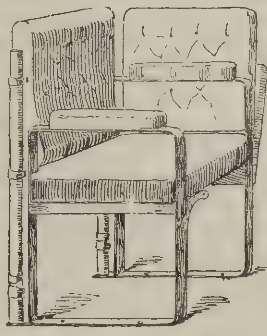

Fig. 7.

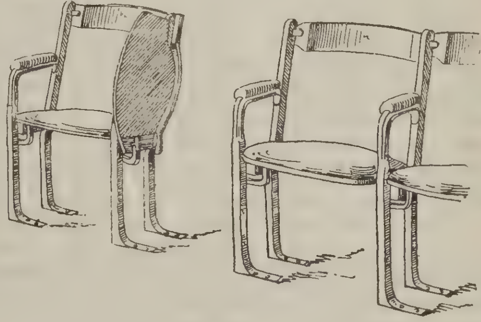

Fig. 8.

As the occupants of the seats on the floor of the house have to look up to the stage, the inclination of the backs of the seats in the pit and the stalls should be more than that of those in the parts of the house where the audience look down on to the scenes.

"BUILDING NEWS" DESIGNING CLUB.

A PAIR OF LABOURERS' COTTAGES.

THIS is the eighth and last subject given for this season's Club work, and we illustrate the two chosen designs to-day. The seventh subject, a Cocoa Tavern, is held over because of the pressure on our lithographic space just at the present moment, and as we have devoted two plates to the illustration of the selected plans for that subject, their publication must wait for a week or two longer. To avoid delay, however, with the designs for Cottages, we have reproduced them by the block process herewith. The following is a copy of the instructions issued for competitors:—"H.—A pair of Labourers' Cottages, to be built in stone, covered with rough-cast plaster, and roofed with slates, suitable for a hillside country. The accommodation to comprise a living-room 14ft. by 12ft., a suitable kitchen and scullery combined, and a roomy larder. Three bedrooms upstairs. Adjacent a washhouse, about 15ft. by 10ft., common to both cottages, is to be provided, with oven and copper; also furnish two earth closets and a pair of pigsties. Over this building a loft, divided into two, is to be arranged for storage of roots, and to be reached by a permanent wooden step-ladder with handrail. Economy and simplicity to be rigidly observed, coupled with convenience, adapted to workpeople's requirements. Scale, 8ft. to the inch. A set of drawings, including a good view." The foremost designs were very equal in point of merit, and we had no little difficulty in determining which should obtain the leading places. "Nitor" comes first, "Boomerang" secures the second position, and "Scottana" ranks third. The absence of a break in the plan last named is a great point overlooked by both the other designs, neither of which is as simple as it might with advantage have been. "Nitor" keeps clear of ornamentation rightly enough, and his rooms are square and well contrived, though it is not certain whether the kitchen and living-room should not open one out of the other, and so avoid all semblance to anything like a villa type of dwelling. The staircase runs the doorway at the entrance uncommonly hard, and the third bedroom is not any too large. The roof is not exactly a cheap one, hipped as it is and broken into by the dormers. The chimney runs up through the centre of the block, and the treatment of the cottages externally is decidedly pretty, even if it does not betoken the rugged simplicity and stern outline which would look at home in a stone-scattered hillside district. "Boomerang" in some ways treats his houses more in accord with the requirements of a cottager's wants, though the bay windows and gables would run into money. The washhouse, too, is not so good in this design, the head room in the upstairs rooms is more limited, and the little landing is uncomfortably small. "Scottana's" elevations seem more suitable in their bald, primitive picturesqueness, one roof running from end to end of the block and mansard-like handled gables. The first slopes, starting from the first-floor level, however, seriously curtail the bedroom areas. The bedrooms are also cut up on plan, and the fireplaces are not so well contrived for inexpensiveness and stability. The author, however, avoids anything like the bothersome little slip of tiling which occurs along the façade of "Boomerang's" design over the bay windows. So small a piece of tiled surface as this would be needlessly expensive to execute, and likely to get out of order. "Kelso" sends a good plan and simple elevation, having the merit of quietness and suitability, though the bedrooms are also cut down too much by the roof slopes, of which an undue feature is made. "Ant" errs still more in this respect, spanning his two houses both ways with big and tall gables. The effect is eminently picturesque, of course, and the planning is fairly good. The washhouse, common to both cottages, was, however, not intended to be thus incorporated in the cottage building itself, as a reference to the instructions will show. "Diomed" contributes a more ordinary gabled front following a familiar type enough, which always looks well with long, low windows, and plain barge-boards to the gables. The plan is not a convenient one, with the ugly lobby off the stairs. "Cyclist" puts his doorways at the sides, and makes a feature in an unpretentious way, with mullioned windows placed at the external angles of his living-rooms. His plan is a good one, speaking generally, and his elevations show a great improvement upon much of his previous work. The roof would be expensive for such a class of building as a labourer's cottage. "Black Griffin," in a sort of Yorkshire-like style, employs sprawling curved-shaped dormer gables with a flat pitch for the main roof of the houses. The wash and bakehouse would have been better placed more away from the cottages, and the loft should have been shown over. The plan, otherwise, is quite one of the best. So many fail because they assume too much the character of middle-class homes, while some are treated like ornate lodges or villas. "Youngster" is one of these, sending a plan which is at once expensive and inconvenient. "Swan," too, is another contributor who takes cost to be a matter of no moment, and consequently he fails, in spite of his neatness and care, which we have duly noted. "Waterloo" makes it necessary to pass through the living-room to reach the staircase—an unobjectionable provision if all the parts of the house corresponded, which is by no means the case in this instance, conceived as it is on the villa type. "L'inconnu" plans well, makes the most of space, and sends in a pretty design which is diversified by alternating the façade and front entrances. We hardly like the end gables, and the cost would not be economical. The bedrooms spoil these houses. "Betterment" is just as coarse in his drawing as the last-named competitor is too fine. This design is a long way behind the other, though the three plastered gables over the front are quaint-looking, masking the windows below. "Q. E. F." gives us a timbered gabled block nicely managed, and the living-rooms are really worthy of the name. The bedrooms are good, too, but the style adopted does not, in our opinion, seem suitable for the purpose. "May" draws very poorly, and his design is not very original or strikingly good. The enriched porch is quite out of place. "Schemer" incorporates his washhouse in the main block, which is spoiled by shockingly poor bedrooms, only 7ft. and 6ft. 6in. wide. "Nil Desperandum" is clever in a way, and strikes out after originality with some success, though we cannot say his design looks much like a pair of labourers' cottages, and we cannot admire his drawings. The lettering goes far to spoil them. "Seer" comes next with a poor design, and plans which waste space in passages. "Ivy" is neat, and with a knowing sort of air plans the stairway out of the living-room. This design is rendered impossible for our purpose by its dark landing and wretched bedrooms, without going into matters more in detail. "Photographer" might be more at home with the camera. His plans are not a success, in spite of the splendid arched recess for a garden seat in front of the cottages, which seems to have governed all else. "H. I. G. S." sends a pair of villas, and poor at that. "Gargoyle" contributes a design which is severe enough, and ugly. This we should not mind if his plans were convenient, which they are not. "Dessinateur" fails to understand the problem, and has done his best to ape a style more adapted for suburban retreats, where city clerks rejoice in semi-detachments. "Petrel" breaks the rules as to the size of the paper he uses for his poor plans and scribbly drawings. "Lily" should take a few lessons in perspective. His elevations are very simple, for which we give good credit.

OF CHURCH EMBROIDERY.—XI.

By MAY MORRIS.

ANIMALS AND SYMBOLS.

[WITH LITHOGRAPHIC ILLUSTRATIONS.]

IN my last appearance in the BUILDING NEWS, from whose pages I have been so long absent, I had a few words to say about design. They were, indeed, very few, very scant, and impoverished, and by no means worthy of the dignity of my theme. But on glancing over what I said then, I am reminded of a host of pretty and interesting things to talk about, and should less easily tire of writing them down than you would of reading. I have been a wanderer on the face of the earth of late, and fate or inclination took me to many queer old towns, as dead as ditchwater as regards modern arts and industries, and living merely on their past reputation. Personally I prefer London, as less humiliating to the humble decorative artist trying to do his honest best. On the whole, a November morning in Hammersmith is more inspiring than a glorious June sunset over the Italian mountains seen through a network of sturdy figleaves and clustered vinebowers. Work! Why should one? The Italian peasant may rise before dawn and labour on through the burning day till after twilight (indeed, I know he does); but he and I live from day to day, indolently careless about to-morrow, and I listen to his strange rhythmic chant in the ricefields, and watch the girls and boys in the cherry-trees, making love as they tear off great branches laden with fruit, and I laugh with a contempt that is perfectly unseemly to think of all you people in London, in the height of the season, working and playing and voting and, generally speaking, keeping the world going. But, having come back to London and to a decent and respectable frame of mind, I find there is literally nothing to tempt one into looking out of the window, and I feel a certain sedate satisfaction in keeping hard at work—either writing or making a mosaic of colour with silks and shining gold. The inspiration of despair! I commend this apology for dulness and squalor and the coming November fogs to your attention. I am really not so far off the subject of design and the rest of it as would appear, for the passage in my last article that struck me had some reference to animal life in design, and I have come back literally steeped in the influence of Early Christian art, in which birds and beasts play a very large part indeed.

Though I should like to insist again on the fact that there never was formerly the hard-and-fast line between secular and religious ornamental art that we have to-day, there always were certain recognised symbols used for shortly telling the stories and legends grown up round the Christian religion. How many of such emblems and symbols were unconsciously adopted from earlier religious beliefs it is not in my province to discuss here. The myth that grew up round the world-old ritual, explaining the same by some legends of the doings of a heroic or supernatural being, occurs no less in the Christian than in polytheistic beliefs, and the study of symbolism brings one face to face with anthropological problems of the deepest interest. It would be strange if different tribes and nations of simple life, always face to face with the struggle with Nature, should not invent similar means of expressing their similar beliefs in the supernatural powers of Nature herself, beliefs which personified the life-giving sun, the trees and plants, the beasts and birds around, worshipping the principle of Life under some strange form or other, and jumbling up the Godhead with his attributes, or his symbols, or his sacrificial victim.

Thus we are not surprised to find the most occult signs and emblems of a far-away nature-worship occurring in the Christian faith of modern civilisation, the significance given to them by religious teachers sometimes being far removed from their origin, and sometimes directly or indirectly resembling it. Byzantine art at Ravenna, and at Venice, is notably full, not only of symbolic animal-life, but of animals merely beautifully and delightfully decorative. In the marvellous dome-mosaic of St. Appollinare in Classe fuori, a few miles out of the city of Ravenna, the first thing that struck my eye, after the first feeling of bewildered delight at the radiance of gold and colour, was the procession of animals spotted all over the brilliant green of that earthly paradise of the old masters in mosaic. Just imagine a border of white lambs and lilies alternately, bounding in the mass of the green world, all beflowered and planted with fruitful trees; and then imagine the great globe of Heaven in the centre, intensely blue and sprinkled with gold stars and surrounded by a jewelled border; imagine this hanging in luminous gold flecked with clouds, from which the hand of the unseen Deity is stretched, threatening, soothing, blessing and dooming worshipping humanity. A strange splendour to come upon in that empty, deserted building, that stands out in the solitary marsh, with its sunken pavements and pillar-bases lost in the soft, treacherous soil! The symbols of the Evangelists—the Man, the Bull, the Lion, and the Eagle—presenting the books of their gospels, are over the dome, winged and haloed, and vaguely rising above the clouds. I have seen nothing more beautiful than this simple scheme of design. In it, by the bye, the animals are entirely dignified and devotional—on their good behaviour, as it were; whereas sometimes we meet with them playful and a little wicked, full of humour and light grace. Such as the illustration of my present paper, in which the little dog, in a very life-like attitude, is barking at the pelican or stork seated on her nest in a shady island, the mother-bird hissing at the mischievous creature, and an eagle above ready to swoop upon the young birds as soon as she can be driven off the nest. Quite a drama of the open air. In another very handsome piece of brocade, which I should dearly have liked to reproduce, a lady is at a fountain drawing water in a bucket, with two rabbits slung on a wand over her shoulder, and holding a leash of dogs, two spotted and two plain, who lap water in the pond below the fountain. She has been hunting in the oak-forest, symbolised by one delightfully-designed oak-tree with very fine acorns. In another figured silk the designer has let his humour run riot on monkeys riding queer beasts; the stuff is monochrome, except for the monkeys' caps, which are bright blue, and produce a truly ludicrous effect. A passion these Mediæval fellows had for hunts and life in the wild woods, familiar with all animal life that flies and leaps and crawls in hole, with the habits of the beasts, their good and evil qualities, cunningly expressed in a few swift lines.

Having, in one of my previous articles, given a crude and primitive rendering of the ancient symbol of life or immortality—the two birds or beasts facing each side of the fountain or tree of life—I feel I owe them some reparation, and give you here a sketch made from a capital in S. Vitale at Ravenna. It is one of the great types of ornament in nearly all periods, but in this Byzantine city predominant in many simple, beautiful forms. On one old bishop's tomb, the birds peck at the tree between them, and below the four rivers of the universe flow; on another, it is two lambs with the Monogram, and Alpha and Omega. I give here a rough sketch of this monogram, which is typical, and, to my mind, far more rich and beautiful than anything we can do now. In another extremely charming picturing of the same idea, the two birds stand in rose foliage and flowers between the chalice of the Eucharist, on which is poised the cross, above which, again, the dove descends.

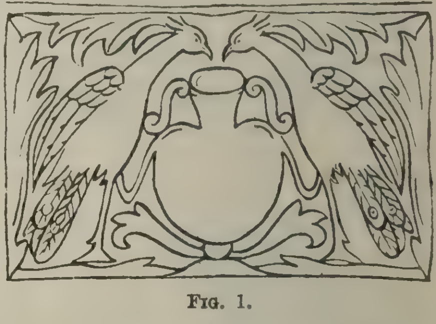

FIG. 1.

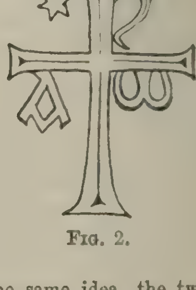

FIG. 2.

It doesn't concern us here whether the Early Christians borrowed Pagan symbols consciously or unconsciously in pressing the new faith upon the world, or how far the curious jumble of new and old went; nor does it concern us whether such signs represent a far earlier life than that preceding Christianity, beyond the reach of modern history; and if I have been tempted to touch on the subject in passing, it is because of the enormous interest I take in such glimpses afforded by early or traditional art into archaic life. But in so far as I have hitherto written on the pessimistic assumption that gone and past design is more interesting and vivid than modern design, and more useful to the student, it is perhaps worth while to consider how far this universal animation and the personification of nature influenced the best art of a nation directly or through tradition, and to note how far it induced the graphic and symbolic element in decorative work. To modern eyes there is a strain of impiety in confusing sacerdotal with secular ornament; but really the mediæval mind was innocent of this in the way he mixed religious ideas with his daily life. Just as a priest could with decency wear a vestment covered with mundane coat-armour that recalled more the splendours of a knight's banqueting-hall than the serious stateliness of God's temple, so the layman would cheerfully don a doublet woven or embroidered with a sacred motto or emblems of immortality. Church and Court, moreover, were nearly drawn together by the traditional union of kingly and priestly office. The influence of this union on early art is a very widespread and noteworthy one, and examples of it will readily occur to you. One need go no further than the Carlovingian kings and their sacerdotal vestments, rich with pictured symbols of their sacred authority and with holy mottoes, as well as with their own personal attributes and devices. A mantle or cope of the Emperor Otto (13th century) is powdered with golden lions, and with the imperial eagle which is among the many symbols of Christ as the Lord of Heaven, the bird that flies proudly into the blaze of heaven's sunlight.

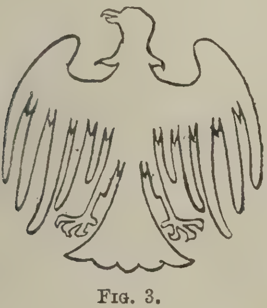

FIG. 3.

Of merely secular dresses, ornamented with birds and beasts, with madrigals and playful legends, our romancers, chroniclers, and inventory-writers (blessings on the latter, with their loving and careful detail, counting each ruby in a jewel, each pearl on the border of a gown!) give us plentiful record. If you have patience for it, read this pretty and fanciful description of a lady's gown in an early metrical remance:—

> In a robe ryght ryall bowne,
> Of a red syclatowne,
>   Be hur fadur side;
> A coronell on hur hedd sett,
> Hur clothys wyth bestes and byrdes wer bete
>   All abowte fer pryde.

This story-telling passion, which spreads gay and serious fancies over everything that is susceptible of ornament, giving us the story of the Creation over a cathedral-porch, an amorous legend round a woman's girdle, a mystic emblem beflowering the cloak of a king, is the very essential and kernel of Mediæval design. The draughtsman of the 12th, 13th, and 14th centuries assimilated the childlike symbolism of earlier times, clothing the crude legend with his characteristic grace and dignity, and with his equally characteristic humour, to miss the significance of which is not to appreciate the Mediæval type with its virility, its gaiety, and simple directness. Like the artist who is sure of himself and dares anything, he spares nothing that will emphasise and animate his story, and indulges himself with comicalities and with a frankness in describing all facts of life which, in a time that is both reticent and hypocritical (every virtue having its own defect), shocks as trivial or coarse. Just fancy the gaiety of mind that produced some of the illuminated MSS., books of Hours, Psalms, Bibles, with borders covered with hunting scenes and all sorts of mundane subjects, and constantly recurring fancies that I can only characterise as screaming jokes. I had in my hand yesterday a Book of Hours of the 13th Century, and among the exquisite little heads and miniature pictures drawn with incomparable sweetness and subtlety, I came upon one joke after another, funny puppies biting their tails off, little men in grotesque attitudes, and finally, a little brown bear standing inanely on his head on a green hill and grinning at me! Who will say that the accomplished monk who worked away at this charming book in those "dark ages" did not enjoy his own jokes immensely, and did not lead, on the whole, a gay and pleasant life?

NEW PICTURES AT THE NATIONAL GALLERY.

DURING the past fortnight seven fresh canvases have been hung on the walls of the National Gallery. Of these two are by British artists, two are Dutch, one is by an unknown artist of the Flemish school, one Tuscan, and one Venetian.

Taking the additions in numerical order, the first is No. 1412, a "Virgin and Child with the Infant St. John," from the Eastlake collection, where it was regarded as a Botticelli; but the ascription is now corrected to his pupil, Filippino Lippi, 1457-1509, of the Tuscan school. It is hung on the north wall of Room III., and is an upright panel, 22in. high by 17in. wide. The Virgin, arrayed in her traditional red robe, with blue mantle, holds in her arms the Infant Christ, who is also clad in blue, and is toying with a burst pomegranate. To the left St. John the Baptist, attired in red, is looking up at his Divine Cousin. In the foreground an open book lies on a shelf, and in the background is an Italian landscape.

Nos. 1413 and 1414 are portraits of Mr. Philip Sansom, as a child and as an elderly man, bequeathed by Miss Ellen Sansom, and are hung on the south wall of Room XX. Each canvas measures about 60in. in height by 42in. in width. No. 1414 is by Richard Westall, R.A., 1765-1836, and is the first example of this artist's work in the Trafalgar-square collection. It represents at full length a chubby boy of two and a half years, dressed in close-fitting white bonnet and white frock, and carrying some flowers; the background is a tree stem and some flowering shrubs. In the second portrait, No. 1413, by Sir Thomas Lawrence, P.R.A., 1769-1830, one subject is shown in three-quarter length as an elderly man with thin grey hair and bold forehead; he is seated, snuffbox in hand, beside an open window commanding a sea-view, and is dressed in the black coat, large cravat, and close-fitting buff knee-breeches of the Regency period.

No. 1418 is a "St. Jerome in his Study," by Antonello da Messina, 1445-1493, who introduced the Flemish style of painting into North Italy, and is hung on a screen in Room VII. It is a vigorous and architecturalesque treatment of the subject, and although undoubtedly low in tone of colouring, is a decided acquisition to the representations of the Venetian school. Framed within a portrayal of masonry crowned by a four-centred archway, is seen in section the interior of the saint's cell and other portions of the monastery on either side. The aged saint, who is habited in monastic robes, and is tonsured, but wears a full beard, is seated before a desk studying a thick volume. On the four wide shelves above are other open books, and above, a two-light Early 14th-century window. A cat is dozing near his feet, and below, in the foreground, are a peacock and red partridge. Beyond the cell to the right we look down a vaulted arcade carried by columns so slender as to suggest the use of cast iron in the artist's day. The attendant lion is on guard in this outer hall, while on the left the mullioned lights in a similar but unvaulted apartment reveal a hilly landscape.

No. 1419 is a "Legend of St. Giles," by an unknown 15th-century painter of the Flemish school, and is hung on the eastern screen under the central dome. It measures 24in. high by 17in. wide, and contains a number of large-scale figures; the composition is divided by an elm tree, beyond which are seen mountains, and on the left a Mediæval fortified city. To the right is the venerable St. Giles receiving into his arms the wounded hind, from whose neck he is extracting the arrow. To the left are a civilian, richly attired in black velvet and gold embroidery, and a priest, while behind are the archer with his bow and arrow, a man riding away on a white horse, and other figures.

No. 1420 is a "View in Haarlem," by Gerrit Berkheyden, 1638-90, and is signed and dated 1674. It is the only work by this well-known Dutch artist in the collection, and is hung on the third screen in Room X. The picture, which measures 21in. by 26in., shows the open market-place of Haarlem to the right, and the west front of the Great Church of St. Bavon, with its lofty central lantern towering over the roofs, and on either side the crow-stepped gables of the merchants' houses, the end of the Stadhuis, which fronts St. Bavon's, and which was built a few years before Berkheyden's birth, being prominent in the foreground.

This picture and the last to be noticed, No. 1421, "Scene on a Terrace with Figures," by Jan Steen, 1626-79, were purchased at the Adrian Hope sale. The latter measures 17in. by 23in., and depicts a terrace in a garden, paved with large squares of black and white marble. A lady in yellow skirt, brown bodice, and black head-dress is seated, and is singing from a book; to her left is a musician, accompanying her on a guitar, and to her right a gaily-attired man is delaying to drink a glass of wine while he listens to her song. He has set a basket of fruit on the terrace, and beyond are seen a little garden walled around, and a wide stretch of open country. The painting is signed "Jan Steen," and is the fourth example of that artist's work at the Gallery.

Other pictures have, we believe, been recently acquired for the National Gallery, and will shortly be on view; while, under the will of the late Sir Austen Layard, the most valuable pictures in his collection will eventually come to the Gallery. These works will include Gentile Bellini's portrait of the Sultan Mehemet, and other works by Ercole Grandi, Montagna, Moretto, Salvoldo, Cima and Del Piombo.

YORKSHIRE SANITARY INSPECTORS' ASSOCIATION.

ABOUT forty members of the Sanitary Inspectors' Association (Yorkshire branch) visited Ripon and Fountains Abbey on Saturday. The urban and rural districts represented were Leeds, Bradford, Halifax, Middlesbrough, Wakefield, York, Ripon, Batley, Wharfedale, Idle, Altofts, Rothwell, Linthwaite, Harrogate, Tadcaster, Hebden Bridge, Morley, Stokesley, Cleckheaton, Warley, Featherstone, Pateley Bridge, and Eccleshill. On arrival at Ripon, the members drove to Studley Park, where they were met by Mr. T. S. Mason, Lord Ripon's agent, with whom they visited Fountains Abbey and the Skeledale Dairy. On returning to Ripon, they were shown over the cathedral. The general meeting was held in the Council Chamber, Mr. T. Pridgin Teale, president of the association, in the chair. Mr. Joseph Lindley, Batley, hon. secretary of the association, read a paper on "Overcrowding." In the rural districts, he said, a medical officer had stated that the housing of the poor was very often worse in those villages where the property was cut up and in the hands of small owners. The difficulty was that thousands of houses were pulled down and not replaced, while the people were driven from rural lanes to the larger villages, where they crowded together. Substantial stone dwellings had been erected in some of the poorest and wildest districts of Ireland under the Labourers' Act. Since 1883 6,463 houses had been built under that Act, and loans sanctioned to the extent of £1,098,000. Such houses would make the village life of England cheerful, bright, and healthy, and would check the influx of the labouring classes into the large towns. The sanitary authorities should, under the statutory powers they possess, provide adequate dwellings, and let them at such a rent as the people could afford to pay. Mr. H. Denham, Tadcaster, condemned the erection of back-to-back houses, and all houses without through ventilation. He advised his authority not to permit rooms to be built of less than 600 cubic feet space. Mr. W. Holmes, Wakefield, compared the non-county boroughs as to single-room houses. Harrogate stood highest on the list, having only one single-room house out of 2,744, and 62 two-room houses, the highest number of residents being six persons in two rooms. Ripon came next with two one-room houses, and 13 two-room houses. Mr. G. Anderson, Middlesbrough, Mr. T. Sutcliffe, Featherstone, and Mr. F. Rothery, Sowerby Bridge, took part in the discussion, upon which Mr. Lindley replied.

BRITISH BUILDING STONES.—X.

A DESCRIPTIVE LIST OF SOME OF THE MOST IMPORTANT STONE QUARRIES IN ENGLAND AND WALES, IRELAND, AND SCOTLAND.

The weights per cube foot are calculated from the specific gravity of each stone, taken specially by the Author for this table. All the stones examined—hand specimens of nearly equal size—were oven-dried for twenty-four hours for the dry weight, and subsequently submerged in water for the saturated weight. The crushing strain, where given, is always in tons per foot super., and the authorities are indicated by letters, thus: (B), Professor Beare; (K), Kirkcaldy, &c.

The local terms in use in the various quarries are retained in this list.

SCOTLAND.

No.	Quarry.	County.	Geological Formation.	Description.	Colour.	Weight of a Cube Foot. Dry.	Weight of a Cube Foot. Wet.	Water Absorbed per Cube Foot.	No. of Cube Feet to 1 ton. Dry.	No. of Cube Feet to 1 ton. Wet.	Remarks. Where used, analysis, crushing strain in tons per ft. super., cost per cube foot.
						lb. oz.	lb. oz.	Pints.	ft. in.	ft. in.	
349	Ardovie ...... Brechin.	Forfar ...	Old Red sandstone. *Devonian.*	Fine sandstone, micaceous, rubs to a smooth surface, bedding discernible.	Bluish grey.	142 6	149 3¼	5½	15 8¾	15 0	Public Library, Municipal Buildings, Cathornel Hall, and principal villas in Brechin, and also in Montrose and Arbroath. Stones not above 4ft. long or 10ft. cube, 1s. 1d. per foot. Stones for oven soles, 1s. 1d. Flat Rybats, 2ft. long, 12in. to 14in. high, 8in. to 10in. on head, 1s. 4d. Flat "ashlar," 7in. to 8in. in bed, 8d. per super. foot. Started Rybats, 2ft. long, 12in. to 14in. high, 6in. to 8in. on head, 10d. Started "ashlar," 7in. on bed, 7d. per super. foot. Coursers, 6in. to 8in. high, 4d. per lineal foot. Putt stones, 1s. per cube foot; Crub, 15in. by 5in., 5½in. per lineal foot; Garling, 10in. broad, 3in. to 4in. thick, 4d. per lineal foot; "ruble," 15d. per ton; foundation stones, 3s. per load. Long stones, cope stones, flat "lentals," and broad stone also sent out quarry-worked. Prices quoted at quarry. This rock is stated to be "the finest to cut, and freest from "calm" of any in Forfarshire."
350	Arns .... Alloa.	Clackmannan	Coal measures. *Carboniferous.*	Fine-grained crystalline sandstone, silicious matrix. No bedding observable.	White, with a grey tinge.	145 7½	151 4½	4⅜	15 4½	14 9½	"A street of houses" in Alloa, Haymarket Station, Edinburgh; and several buildings in Perth, Dundee, and Cowlairs. Cube stones, under 5ft. cube and 5ft. long, 1s.; up to stones under 30ft. cube and 10ft. long, at 4s. per cube foot. Long stones, 6in. thick, and under 5ft. long, 8d.; up to 11in. thick and 10ft. long, at 2s. 7d. per super. foot. Rybats, 20in. by 12in. by 12in. heads, 1s. 2d. each: corners, 20in. by 12in. by 10in., 10d. each. Ashlar, 12in. by 6in., 6d. per lineal foot; coursers, 7in. by 6in., 3d. per lineal foot. Scuntions, 9d.; backs, 6d. each. Founds, common, 3s. per ton; dressed, 8in. thick, 5d. per super. foot. Length not to exceed twice the breadth, nor breadth twice the thickness. All parapet stones charged 10 per cent. extra. Stones under 12in. broad charged as 12in. All prices at quarries.
351	Auchenlodment... Johnstone.	Renfrew..	Lower *Carboniferous.*	Fine-grained sandstone. No mica bedding may be traced.	White, with light-brown stripes parallel to bedding.	134 0½	141 7½	5⅞	16 7½	15 10	This quarry is not worked by the owner; it is let to any builder and contractor to get stone as it may be required.
352	Auchinlea ... Cleland, Motherwell.	Lanark ...	Coal measures. *Carboniferous.*	Fine-grained sandstone. Glassy grains in silicious matrix. A trace of mica. No apparent bedding.	White, with a shade of grey.	131 6¾	139 12½	6¾	17 0½	16 0¾	Tenements in South Buchanan-street, Edinburgh, 1878; Roseburn-terrace, Altbridge, 1882; Carlisle Railway Station, Western Infirmary, Glasgow, and extensively in Lanarkshire. Not suitable for fine carvings. Cube stones, under 15ft., 4d.; up to stones under 60ft., at 4s. 3d.; the length of any stone not to exceed twice the breadth, nor breadth twice the thickness. Broad stones, under 6in. thick and 6ft. super, 8d. per super foot; up to stones 14in. thick and 35ft. super, at 4s. 3d. Long stones, 4ft. by 12in. by 7in., 3s. each; up to 12ft. by 24in. by 11in., £3 14s. 9d. each. Columns, 6ft. long, 15in. by 15in., 18s. 11d. each; up to 15ft. long, 24in. by 24in. each, £16 5s. 10d. each. Wheeling steps, 3ft. 6in. long by 18in. by 7in. thick, 2s. 11d. each; up to 7ft. 6in. long by 32in. by 9in. thick, 18s. 5d. each. The quarry supplies common founds, "scunions," common and natural ashlar, and common and natural rybats. All prices are for stone in quarry. Crushes with 189·8 to 230·5 tons (B). Soft, and gets hard by exposure. Craig stated at meeting of the Edinburgh Geological Society, May 5, 1892, that Auchinlea is considered a poor stone.
353	Auldbar ...... Arbroath.	Forfar ...	Old red sandstone, *Devonian.*	Fine-grained compact sandstone. Little mica, takes a polish; bedding obvious.	Dark greenish grey.	153 14¼	155 14	1¾	14 7	14 3½	Auldbar Castle. Dressed pavement, 8ft. to 10ft. super., 2in. to 2½in. thick, 6½d.; 3in., 7d.; 4in., 8d. Second-class pavement, 2in. to 2½in. thick, 5½d. per foot super. Polishing, ¾d. extra. Sawn, jointed, 2in. to 3in. thick, 1d.; 4in. thick, 1½d. extra. Sized stone, not containing more than 10ft., 3in. thick, 8d.; 9in. thick, 1s. 9d.; not more than 62ft. super. and 3in. thick, 2s. 10d.; 9in. thick, 3s. 11d. Steps, sent out (1) dressed on tread only; (2) dressed on tread and sawn in breast; (3) dressed on tread and plain breasted; and (4) dressed on tread and "bottled." Wheel steps, 1d. per foot extra. Step covers and Platts also worked and sent out sawn, planed, or bottled. Crushed with 512·5 to 628·3 tons (B). Price on rail-truck at quarry.
354	Balgavies..... Arbroath.	Forfar ...	Old Red sandstone. *Devonian.*	Fine-grained compact sandstone, rubs to smooth surface. Little mica, bedding not distinct.	Bluish grey.	155 12	157 4	1¼	14 3¾	14 2½	Worked by same owners as No. 353. Quarry prices same.
355	Ballochmyle Mauchline.	Ayr.........	Permian. New Red sandstone.	Fine-grained sandstone, rubs to a rough surface; bedding observable.	Brownish red.	123 0¾	133 7	8⅞	18 2½	16 9¼	Hyndland Church, Glasgow, 1885; Spier's School, Beith, near Glasgow, 1887; Burns's monument, Kilmarnock, 1881; Railway station and hotel, Ayr, 1884; Lyndoch railway station, Greenock, 1894; Crescent's Church, Belfast, 1885. Quarries worked for 70 years. Proprietor says of the stone: "Its weather qualities are of an exceptionally high order. It is produced and sold cheaply, and although it stands a high pressure test, it is very easily chiselled." Dressed and sawn by hand or machinery.
356	Ben Cruachan.	Argyle ...	Granite.	Quartz hornblende and orthoclase; no mica.	Dark mottled grey.	170 4¾	170 10½	¼	13 1¾	13 1½	Crushes with 766·8 to 1008·0 tons (B).
357	Binny........... Uphall.	Linlithgow..	Sandstone. Oil Shale series. *Lower Carboniferous.*	Fine-grained sandstone; micaceous bedding may be traced, rubs smooth.	Dark slate grey, black when wet.	138 13	140 1¾	1	16 1½	15 11¾	Bank of Scotland, 1806; Scott Monument, 1840-6; Donaldson Hospital, 1842-51; National Gallery, 1850-9; Post Office, 1866; Assembly Hall and Spire, 1842; Edinburgh fountain in front of Holyrood Palace. Cube stones under 5ft. cube and 5ft. long, 3s.; under 20ft. cube and 30ft. long, 5s. 6d. per cube foot. Random ashlar up to 12in. by 6in., and under 5ft. long, 1s. per lineal foot; ashlar, 12in. to 15in. broad, charged superficial, rybats, 2s. 6d. each. Broad stones, not exceeding 5ft. super., and under 5ft. long and 6in. thick, 2s. per super. foot. On truck, Uphall Station, or on carts at quarry.
358	Bonhill ...... Alexandria.	Dumbarton.	Old red sandstone. *Devonian.*	Fine-grained sandstone, with mica in planes of bedding.	Dull red.	134 6	142 5½	6⅜	16 8	15 8¾	Parish Church, Jamestown; Parish Church, Reuter; Scottish Girls' Friendly Institute, Ewing-Gilmour Institute, Public Schools, Public Hall, and Free Church, Alexandria. Cube stone under 15ft., 1s.; 30ft., 1s. 8d.; 40ft., 2s. 3d.; 50ft., 3s. 1d.; 60ft., 4s. Length not to exceed twice the breadth, ner breadth twice the thickness. Broad stones under 6ft. and 6in. thick, 8d.; up to 35ft. and 14in. thick, at 4s. 3d. per super. foot. Copes 12in. by 6in., 8½d.; 12in. by 14in., 1s. 7d.; 26in. by 6in., 2s. 1d.; 26in. by 14in., 4s. 2d. Cope and cornice, when the breadth exceeds three times the thickness, the thickness will be charged at one-third the breadth. Long stones 4ft. by 12in. by 7, 2s. 10d.; up to 12ft. by 24in. by 11in., 74s. 7d. each. Columns and wheeling steps supplied. Carting to station, 1s. 6d. per cart. Beds up to 4ft. thick .

359	Blebo .... Cupar.	Fife........	Old Red sandstone. *Devonian.*	Fine-grained sandstone, ochrey spots in matrix; bedding not distinct.	Dark cream.	126 1½	136 10¾	8⅜	17 9¼	16 4½	Cube stones, not above 15ft. in each stone, 10d. per cube foot, on rails at Dairsie Station; Lathallan House, near Edinburgh; Seggie House, Guardbridge; also used in Perth, Broughty Ferry, and Dundee. The quarries are old-established. "The stone is a good wearing one, and no risk would be run in using it.
360	Bothwell Park Bothwell.	Lanark....	Coal measures. *Devonian.*	Moderately fine-grained sandstone, little mica; bedding may be discerned.	Purplish brown.	132 12¾	140 7½	6⅜	16 10¼	15 11¼	Cube stones under 15ft., 1s. 2d.; 30ft., 1s. 10d.; 40ft., 2s. 5d.; 50ft., 3s. 3d.; 60ft., 4s. 3d. Rubble 1s. 8d. per ton, 2s. 3d. per cart. Rybats, common, 1s. 4d.; natural, 1s. 6d. each. Ashlar 12in. high: common, 7d.; natural, 8d. Common courses 4d. per cubic foot. Scuntions, 1s. each; backs, 9d. each. Jambs, broad stones, long stones, copes, columns, and wheeling-steps prepared in the quarry.
361	Brax .... Arbroath.	Forfar ...	Old red sandstone. *Devonian.*	Moderately fine grain, micaceous sandstone; bedding not observable.	Light liver-brown.	140 7¼	147 5½	5½	15 11¼	15 2½	Tyvie Castle, Aberdeen. Blocks, 1s. 2d. per foot; flat stones, 9in. thick, 10d. per foot super. Sills and lintels, 4ft. long, 3s. 6d. each; 4ft. 6in. long, 4s. each. Rybats and corners, 1s. each. Courses, 3½d. per line foot. Ashlar, 12in. by 7in., 7d. per foot, on rail at Colliston Station. The two public schools, St. Margaret's Church, Eltrie and Colliston Castles (additions to), and about one half the town of Arbroath. Quarry beds from 3ft. to 9ft. thick.
362	Bridgend...... Brechin.	Forfar ...	Old red sandstone. *Devonian.*	Hard, fine grained, compact sandstone, glassy quartz grains, mica; bedding not discernible.	Purplish grey.	144 15	149 15¼	4	15 5½	14 11	New Board Schools, Arbroath; new Municipal Buildings and Clydesdale Bank, Brechin. Stones not above 4ft. long, and not more than 10ft. cube, 1s. Flat Rybats, 2ft. long, 12in. to 14in. high, 8in. to 10in. on head, 10d.; flat "ashler," 7in. to 8in. on bed, per super. foot, 8d.; started rybats, 2ft. long, 12in. to 14in. high, 6in. to 8in. on head, 10d.; started "ashler," 7in. on bed, per superficial foot, 7d.; coursers, 6in. to 8in. high, per lineal foot, 4½d. Extra sized rybats, "ashlers," and putt stones, 1s. per cube foot; crub, 18in. by 6in., 8d. per lineal foot; garling, 10in. broad, 3in. to 4in. thick, per lineal foot, 5d.; "ruble," 1s. 9d. per ton. Long-stones, broad stones, and drain covers worked in this quarry. 10d. per ton for delivery to Brechin Station.
363	Broomhill ... Larkhall.	Lanark....	Coal measures. *Carboniferous.*	Compact, moderately fine-grained sandstone, rubs smooth; bedding not distinct.	Dark brownish grey	132 5½	139 9⅝	5¾	16 11	16 0½	
364	Broomwell... Monickie. Dundee.	Forfar ...	Old red sandstone. *Devonian.*	Coarse-grained sandstone, with angular quartz pebbles, highly crystalline. No bedding observable.	Grey, with a greenish tinge	136 4	144 0½	6¼	16 5¼	15 6½	Sailors' Home, Mather's Hotel, Whitehall-street, ex-Provost Mathewson's property, St. Andrew-street, Dundee; Grove Schools, Broughty Ferry, near Dundee. 1s. 2d. per cube foot sawn and faced; 1s. 3d. sawn on two edges, free on rail at quarry.
365	Caithness ... Thurso.	Caithness	Middle Old Red sandstone. *Devonian.*	Very hard, compact slaty sandstone, fine-grained, mica in bedding, which is very distinct, bituminous.	Dark-blue, slate grey.	166 14½	167 0½	⅜	13 5	13 5	There are several quarries in the "Caithness flags" in this county. The stone is used for paving. Mr. Buchanan, in a paper read before the Scottish Society of Arts, gave the following as the relative transverse strengths of this and other stones:—Caithness, 1,500; Arbroath, 821; Craigleith, 510; Hails, 353 (used as lintels). It is estimated that the old red sandstone series in Caithness is 16,000ft. thick. The Caithness flags were placed in the "Middle" old red sandstone by Murchison and other geologists—a division peculiar to this county; but Geikie maintains they really belong to the "Lower" old red of the English counties, and that there is no evidence of any middle division. Flagging, natural face, with sawn edge, 2in. thick, 3s. 4d.; 3in. thick, 4s. 5½d. per super. yard. Polished, 2in., 4s. 4d.; 3in., 6s. 2½d.; on rail Thurso.
366	Cambus O'May... Ballater.	Aberdeen.	Granite.	Quartz, orthoclase and biotite.	Grey.	161 11½	162 2	¼	13 10¼	13 9½	This quarry is known as Tomnikiest. This stone is sold at 1s. 6d. per cube foot on rail at Cambus O'May Station.
367	Camperdown . Lochee, Dundee.	Forfar ...	Old Red sandstone. *Devonian.*	Moderately fine-grained micaceous sandstone, bedding not distinct. A "Liver" rock.	Brownish grey.	148 10½	153 7¼	3⅞	15 8	14 7	Restoration of old steeple, Dundee, 20 years ago; St. John's Church, Perth; a number of public buildings, mills, offices, and factories at Dundee. Stones not less than 12in. thick, and not containing more than 10 cube feet, 1s. 6d. per cube foot; containing more than 10ft. and not over 20ft., 1s. 9d. All quarry-dressed, and delivered at Lochee or Dundee stations.
368	Carmyllie ... Arbroath (6)	Forfar ...	Old Red sandstone. *Devonian.*	Fine-grained, close-textured, micaceous sandstone. Bedding not distinct.	Dark grey.	153 14¾	157 8	2⅞	14 6¾	14 2½	Mainly used for pavement, steps, landings, sills, lintels, &c.; Glasgow, Inverness, Edinburgh, and other post offices; Hartwood, Hawkhead, and Gartloch asylum; Sized stones, not containing more than 10ft. super., 2½in. thick, 7d.; up to 9in. thick, 1s. 9d. per foot; containing not more than 6ft. 2in. thick, 2s. 10d.; up to 9in. thick, 3s. 11d.; double facing up to 25ft. 2d., above 25ft. 3d. per foot extra. Steps *dressed*, per superficial foot, on tread only, 3ft. long and 6in. thick, 8d.; on tread and sawn on breast, 10d.; on tread and planed on breast, 1s.; on tread and "bottled," 1s. 6d. Free on rail. Crushes with 512·5 to 533·6 tons (B). Beds 2½in. to 20in. thick.
369	Clunievar ... Dunfermline	Fife.........	Roslin sandstone, millstone grit. *Carboniferous.*	Very fine-grained sandstone, micaceous bedding may be traced.	Light grey.	132 4¾	140 1⅝	6¼	16 11	15 11¾	Tenements at 38, March Mount-crescent, Edinburgh, 1881; 42, Roseburn-terrace, Coltbridge; North Junction-street, Leith, 1891. Cube stones, not exceeding 10ft. cube, 10d.; 15ft., 1s. 1d.; 20ft. 1s. 4d. Ling stone, not exceeding 5ft. long and 6in. thick, 6½d.; up to 11in. thick, 11d.; up to 10ft. long and 11in. thick, 1s. 11d. per super. foot. Ashlar, 12in. by 6in., 5½d. per linl. foot; Rybats, common, 11d., with 12in. heads, 1s. 1d.; scuntions, 7d.; coursers, 3d. per foot; "ruble," 1s. per ton; square "ruble," 3s. 6d. per ton. Prices at quarry.
370	Corennie ...... Alford (6).	Aberdeen.	Granite.	Glassy quartz, and pink orthoclase.	Pinkish red.	162 14¾	162 14⅝	—	13 9¾	13 9¾	New Municipal Buildings, Glasgow. Crushes with 1098 to 1,449 tons (B).
371	Corncockle...	Dumfries	Permian.	Moderately fine-grained sandstone. with mica. Coarser grit, and more highly crystalline than Corsehill stone.	Brownish red.	127 0	139 12⅝	7⅞	17 7½	16 4¼	Lochend-road School, 1886; Milton House School, 1886; Castle Hill School, Edinburgh, 1886; Jardine Hall, 1800; Hydropathic Establishment, Peebles. Extensively in Lockerbie, Moffatt, and neighbourhood. *Hard rock:* Common rubble, 2s.; large ditto, 3s. 6d. Rippers 4s. 6d. per ton. Foundations up to 6in. thick, self-bedded and squared 4d. per foot super. All above 8in. thick at 7d. per cube foot. Self-bedded flags, 3in. thick, 2s. 3d. per yard; polished for hearths 1s. per yard extra. *Soft rock:* Common rubble, 2s. per ton; scuntions and corners, or "cant," averaging 12in. in height and 18in. to 20in. long, 6d. each. Rybats and quoins, coursers, lintels, sills, mullions, and jambs quoted for in quarry list. Dimension block, 20 to 30ft. cube, 9d.; up to 80ft. cube, 2s. 6d. Random blocks up to 30ft. cube, 8d.; up to 50ft. and averaging 25ft., 9d. per cube foot on rail at Nethercleugh Station. "A dark streak runs through this stone here and there; but it disappears in from six to twelve months." Crushes with 264·7 to 427·3 tons (B).

THE THRUSTS ON WALLS AND ARCHES.*

By G. A. T. MIDDLETON.

CHAPTER V.—RETAINING WALLS SUBJECT TO WATER PRESSURE.

WATER, being a fluid, has an angle of repose of zero, and cannot be surcharged. This is the essential difference between it and earth, while its weight varies so little according to its temperature and ingredients as to be for all practical purposes always 62·5lb. per cubic foot. Thus to calculate water pressures is easy to anyone who has mastered earth pressures, the same rules being applicable.

Reference to Fig. 15 will show that A B being the bottom, and D C the top, of the water in a reservoir, retained by a vertically-backed wall at D A, and the natural slope being horizontally along the line A B, the complementary angle is the whole angle B A D, and this being bisected by the line A C, according to the rules laid down in the last chapter, the triangular prism of water which is active to cause thrust is that shown in section by the triangle C A D. The weight of this is collected at its centre of gravity, whence it acts vertically downwards, impinging upon the line A C at E, where it is resolved into two forces, E H and E G, of which E H is the force tending to overturn the wall, to the scale to which the weight A F of the triangular prism C A D was set downwards from E.

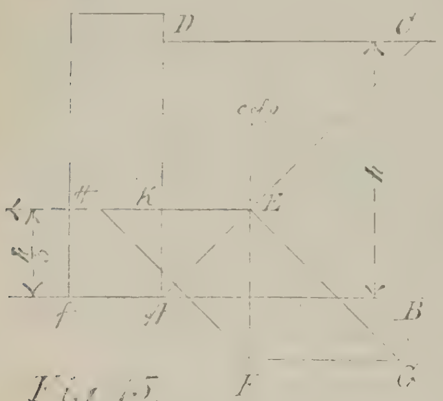

Fig. 15.

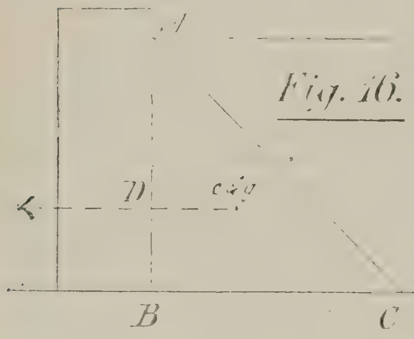

Fig. 16.

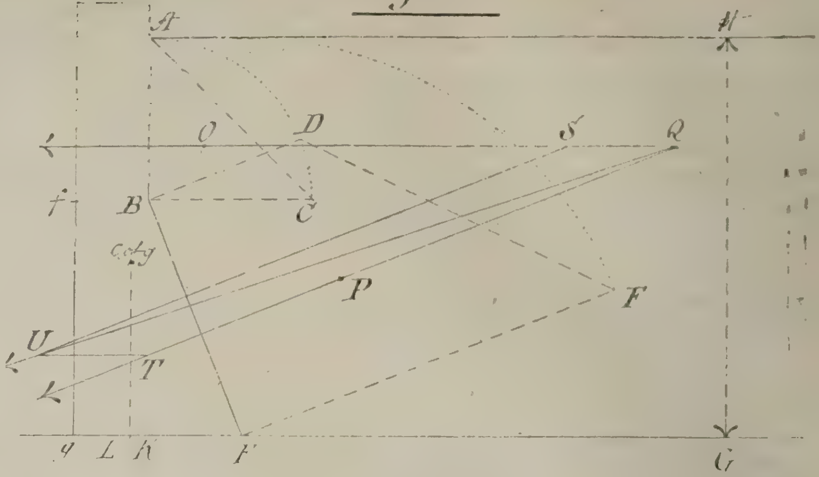
A little examination of the diagram will show that E F being vertical, H E horizontal, and E G at right angles to A G, which itself bisects the right angle D A B, therefore the angles E H F and E F H are both angles of 45°, and, therefore, that H E = E F. In other words, the force E H tending to overturn the wall is equal to the weight of the triangular prism of water, C A D.

It will further be seen that the distance A K at which this force acts from the base of wall is exactly one-third of the depth of the water A D, for the vertical line through the c.g. of the triangle C A D, being parallel to A D, and impinging upon A C at E, makes $A E = \frac{A C}{3}$ and, similarly. E K being parallel to C D, therefore A K : A D : : A E : A C, which proves the proposition.

It is more convenient, and quite as correct in practice, to reverse the prism, as shown in Fig. 16, and to say didactically that the pressure against the back of the wall A B is equal to the weight of the 45° triangular prism of water A B C, acting horizontally through its centre of gravity, and thus impinging upon A B at D, D B being equal to $\frac{A B}{3}$.

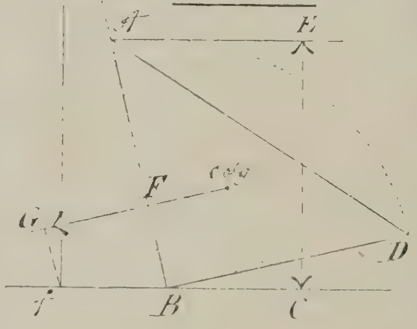
Fig. 18.



In one very marked respect, however, does water act in a different manner from earth. Being a fluid, it always presses perpendicularly against the surfaces opposed to it.

This is a most valuable property, and is largely taken advantage of in designing retaining walls by battering them internally. The effect of thus battering a simple wall is shown in Fig. 17. The triangular prism is formed by drawing B D at right angles to the battered face A B, and equal in length to the vertical depth C E. The c.g. of the triangle A B D thus formed is found, and the weight of the triangle acts through it, along the line F G, perpendicularly to the inclined side A B, forming the pressure which tends to overtake the wall, and acting at the distance fG round the point f of overturning.

Fig. 17.



It will thus be seen that, though the pressure of water against the side of the wall is slightly increased, A B being greater than the vertical depth C E, the moment of overturning is largely diminished, fG being much less than $\frac{C E}{3}$.

It is not altogether unusual to build a wall as shown in Fig. 18, with the upper portion vertical, and the lower battered. In such an instance, two calculations are necessary—for the upper portion only, as rotating about f; and for the whole wall, upper and lower portions combined, as rotating about g. The upper portion A B may be considered to be pressed against by the weight of the triangular prism of water A B C acting horizontally through its centre of gravity, O. The lower sloped portion B E has a curiously-shaped prism of water acting against it, represented by the polygon B E F D, of which B D is drawn at right angles to B E, and is equal to the depth B A of the point B from the surface of the water; while the line E F is also drawn at right angles to B E, and is equal to the depth H G of the point E from the surface of the water. The weight of this prism, B E F D, is collected at its centre of gravity, P, and acts perpendicularly to the inclined surface B E.

To obtain the resultant pressure against the whole wall, it is necessary to combine the pressure of the triangular prism A B C passing horizontally through O, and the pressure of the irregular prism B E F D passing through P, by continuing their directions back till they meet in Q, and there setting up a parallelogram of forces, Q S U T, of which Q S represents the action of the triangular prism in magnitude and direction, and Q T similarly represents the action of the irregular prism, and of which Q U is the resultant.

This, of course, has to be combined with the weight of wall acting through its centre of gravity vertically downwards to obtain the eventual resultant, which must pass within the base of the wall as against actual overturning. As already said, however, it should pass well within the base of the wall to secure anything like uniform variance of pressure, but how far within is not always easy to determine. In practice, however, it may be said that if the vertical line through the centre of gravity of the wall cut the base at K, the final resultant should pass between K and L, the line K L being one-third of the line Kg.

CHIPS.

Mr. H. Cartwright Reid, civil engineer, Admiralty Works Department, is about to proceed to Nova Scotia, to take charge at the Government dockyards of Halifax, Jamaica, and Antigua.

The tender of Messrs. Nicks Brothers, builders, of Bradninch, has been accepted for the restoration of Blackborough Church. The work will be commenced forthwith.

New National schools were opened at Wharton last week. The infant schoolroom is 48ft. by 24ft.; the classroom 28ft. by 20ft.; and the cloakroom 24ft. by 12ft. The rooms are 19ft. high. The architect was Mr. J. Waring, and the builder Mr. Sergeant.

The remains of Mr. William Jackson, a well-known Leicester architect, residing in Stoneygate, have been discovered under extraordinary circumstances. For two weeks deceased, an elderly man and rather eccentric, residing alone, has not been seen; and it was thought that he was away for a holiday, until the neighbours' suspicion was aroused by an offensive smell emanating from the premises. They were broken into on Wednesday week, when Jackson was found dead in bed. The cause of death is unknown.

Mr. H. Gilbert Whyatt, A.M.Inst.C.E., M.S.I., deputy borough engineer, Salford, has received an invitation to deliver a course of twenty evening lectures on Sanitary Engineering, at Owens College, during the coming winter. The lectures form a portion of the whole course in connection with the certificate of proficiency in hygiene and sanitary knowledge issued by the Victoria University to inspectors of nuisances.

The United Methodist Free Church at St. Just in Penwith, is to be renovated and enlarged, from plans prepared by Mr. J. W. Trounson, architect, of Penzance, and the work will be carried out under his superintendence.

The foundation stone of the new church of All Saints', Galley-hill, Swanscombe, Kent, was laid on Wednesday week. The building is estimated to cost nearly £6,000; it is being built in the Early Decorated style, from the design of Mr. R. Norman Shaw, R.A., of London. It will eventually consist of a nave, chancel, and north and south aisles; but the latter will not be built at present. The materials used are brick and flint, with Bath stone dressings.

CHURCH EMBROIDERY: BY MAY MORRIS. — NEW PREMISES FOR THE CHESTER BOAT COMPANY. — DESIGNS FOR CHRIST'S HOSPITAL NEW SCHOOLS AT HORSHAM.—HOUSE AT BARNT GREEN.—DESIGNS FOR A PAIR OF LABOURERS' COTTAGES.

Our Illustrations.

CHURCH EMBROIDERY.

(FOR May Morris's article and further sketches see p. 66.)

CHESTER BOAT COMPANY'S PREMISES.

THESE premises, illustrated to-day from the architects' drawings now on view at the Royal Academy, have been erected for the Chester Boat Co., whose pleasure boating business is so well known upon the banks of the Dee. The entrance block consists of manager's house and bar accommodation, all of which was remodelled from the old uninteresting premises, the outer face being recased and half-timbered, as shown in views. The entrance gateway, ladies' retiring-room, and manager's office are entirely new, and the works have been carried out by Messrs. George Forester and Sons, builders, of Chester, who were obliged to carry out the work in sections, so as not to interfere with the refreshment business. In the grounds there has been a large oar and scull-shed erected, over which is a gentleman's retiring-room, with baths, &c., and this portion has been carried out by Mr. W. W. Freeman, builder, of Chester, and both were under the superintendence of Messrs. Thos. M. Lockwood and Sons, architects, Chester. We shall illustrate the scull-shed and retiring-rooms block shortly.

CHRIST'S HOSPITAL BOARDING SCHOOLS, HORSHAM, SUSSEX.

TO-DAY we finish our series of plates illustrative of the designs of this competition.* The double-page view of Messrs. Paley, Austin, and Paley's design represents the buildings from the south, looking into the Cloister-court, with the College Chapel on the right, and the music-house, dining-hall, and first block of school residences on the left of the spectator. The statue of King Edward VI. occupies a central position as shown by the plan of the whole scheme, which we published in our issue for June 29th. The first single-page plate herewith furnishes an interior perspective of the great apsidal-ended assembly or schools' hall, the exterior of which, by the same architects, appeared on the same date as their general plan. The last sheet represents another view of Messrs. Carpenter and Ingelow's design, taking in the great hall and chapel, as well as their clock-tower seen from the great cloistered quadrangle which made the leading feature in this design.

HOUSE, BARNT GREEN.

THIS half-timber house, of local bricks and Madeley Wood tiles, was designed by the architect, M. T. W. F. Newton, 121, Colmore-row, Birmingham, for his own occupation. Builders Messrs. Huins and Sons, Redditch.

"BUILDING NEWS" DESIGNING CLUB: A PAIR OF LABOURERS' COTTAGES.

WE illustrate this week the designs for a pair of Labourers' Cottages we have placed first and second in our "Club" competition. Critical remarks of all the plans received will be found on p. 65.

ARCHÆOLOGICAL.

PREHISTORIC REMAINS AT MENTONE. — M. Adolphe Megret, a Paris sculptor, writes: On the 12th January last, M. Abbo, master quarryman, who is exploiting the massive rocks known under the name of Baoussé-Roussé, near Mentone, was informed by his son, at work in one of the caverns (the Barma Grande), of the presence of a human skeleton, which he had partly uncovered. On the two following days the exhumation of this prehistoric human skeleton was completed. The remains were found in what seemed to have been one of the last beds superposed, known under the name of "foyers," or layers. Mixed with the *débris* are bones of animals, some of which have been identified as belonging to primitive and extinct species, while others may have served as food for the early human inhabitants of the earth. Most of the bones seemed to have been broken for the purpose of extracting the marrow. The upper part of the beds was covered with charcoal, ashes, and flints, whilst amongst these were found all sorts of primitive implements, affording undeniable evidence of the direction in which prehistoric man's industry took shape. Specimens were discovered of rough, uncut flints, hammer-stones, shells, and fish-bones, some of the latter articles being pierced and otherwise treated as if they had been adapted for useful or ornamental purposes. It seems to the writer as if the skeleton under notice had been one of the last of his species, the body having been discovered in one of the last deposits in the cavern, about 40ft. above what appears to have been the original level of the grotto. The skeleton was lying only about 10ft. above three others, which were found in a group in the year 1892, and described by Mr. G. Evans in the *Anthropologist*, as well as by M. le Dr. Verneau, of Paris. The body lay on the right part of the wall of the cavern, the skull nearly touching it. The remains are comparatively well preserved, considering the ancient period of interment. The right arm and the carp and metacarp of the hand are perfect. The head was lying towards the north-east; the body was curved and receding to a backward position—the leg and feet being at an open angle towards the south-west. The left leg was slightly bent under the right one, the feet closed together. The right arm was folded first backward from the shoulder, the elbow touching the soil; while the forearm was extended at right angles, the hand being placed on the chest. The left hand supported the head under the jaw. Altogether the attitude of the body was that of a man who had been sound asleep and unconscious when he died. Although there are slight differences in the positions in which these remains of prehistoric man are found in these caves, all the bodies, in spite of the incalculable time which has elapsed since they breathed their last, present the appearance of a man asleep. At the side on the ground lay a very large stone, rough and thick, of a trapezoidal form. Near the right arm was another large stone, several others being found near the left. These stones appear to have been worked, and bear traces of the action of fire.

CHIPS.

Mr. Bromley has resigned the appointment he has held for many years of engineer and surveyor to the Heston and Isleworth local board.

The Leeds Corporation have purchased for their permanent gallery the picture entitled "Homewards," by Fred Hall.

A new schoolroom, accommodating 250 persons, has been added to Brynsion Chapel at Treignon, near Aberdare. Mr. D. Davies, of Aberdare, was the contractor.

The school board for Leith, after considerable discussion, have adopted revised plans prepared by Mr. Craig, architect, for the reconstruction of the Academy, estimated to cost about £18,000.

The death is announced of Mr. Robert Robertson, Claremont, Moffat, who for some twenty years was road surveyor in the Mid and Upper Annandale district of Dumfriesshire.

COMPETITIONS.

GOOLE.—At the adjourned meeting of the general purposes committee, held to determine the award in connection with the competition for new Market Hall plans, Goole, that body recommended the design marked No. 35 for adoption, and ultimately this decision was confirmed by the board, who awarded the first premium of £100 to Mr. W. J. Tennant, architect, Ropergate, Pontefract. With regard to the second prize of £50, the board resolved that the merits of the designs distinguished by Nos. 2 and 13 being nearly equal, the prize should be divided between the authors of these plans, and this was agreed to. No. 2 was sent in by Mr. H. B. Thorp, architect, of Goole, and the designer of No. 13 is Mr. Athron, architect, of Doncaster. The decision was made in secret, the Press being excluded; but from the debate as printed in the local papers, it seems that the advice of Mr. Brown, to whom reference has already been made as the expert builder or architect employed by the committee at a small fee to assist in the award, was not followed, and his report, whatever its merit, is not to be made public. This course has naturally led to some strong expressions in the Goole newspapers, and, anyway, it is always a matter of regret when competitions are not conducted without recourse to a secret conclave.

HEAMOOR, CORNWALL.—The trustees of the Wesleyan Methodist Chapel of Heamoor, Madron, have selected the plans for their new church submitted by Mr. J. Wm. Trounson, architect, of Penzance.

INVERNESS.—Ten sets of plans were submitted in competition for an extensive stabling and posting establishment for Messrs. MacRae and Dick, the well-known Northern horse hirers. Mr. W. C. Joass, architect, assisted as professional assessor, and the plans sent in by Mr. Duncan Cameron, architect, Inverness, were selected. The premises provide accommodation for about 160 horses, 135 carriages, 13 loose-boxes, and extensive storage for hay, straw, grain, &c. There are also large painting, blacksmith, and carpenter shops, offices, men's barracks, and boiler-houses. The central covered yard measures over 160ft. by 80ft. It is intended to light the buildings by electricity.

LIVERPOOL. — The Liverpool School Board, after a long and animated discussion, decided on Monday to invite four architects practising in the city—Messrs. George Bradbury, 14, Cook-street; C. E. Deacon, Central Buildings, North John-street; Edmund Kirby, 2, South John-street; and T. Mellard Reade, 2, South John-street—to send in competitive plans for the new offices of the board, proposed to be erected in St. Thomas-street. A proposal to throw the competition open to all Liverpool architects was rejected by seven votes to six.

MONMOUTH.—Under "Competitions" in our issue of the 6th inst. we gave John Parkin and Son, of Westminster, as winners of the second prize. This should have been John Parkin and Son, of Idridgehay, and 3, St. Mary's Gate, Derby.

STOCKPORT WORKHOUSE.—For some fourteen years past the Stockport board of guardians have intermittently discussed the question whether they should build an entirely new workhouse or reconstruct and enlarge the existing one. Recently a forward movement was made, and 25 acres of land were purchased as a site for a new building. Competitive plans were invited, and on the recommendation of Mr. W. H. Ward, architect, of Birmingham, the first premium of £300 was awarded to Messrs. Booth and Chadwick, of Manchester, and the second to Messrs. Mangnall and Littlewoods, of Manchester. At a subsequent meeting it was decided to send the plans placed first and second to the Local Government Board, in the hope that that body might possibly determine which should be carried out. The town councils of Stockport and Hyde then wrote to the Local Government Board protesting against the proposal to spend £40,000, and asked the authority to exercise its influence to prevent action being taken till after the election of a new board of guardians next November. The guardians have held another stormy meeting at which they appeared much divided in opinion, and in the end cheques for the premiums have been sent without note or comment to the successful competitors, thus discharging the mutual liabilities of architects and guardians so far as the competition is concerned.

WAYSIDE NOTES.

Mr. MOUNTFORD'S reasonable query, embodied in his letter printed in last Friday's Building News, directs attention to a matter of very considerable importance to all architects. The subject of the unusual terms laid down for the competition for the Cripplegate Institute was, I see, specially referred to in your pages as long since as September 29th last year, and the Building News once more ranks as the only professional journal which pointed out proceedings detrimental to the profession. Mr. Mountford, however, has avoided all reference to what, after all, is the most questionable part of the proceedings, and that is the semi-official connection with the undertaking of the late President of the Royal Institute of British Architects, Mr. MacVicar Anderson, who acted as professional referee. It was well known what the terms of the contest were, and so soon as these conditions were issued to the selected competitors, three at least of the invited architects (two of whom are conspicuous members of the Council of the R.I.B.A.) declined to have anything more to do with the proceedings, for they considered, as you did, that the commission of 4 per cent. was not a usual and adequate remuneration for capable services in designing and carrying out so complicated and elaborate a building as the Cripplegate Institute. This must also have been patent to the assessor, who, by continuing his connection with the competition, gave it an authoritative approval, seeing that he had been appointed as referee because he held the office of President of the R.I.B.A. It can be no excuse on his part if he should urge that, had he not consented to act as umpire, someone else would be found willing to undertake the somewhat invidious task and accept the fee consequent upon it. It is of small moment comparatively whether the actual competitors who accepted the terms offered are or are not correctly described as "well-known" architects, the detrimental factor calculated to permanently damage the interest of all architects, and particularly the less famous and less fortunate ones, is that Mr. MacVicar Anderson, as official representative of the oldest professional society, gave his countenance to these proceedings, which, in other respects, your correspondent, Mr. Mountford, has so adequately estimated.

A Cornish correspondent writes to me complaining that in a recent Wesleyan chapel competition one of the competitors, a F.R.I.B.A., sent a letter with his plans promising that if his design were selected he would give half his fees to the building fund—in other words, he was willing to undersell his fellow practitioners and carry out the work for 2½ per cent. The bait, I am glad to hear, did not take; some other design was selected, the chairman of the committee telling the members who hesitated at rejecting such a proposal, it would be neither right nor fair to choose the plan of a man who would offer such a bribe. If an architect is interested in a church or chapel, there is no reason why he should not send them a donation; but let it be done after the competition is decided, so that the purity of his motive may not be impugned. By the way, I would recommend the secretary of this building committee to write to the F.R.I.B.A. in question for some help towards the building fund, and to forward you Mr. ——'s reply, with a note as to the amount of the cheque that will, of course, accompany it.

The metropolitan valuation for assessment purposes takes place every five years, and the time for the revision of the valuation is again near at hand. In view of its approach, the County Council are taking measures for the examination of all the assessments in the metropolis, with a view to their being applied on one equitable principle all round. Many houses are greatly undervalued in consequence of the dishonesty of the landlords or the tenants, and some, no doubt, though probably few, are over-assessed. The richer districts especially are notoriously under-rated, and consequently they escape from the common burden in a double way, thereby increasing the infliction upon the poorer parts of London. The general result of a thorough examination of the assessments will be a considerable increase of assessment on an enormous number of houses tenanted by all classes. But it will, unfortunately, not stop with the ordinary public rates, for, as the water companies levy their assessment upon the rental, any increase in the assessable value adds to their already large gains!

The number of estates which have been brought to the hammer at Tokenhouse-yard lately has been unprecedentedly large, and the buyers have been unprecedentedly few. The estates have been scattered all over England and Scotland, with every temptation that romantic beauty or a picturesque and pleasant situation could give. Not even the Inverness-shire estate containing the famous Falls of Foyers commanded as much as a single offer, though, according to Christopher North, the Lower Fall is the most magnificent cataract in Great Britain. There was some bidding for several of the English estates exposed for sale, which lie in Hampshire, Hertfordshire, the Isle of Wight, and near Tunbridge Wells. None of the large properties changed hands, and only 200 acres in England found new proprietors. Investors are not merely afraid of the effect of the Budget upon landed possessions. If a man looks upon the graduated scale of estate duty as a mere thin end of the wedge, he will keep aloof from investments in land at present. Should the estate duty, as Tory landlords in the House have been arguing, compel owners to throw their estates, or portions of them, into the market, the effect will naturally be to pull down the average of value. But, besides this, there is gradually growing in the minds of men of all political opinions the conviction that the days of the private landowner in England are numbered.

The inhabitants of Toronto, I see, are boasting that they now possess the highest chimney in Canada, and one of the highest on the American continent. It has been built for the Toronto Street Railway Workshops, and has an elevation of 250 feet. But they have not the highest chimney in the world, nor, for the matter of that, has America. That honour, I believe, belongs to Scotland. The Townsend shaft at Port Dundas is said to be 468ft. high, and to be the highest in the world, the chimney of the St. Rollox Chemical Works being 12½ft. lower. The highest American chimney is at Brooklyn, and has an elevation of 300ft. America, it will be seen, is far behind the Old World in respect of these municipal decorations.

Electric lighting in Australia has received much attention. It is a good omen for the success of the movement that the New South Wales Parliament have thrown out every Bill promoted by private companies to light Sydney by electricity, because they think that such powers ought to belong solely to the corporation. The progress of the electric light in these cities of Australia is seen by reference to a report to the Adelaide City Council by Mr. George Anderson, C.E., of that city. According to that report, the corporation of Melbourne have an Act empowering them to light the streets; the necessary buildings are finished, and the plant has arrived. The gas-lamps will be extinguished. Several hundreds of pounds are expected to be saved out of the cost of the present lighting. In all the busy streets of the city electric lights are used, besides all the principal shops and many of the public buildings. In Sydney similar progress is recorded, where the main streets, wharves, railway stations, arcades, theatres, hotels, refreshment-rooms, and shops are all lighted by electricity. All the installations are in the hands of private individuals. Brisbane has also made a beginning now: Queen-street and its shops are lighted by a private firm.

The price charged in Victoria for an incandescent light varies from 6d. in some country towns to 1s. 6d. a week in Melbourne. In Sydney the price is 1s. per week, and in Brisbane, where there is no competition, the price is 1s. 9d. per week. On the average, the price is 1s. per week or 4s. per month. This price is about the same as gas at 5s. per 1,000, for the consumers are allowed to burn the light when and as long as they like. The incandescent light is equal to 20 candles, and the gas only between 17 and 18 candles. The report further states the plant at this price would soon (between four and five years) pay for itself. As the Swan patent runs out at the end of the year, the cost of incandescent lamps will be reduced from 5s. to 1s. 3d. each. It is stated that in Melbourne they are fitting up houses and business premises at from 16s. to 20s. per light, and the fittings are said to be handsome. For cooking purposes electricity is being also largely applied, and stewpans, frying-pans, ovens, &c., need only to be connected with a wire. As a motor for ventilating smoking-rooms, offices, &c., by revolving fans, electricity is much used.

Some disagreeable incidents have occurred in relation to the Health Congress to be opened next week by the British Institute of Public Health. This gathering was arranged under the auspices of the late Lord Mayor, Sir Stuart Knill, who attended last year a like meeting at Edinburgh. Sir Stuart Knill has, however, by a formal letter, withdrawn from all participation in the forthcoming Congress, as has also Mr. W. R. E. Coles. I see it is stated also that Mr. Ernest Hart, who had accepted the post of president of the Section of Municipal and Legislative Hygiene, has resigned, and declined to read his promised paper. A like course has been followed by Sir Spencer Wells, Sir Henry Thompson, Sir C. Cameron, Mr. Fletcher Moulton, M.P., Canon Barnett, Surgeon-General Ewart, the Mayor of Brighton, and other leading persons. The County Council of London, the Sanitary Institute, the National Health Society, the Royal College of Surgeons, and other public bodies invited to send official delegates have refused to do so. The Plumbers' Company of London, which had been announced as intending to give a banquet and reception, have passed a resolution refusing to do anything of the kind, and requesting that their repudiation of any such intention may be publicly announced.

I wonder whether the inhabitants of some of our West-end squares know what they sleep on? People talk about Mr. Buggins and his soft core foundations nowadays, but really I don't think he sins much more against the light than his respectable forbears who built the squares. Take Bedford-square, for instance. During some recent excavations for foundations in the rear of the houses on the south side, cesspools and pits have been discovered in joyous proximity, and whole cartloads of bullock's heads and horns have been unearthed. Was there a murrain, I wonder, in London in the days when Bloomsbury was unbuilt on, and were the condemned cattle buried *en masse* beneath the soil on which afterwards were erected the 18th-century mansions that our fathers not so long since vacated for South Kensington?

CHIPS.

Excavations are being made in the precincts of Peterborough Cathedral, by permission of the dean and chapter, with a view to tracing any existing remains of the original Saxon monastery which stood on the site of the present cathedral. A portion of the old Saxon church was discovered under the pavement of the south transept during the restoration of the centre tower of the cathedral.

At the meeting, on Monday, of the Halifax School Board, the plans prepared by Mr. F. J. Walsh, of that town, for the enlargement of the Mount School, at an estimated cost of £3,000, were adopted.

St. Thomas's Church, Stockport, was reopened on Saturday, after extensive alterations. The ceremony began with the dedication of a clock with four dials and a peal of bells, presented as a memorial, and this was followed by the dedication of a new baptistery, a memorial window to the late rector, and other new work.

The latest report by the Board of Trade states that, as a whole, the building trades are scarcely so well employed as before, and local disputes continue to disturb these trades. The percentage of unemployed members of Unions has risen from 3·3 to 3·5. The furnishing and wood-working trades show a decline in most branches, the returns of unemployed members from Unions connected with these trades giving the percentage as 4·4 compared with 3·3 for May.

The Lewis Trustees have offered to convey to the corporation of Manchester 19 acres of land at Barnes Green, Harpurhey—purchased by them at a cost of £8,000—on condition that it is laid out as a public recreation ground. The city council has accepted the gift.

A very large clock has just been erected at St. Thomas's Church, Stockport, as a memorial to the late Mr. Alderman William Smith. It has four illuminated dials, strikes the hours, and chimes the Cambridge quarters. The whole of the work has been carried out by Messrs. John Smith and Sons, Midland Clock Works, Derby.

Building Intelligence.

Ampleforth.—The foundation stone of the new monastic buildings for the community of Benedictines at Ampleforth was laid on Tuesday week. The portion of the present buildings dates from 1802. The plans provide for the complete reconstruction of the monastery, retaining only the present college buildings. The portion of which the foundation stone was now laid will contain cells for about twenty-four monks, together with the prior's rooms, calefactory and lecture rooms. In due course of time, as funds will permit, it is proposed to build the west wing at right angles to the section already commenced, and this is to contain libraries and additional cells. The probable cost of the section is estimated at about £10,000 or £11,000.

Berkhampsted.—The foundation-stone of a new chapel, a portion of the buildings now being added to Berkhampsted School, was recently laid by the Countess Brownlow. The extension will face Castle-street, and will include, besides the chapel, chemical and physical laboratories and a lecture hall. The chapel, which forms the centre feature of the new quadrangle, is to be Late Perpendicular in style. The walls are faced externally with Leverstock red bricks, with windows, doors, and arches of Bath stone. The roof will be covered with Staffordshire tiles. Internally the chapel will measure 100ft. by 25ft., and will provide accommodation for 320, in addition to a choir of 40. A feature of the building will be the great height of the chancel floor, which is approached by a flight of 12 steps, extending nearly the whole width of the chapel. This will afford space underneath for large vestries. At the south-east corner will be an octagonal stair turret, to give access to a western gallery, whenever that may be needed. There are two short double transepts, one built over the choir vestry, and the other over part of the western cloister. The chapel will be lighted by ranges of three-light traceried windows of varied design, by a large west window, and a seven-light window over the reredos. The roof will be open-timbered, with richly traceried principals over the chancel steps and sanctuary. The nave will be laid with wood block flooring, but for the sanctuary steps and floors Devonshire marbles will be used. The chapel and vestries will be heated by hot water. A flèche will rise over the intersection of the transepts and the chancel roofs. The cloister, on the western side, will extend to the new laboratories and lecture room now building, and give access, under cover, to the gymnasium. The lecture room, which stands between the chemical and physical laboratories, measures 36ft. by 24ft., and will have a raised gallery to accommodate 120 students. The physical and chemical laboratories are each 26ft. by 24ft. They are all lighted from the top by gable windows and dormers in the roof. The buildings are being executed from the designs and under the superintendence of Mr. Charles H. Rew, of Great Berkhampsted. The general work is being executed by Mr. David Osborn, of High-street, Berkhampsted. The masonry work is being done by Mr. F. Martin.

Central Foundation Schools of London.—The new wing which has been added to the Cowper-street Schools, City-road, was opened last week. The work has been carried out from the designs of Messrs. Chatfeild Clarke and Son, at a cost approaching £3,500. Towards the outlay on the fittings a grant was made by the London County Council. Sir Henry Roscoe, in declaring the new building open, said he had seen a great number of laboratories all over England and on the Continent, but he had never visited any better fitted for the purpose in view than theirs.

Coxlodge, Newcastle-on-Tyne.—A commencement has been made with the enlargement of the Newcastle City Lunatic Asylum at Coxlodge. When the extension has been completed, the accommodation at the asylum will be doubled. The work now in progress in connection with the enlargement consists in the formation of the foundations, the construction of which has been intrusted to Mr. Ferguson, contractor, of St. Mary's-place, Newcastle. The cost of the foundations alone is estimated at from £9,000 to £10,000, while the total cost of the new building will not run far short of from £80,000 to £100,000. The architect is Mr. Dyson, of Grainger-street, Newcastle, whose plans were selected in competition.

Holborn.—The Duke of Bedford laid on Tuesday the foundation stone of the new public library to be erected in High Holborn. The site is situate on the south side of High Holborn at its junction with New Oxford-street. It adjoins the offices of the Board of Works for the St. Giles district, from which authority the freehold was purchased for £3,000. The site has a frontage of 37ft. on all the floors except the ground floor, where the frontage is 27ft., with a uniform depth of 57ft. It abuts on a passage known as Green Dragon-yard, from which light can be obtained to the rear portion of the premises. The building will contain on the basement a boys' reading room, assistants' room, bookbinders' workshop, and storage; on the ground floor, a newspaper room, with a superficial area of about 820ft., and a lending and reference library. The elevation towards High Holborn will be faced with Ancaster stone. The cost is estimated at £6,440. Mr. W. Rushworth is the architect, and Mr. W. Boyce the contractor.

Kilkeel.—On Tuesday week the foundation-stone of a new Presbyterian church was laid at Kilkeel, Belfast. The style of the structure will be Gothic, and the entrance will be at the west end through a vestibule running along the front, pierced by three pointed arches forming an arcade. The tower rises from the north-west. The building will seat 200 persons, and the cost has been £2,000, including vestry and session-room at the east end. The architect is Mr. David C. Salmond, of Cardiff.

Metropolitan Asylums Board.—Messrs. A. and C. Harston, 5, Leadenhall-street, on the recommendation of the committee, have been appointed architects for the imbecile infirmary, to accommodate 1,320 patients, which it is proposed to erect on the Tooting Lodge Estate. It was also agreed to adopt the plans prepared by Messrs. Pennington and Son, architects, for the erection of five two-storied pavilions for fever and diphtheria patients, and one block for isolation cases at the North-Western Hospital. These six pavilions, which will accommodate 226 patients, at a cost of £43,500, will take the place of the existing temporary wards erected nearly twenty-five years ago, and now in a very dilapidated condition. The construction of the fifth or lowest ward will be deferred pending the settlement of the plans for the proposed ambulance station adjoining the hospital.

Newfoundland.—By a disastrous fire the fine cathedral at St. John's, Newfoundland, only erected eight or ten years before, was totally destroyed by fire in July, 1892. The building had a nave and aisles of six bays, Early English in style, and a square-ended choir of four bays, this portion being of fully-developed Decorated character. Both were designed by Sir Gilbert Scott, modified since his death under the direction of his son, Mr. Gilbert Scott. Great efforts are being made to rebuild it, but funds are low, and a debt of about £10,000 still exists upon the destroyed building. The rebuilding of the choir is so far complete, however, that it is hoped by the end of the present year it will again be ready for service. The re-erection is being superintended by Mr. J. W. Wills, originally of Totnes, who represented the late Sir Gilbert Scott, R.A., during the building of the original structure. An offering has just been made for the choir by Mr. John Withers, the organist of Newfoundland Cathedral. It is a large and massive eagle lectern, standing over 8ft. high, with a platform for the reader. All is carved in English oak, and is a replica of the original lectern designed by Sir Gilbert and consumed in the conflagration. The completed work left Exeter for its destination across the Atlantic last week, having been made in the studios of Messrs. Harry Hems and Sons, at Longbrook-street in that city. The original cathedral was illustrated in the Building News of September 18 and October 30, 1885.

Sheffield.—The members of the Sheffield Society of Architects and Surveyors met at the new Town Hall, on Monday, at the invitation of the architect (Mr. E. W. Mountford, of London), to be shown over the building. The plans and details were explained, as well as the materials and the manner of using them. There was a number of visitors, who were divided into parties and conducted over the building respectively by Mr. Mountford, the architect; Mr. Scales, the clerk of works; and Mr. Robson, the contractor's manager. Many questions were asked, and freely answered, and the various arrangements and details of the building were commended. A sample of one of the inside doors, which had been set up in oak, attracted considerable attention, and the hope was expressed on all hands that the City council would adopt it and the other items suggested for the permanent improvement of this building, which should be a credit to the city. It would be a source of regret afterwards to find that, for the sake of a false economy, this fine building had been spoilt for a comparatively insignificant saving. Mr. C. J. Innocent, hon. secretary, proposed, and Mr. Joseph Smith seconded, a vote of thanks to Mr. Mountford and his staff. Mr. Mountford, in responding, remarked that, with respect to the items which he had suggested for the internal finishing of the building, it had been stated as a reason for not adopting them, that to do so would be unfair to the other architects who competed; but he had to-day, from Mr. Gibbs and others, that such was not the view of the architects of Sheffield. The building was thoroughly British, from the steel of the joists to the marble decoration of the walls.—Operations are now proceeding rapidly. The Surrey and Norfolk-street portions of the building are nearly complete, so far as the outer work is concerned; satisfactory progress is being made with the Council Chamber section, and the erection of the front in Pinstone-street, where nothing has been done for a considerable time, is to be at once resumed. The contractor has now about 200 men engaged, and of these about 80 are masons. The work has been retarded in consequence of the scarcity of masons. At no time have the services of a sufficient number been obtainable, but the contractor now hopes that the Surrey-street part of the building will be finished by the end of the year.

CHIPS.

A new mission-room at Bridge-street, Tredegar, was opened on Sunday. The builder was Mr. David Morgan, of Tredegar.

Ford Madox Brown's cartoon of "The Body of Harold brought to the Conqueror," a canvas 15ft. by 13ft., which was submitted at the competition for the decoration of the Houses of Parliament in 1844, has been presented by a committee to the South London Fine Art Gallery in Peckham-road.

Herr Bruno Piglhein, the well-known German painter, died at Munich on Sunday. The deceased, who was born at Hamburg in 1848, studied sculpture in that town and at Dresden. He subsequently visited Italy.

Alterations are being made to the Fever Hospital, Neath, including the ventilation, which will now be carried out on the Boyle system, the latest patented improved form of self-acting air-pump ventilator being adopted for the extraction of the vitiated air.

The Western Schools, North Shields, for the Tynemouth School Board, are being warmed and ventilated throughout by means of Shorland's patent Manchester stoves and patent Manchester grates, the same being supplied by Messrs. E. H. Shorland and Brother, of Manchester, the patent Manchester stoves previously supplied to these schools having proved very satisfactory.

The Bible Christian chapel trustees have appointed Mr. J. W. Trounson, of Penzance, their architect for the enlargement of the society's chapel premises, at Madron, Cornwall.

The Bill of the London, Brighton, and South Coast Railway for duplicating their line between Croydon and Redhill has passed through all stages in both Houses of Parliament.

The last of the important picture sales of this season took place on Saturday, at Christie's, when the collection of Caroline, Duchess of Montrose, was brought to the hammer. The prices realised did not range high, the most noteworthy ones being 4,400 guineas for Reynolds's portrait of Mrs. Mathew, the patroness of Flaxman, and 3,100 guineas for a portrait of Madame Le Brun, by Gainsborough. The pictures realised £15,422, and the porcelain and china a further sum of £1,283.

A new stained-glass window, which has been placed in the chancel of St. John's Church, West Bromwich, was dedicated on Sunday. The window forms one of a series representing the burial and resurrection of Christ. The work was executed by Mr. S. Evans, of West Smethwick.

The small prayer-book of Queen Elizabeth, bound in gold and enamelled, previously in the Barclay Field collection, has been acquired by Sir A. W. Franks, who has permanently lent it to the British Museum, to be placed in the Gold Room.

Correspondence.

THE TOWER BRIDGE.

To the Editor of the Building News.

Sir, — Your correspondent "A. R. I. B. A." may be a very eminent architect, and an equally eminent engineer; but, inasmuch as I have watched the construction of the Tower Bridge from the commencement, have most of the available literature and published drawings of the work, and also taken a deep interest in its progress and completion, his assumption that I am not at all conversant with my subject suggests an impertinence which perhaps he did not intend.

If, however, he will do me the justice to carefully re-read my letter, which from his remarks he does not appear to have done, and will then take the consensus of opinion of the Art section of the Institute under whose initials he shelters himself, I think he will find that the conclusion to which they will come is that the engineering spoils the architecture.

If this does not satisfy him, he may then go to Great George-street, and ascertain the views of the Civil Engineers, and I think he will find that their verdict will be that the architecture spoils the engineering.—I am, &c.,

Ellis Marsland, Hon. Sec.

Society of Architects, St. James's Hall,
Piccadilly, W., July 13.

PRESENT COMPETITIONS.

Sir,—I beg to draw attention to the two following competitions recently advertised in your columns. The conditions of the competition for a public hall and offices, &c., at Cleethorpes, state that the cost is not to exceed £2,000. The accommodation required, as set forth in the instructions, will necessitate a building containing at least 200,000c.ft., which, at 6d. a cubic foot—a very moderate estimate for this class of building—will amount to £5,000. The sum mentioned in the conditions does not allow quite 2½d. per cubic foot, a price at which it is obviously impossible to erect a building of the kind required.

The second case is that of the Weston-super-Mare market competition, the conditions of which state that the cost of the building is not to exceed £4,000, and the first premium of £30 will merge in the architect's commission, which is to be five per cent. on the amount of the contract, and to be payment in full for all the usual services, including travelling expenses, &c. The architect is also to provide a bill of quantities, for which no further remuneration is offered. The five per cent. commission would amount to £200, about one-third of which, say £60 to £70, would probably go in office expenses, a further £50 or £60 in travelling and hotel expenses (for a London architect, or one at any similar distance), and two per cent., or £80, in quantity surveyor's fees, leaving no profit whatever, nor means of livelihood for the successful (?) architect, to say nothing of the out-of-pocket cost, inevitable in all open competitions, to the profession generally, or those members of it who are misguided enough to complete under such conditions.

Can nothing be done to prevent such unfair treatment of the architectural profession, besides the obvious remedy one has in one's own hands of not going in for such competitions?—I am, &c.,

July 12. A Would-Be Competitor.

COMPETITION FOR THE LLANDUDNO MUNICIPAL BUILDINGS.

Sir,—On behalf of the architects who sent in designs for this proposed new building, may I ask you to insert this letter in your paper?

I suggest that some inquiry be made of the Improvement Commissioners as to what they propose to do in this matter. The designs were sent in on the 31st of May, and it is not unreasonable for the competitors to expect an assessor to be appointed and give his award within six weeks of the delivery of the designs.

If report is true, the several packages of designs are still at the offices of the Commissioners untouched, and, for the matter of that, unthought of. I think the Commissioners should be reminded of their duty towards the architects who have spent at least a month or six weeks of their time, probably with their staff, in preparing these designs, which is no small matter.

It is difficult for a competitor to take any steps personally, and, therefore, the only thing for him to do is to write to the Press.—I am, &c.,

A Competitor.

ASSISTANT SURVEYORS, WAR OFFICE.

Sir,—As an examination for the above has been officially announced, and you were good enough last year to allow assistant surveyors to air their grievances, I trust you will permit me to again warn intending candidates, perhaps more precisely, of what they must expect in the service.

The clause, "each successful candidate will accept his appointment subject to the express condition that the staff of the Department is liable to reorganisation from time to time, as the interests of the public service may require, and that no claim for compensation on his behalf can be admitted if such reorganisation shall in effect reduce the number, or alter the conditions of superior appointments in the Department," was introduced in the year 1893, after numerous complaints from gentlemen who entered the service previous to that date with definite conditions held out to them concerning the reduction of the standard numbers of the upper classes from 11 for the first class and 22 for the second class to 9 and 18 respectively.

The insertion of this clause was tantamount to admitting a real grievance; but the authorities have persistently refused to recognise it, and have definitely taken away from the majority of these gentlemen the ultimate prospect, under the original strength of the staff, which was unreservedly held out to them, of reaching £500 a year. Such conduct in an individual employer would be questionable; but the military authorities are aware how Quixotic it would be for individuals to go to law with the Crown. Military officers are bound by the legal decision laid down in the Manual of Military Law that "every officer in the army is subject to the will of the Crown, and can be removed and put on half-pay or dealt with as the Crown, with a view to public convenience, thinks best"; but these gentlemen, as civil servants, did not thus place themselves unreservedly at the mercy of the Crown; the new clause cannot be retrospective in their case, and I doubt whether it can be legally applied to any civil servants. It is, therefore, the duty of the civil authorities, who are paramount, to take a proper legal opinion in the matter as to whether these gentlemen should not be compensated for their very substantial losses. Such a serious matter should not be decided by the military authorities, who, as military men, are prejudiced by their own military law, which is not applicable to civilians. I hinted last year that appeals do not always reach the Secretary of State for War, so that the public Press is the only medium through which these gentlemen can obtain a hearing and place the matter before public opinion.

Presuming no further reduction of the superior appointments takes place, under the present conditions an assistant surveyor would take about 18 years to rise from the bottom of his class into second class, and another 12 to reach the first class, or 30 years in all to reach the ultimate prospect of £500 a year. If he enters at 25 years of age he will never reach that prospect, and if at 21 years of age he may enjoy it for four years.

The reduction of the staff is due to the fact that the R.E.'s created quartermasters—who do not perform the duties of quartermasters—for the Department, with the object of ousting surveyors; and to satisfy the Treasury it could be done without expense, they do it at the expense of the surveyors. The cutting down has not ended, as this year's estimates only provide for 17 second-class surveyors as against 18 for last year. The dawn of a better system is being suppressed, and the object of the Playfair Commission is about to be defeated; the R.E.'s, for their own ends, are endeavouring to drift back into the old system of nominating those who will suit them—the old system which has brought barracks into such a state of discredit that it is now necessary to expend £4,000,000 to place them in a proper condition. The R.E.'s have shown the Government a cheap, but perhaps not a straightforward, way of getting a superior class of men to compete, and should it lose this class, and another 70 years of R.E. sway require another £4,000,000 for the same purpose, both they and their quartermasters will prove dear at the price.

Colonel Dawson Scott, R.E., said before the Commission of 1887 that a first-class surveyor was necessary for the Dublin district, and a second-class surveyor for the Cork district. Why does a second-class surveyor now work the former district, and an assistant surveyor the latter? Has the work grown less arduous in the face of the great expenditure on barracks in these districts?

Why are temporary men employed at a higher remuneration than those of the permanent staff? Have they proved satisfactory? I think not. An inquiry into the expenditure on barracks would reveal very strange matters.

Now that I have shown the drift of affairs, I revert to the treatment the successful candidates will have to undergo.

They must come prepared to find the officers under whom they are placed calmly appropriating their work and signing for it, without doing anything themselves. They must expect scarcely any leave of absence, as they will have to make up for work accumulating during that time; there is no reserve of surveyors to take their places for the time being. They will find themselves excluded from the society of gentlemen, and will be treated in the light of non-commissioned officers by commissioned officers, as they are influenced by the R.E.'s; the latter adopt this policy to prevent the true state of affairs from leaking out. They will not be able to repress the undue familiarity of non-commissioned officers. If they enter barrack rooms they will be subject to any remarks Tommy Atkins may think fit to make, and his language is not choice if he has first stood to attention, and then finds he has made a mistake in so doing. They will be subject to many moves from stations; some surveyors have been moved three times in one year. This is expensive for married men, who may lose £60 for one shift. When ordered on foreign service they must pay the passage of their families, which may see them £150 out of pocket. In the colonies their isolation will be complete, for in such places English society is influenced by military officers, who will not hesitate to traduce them to the civilian element. If married, their wives will be left severely alone. A more perfect system could not be invented to develop any inherent weakness of character, such as melancholia, drink, or general recklessness.

I endured the system for many years, and as candidates are not fully warned of the true state of affairs, I venture to do so with the hope of sparing some gentlemen a great deal of future pain and disappointment.—I am, &c.,

One Who Was In It.

VENTILATION OF SEWERS.

Sir,—Amid the many fallacies on sanitary matters which we read of from time to time, it is refreshing to see that at last some light is breaking into the theories of medical officers of health and of sanitary surveyors, as shown by Dr. F. W. Clark's report on the "Ventilation and Flushing of Sewers," noticed in the Building News of 13th inst. Dr. Clark appears to me perfectly correct when he maintains "that the less the movement of the air of sewers, the fewer disease germs that will be carried into the outer air." One might have thought that common sense would have suggested this years ago. How these germs get into the air of sewers is not so obvious.

Nägeli, of Munich, and Dr. Carnelly, of Dundee College, showed that micro-organisms do not quit water for the air above it, and there is not the smallest shadow of proof that they are carried up by bubbles of gas. It is by the assistance of dried particles of sewage, which hang to the sides of the sewer manholes and edges of surface-gratings, when detached by currents of air during the so-called ventilation, that the atmosphere is polluted.

It is a mistake to suppose that the air from sewer gratings or ventilating shafts is immediately dissipated on entering the atmosphere. It is not so until its specific gravity and velocity become nearly that of the air through which it is passing. During some London fogs, persons on the footpaths of the streets opposite ventilating gratings may be seen enveloped in a cloud of moist, warm air, which has escaped from the sewer, and which hangs about for a considerable time. The same, I have no doubt, occurs on the roofs of houses to which are attached ventilating pipes from the sewers. The sewer-air, charged with disease germs, would then find its way under the slates, and foul the water-cisterns usually placed under the roof.

It is now admitted by nearly all competent authorities that enteric—*i.e.*, typhoid—fever is caused by living organisms, chiefly located on the glands of Peyer in the intestines. Eberth and

Gaffkey have described what they considered the organisms causing enteric fever to be, and they are conveyed from the patient to other human bodies by the bowel discharges getting into the food, either solid or liquid, or possibly into the mouth directly from the atmosphere, and from thence into the alimentary canal. Is it not therefore common sense to suppose that the most effectual way to prevent infection is to seal up the bowel discharges after they have left the patient, or by destroying them directly in an incinerator; or, if passed into a sewer, that it shall be so closed as to prevent the possibility of any fæcal matter finding its way again into a human body? Unfortunately, the practice of most persons calling themselves sanitary engineers is directly the opposite to this, for with the assistance of the wind and induced currents of air, they do their best to evaporate the sewage into the atmosphere. A practice of over thirty years in sanitary engineering under the Government, and a study of bacteriology long before nine-tenths of the present medical officers of health knew even what the name meant, enable me to pronounce the system of ventilating sewers into the streets or by shafts up the sides of dwelling-houses as pernicious, and that it deserves severe condemnation, for, to my own knowledge, cases of enteric fever have been traced directly to this cause.—I am, &c., J. T. Hurst,

Late First-Class Surveyor, War Dept.

PARLIAMENTARY NOTES.

A Statue of Cromwell.—Mr. Everett asked the First Commissioner of Works whether he could arrange to add a statue of Oliver Cromwell to those of the other historical personages whose statues now enriched the precincts of the House.—Mr. H. Gladstone: The statues erected at the public expense in the Palace of Westminster were, generally speaking, selected in pursuance of recommendations by the Fine Arts Commissioners. In their fourth report is a list of distinguished men recommended for selection by a committee of that body, who included Cromwell in a separate schedule of names for which they were not unanimous. William III. was put in the same category; but his statue has since been placed in Westminster Hall. Probably hon. members would be glad to see a statue of Cromwell, equestrian or otherwise, within or in the neighbourhood of the House. There is no money at present available for this purpose, but I shall be glad to consider the matter.—Mr. Darling asked whether the statue of this eminent man was omitted from the list because he was an owner of racehorses.

Dyce's Frescoes.—Sir J. Goldsmid on Friday last asked the First Commissioner of Works whether he was aware that Dyce's frescoes in the Queen's robing room were in very bad condition, and that steps should be taken to prevent further decay, and whether he would appoint a small committee of experts to advise him upon the subject.—Mr. H. Gladstone said his attention had been called to the condition of the frescoes and other paintings in the Houses of Parliament, and he was now in communication with Sir F. Leighton on the subject.

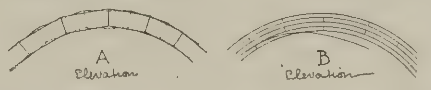
London Streets and Buildings Bill.—This Bill came before the House of Commons on Monday, when it stood for consideration after having been dealt with by a hybrid committee. Mr. Stuart moved that certain standing orders be suspended, and that the Bill be taken into consideration. Mr. Howell moved the rejection of the measure, on the ground that its subject matter ought to have been dealt with in a public rather than a private Bill. An exception to the general rule ought not, he considered, to be made in favour of the London County Council, if only for the reason that any who were prejudiced by this Bill could obtain redress only by the costly machinery of private Bill legislation. In the committee this Bill had been shorn of some of its worst features. As it was introduced, the Bill would have given the County Council power to make by-laws irrespective of the provisions of the Bill itself. Mr. Stuart Wortley and Mr. Cohen joined in the appeal that this Bill should not be further delayed. Mr. Shaw Lefevre thought it would be a great pity if this Bill, after all the labour devoted to it, were rejected. The amendment was negatived, and other amendments, proposed by Mr. Weir and Sir Charles Dilke, having been withdrawn, the Bill was read a third time.

A new hydropathic establishment is being provided at Askern, Yorks, where two large buildings, formerly used as schools, are being converted for the purpose, so as to accommodate between 50 and 60 visitors. Alderman B. Stocks, of New-street, Huddersfield, is the architect of the institution, which was formally opened by the Mayor of Huddersfield on Saturday.

Intercommunication.

QUESTIONS.

[11181.]—**Wood Beam.**—Which is the stronger method of constructing a wood beam, built up as at A or laminated as at B?—Lufia.



Legal.

COMPULSORY COMPENSATION.

THE Lands Clauses Acts provide for the payment of proper compensation to those parties whose property is taken from them under the compulsory powers of some statute and for public purposes. In a recent case (*Times*, June 19), the London School Board had taken over the house of a solicitor named Scard, living and practising at 48, Blackheath-road, Greenwich, of which premises he held a lease. In his claim he asked for £250, the value of the remainder of his lease, and a substantial sum for loss of business by removal, which, however, had been reduced as the claimant had been able to secure another house in the same street before his case came on before the Sheriff. He also put in a special item for loss of access to the river. The Under-Sheriff left as questions of value upon which the jury should give their verdict: the leasehold interest in the old premises; an agreed sum of £25 for removal and readjusting his office; then loss of business by being disturbed and having to go elsewhere; and, finally, loss of access to the river as one of the amenities of his old residence. In the result the jury found a verdict for £523 in one lump sum and without saying in any way how it was made up.

The School Board now came to a Divisional Court practically by way of appeal, but formally to set aside the whole inquisition, becauee there was no way of saying how far the verdict was wrong, as the amount was not divided. If any portion of it was erroneous, the whole finding must be quashed. The Court held that the sum allowed for the loss of the remainder of the lease of the premises included any compensation that could be claimed for loss of access to the river. This could not be allowed twice over. As to the lease, it was only for 14 years, 13 of which were unexpired, at a rental of £40. One side said this was its full value; the other that it was worth £50, so that there was a loss of £10. As to compensation for loss of business, there had been little evidence of that, and it could not be said to be very serious, as he had obtained another house in the same street. But on the ground that the Under-Sheriff was clearly wrong in leaving the item of loss of access to the river as a distinct head of damages instead of including it in the loss of the lease, the Court had to set aside the whole verdict, as the sum could not be divided. As a result, unless compromised, the inquiry must be heard over again, and all costs incurred so far are wasted. Fred. Wetherfield, Solicitor.

1, Gresham Buildings, Guildhall, E.C.

Note.—All questions for reply in this column must be headed "Building News," and must reach my offices, as above, by *Tuesday* morning to insure answer same week.

J. W.—Agreement.—Validity.—The agreement is perfectly valid though continued on separate sheets of paper fastened at the corner. But if this course is adopted, it is better to initial each sheet when signing at the end to prevent subsequent dispute. Wills, even, are often engrossed in this way, and then each page should be signed.

The alterations at York Cottage, Sandringham, which include the addition of several new bedrooms and a complete set of nurseries, are now almost complete. Col. Edis met the Duke of York there on Wednesday for the purpose of advising as to the character of the furniture to be used.

Major-General Crozier, R.E., held an inquiry, at the Council House, Bristol, on Tuesday, into an application by the city authorities for power to borrow £37,500 for works of wood-paving in the principal streets of the city. Messrs. F. Ashmead and T. H. Yabbicom gave evidence in support of the proposal.

LEGAL INTELLIGENCE.

What is a New Street?—Bethnal Green Vestry v. Button.—Mr. Justice Mathew heard on Monday an action brought by the Vestry of St. Matthew, Bethnal Green, to recover £162 from an owner of property for the paving of Dagnall-place, E., under the provisions of 18 and 19 Vict. cap. 120, section 105, and 25 and 26 Vict. cap. 102, section 112. The defence was that Dagnall-place was not a "new street" within the latter Act, and that the vestry had taken it over by doing work. For plaintiffs, it was contended that in 1856 the street was sewered by the parish, who also did whatever was necessary to reinstate the street whenever the gas or water companies had occasion to open it up. The street was never paved; but in 1867 a Mr. Munday was appointed surveyor, and without any authority caused some cobbles to be laid down. It was submitted that this was not evidence—that the street had been "taken over before August, 1862." Mr. George Bainbridge, examined, said he was connected with the vestry from 1856 to 1866 as surveyor, and previously under his father, who was also surveyor. No work was ever done by the vestry in Dagnall-place, as it was always considered private property. Mr. Barratt, the present surveyor, William Stone, the road foreman, and Timothy Crawley, a paviour in the vestry's service since 1856, gave evidence. For the defendant, it was argued, first, that Dagnall-place was not a "new street," and secondly, that the vestry were estopped by Mr. Munday's act in 1867 from making any claim now. Mr. Reuben Button, the defendant, said he had known the place since 1846. He bought his property in 1861. It was a thoroughfare until 1862, when it was closed with the vestry's permission. As far back as 1856 he could remember the street being rough paved with cobbles. In 1861 the vestry paved the channel at their own expense. Mr. Justice Mathew, in giving judgment, said the defence had been made out, and there must be judgment for the defendant, with costs.

A Building Question.—The St. George's Local Board v. Ballard.—This case was tried before Mr. Justice Lawrance at Bristol, and on Saturday last he gave judgment in it. Mr. Justice Lawrance said that the defendant was the owner of some houses in Providence-place, Church-road, Bristol, in front of which was a footpath 8ft. wide, and in addition a plot of land which was formerly used as garden ground by the occupiers of the houses in Providence-place. The defendant proposed to build three houses upon this land, and for the plaintiffs an injunction was asked to restrain him from so doing, upon the ground that to do what he proposed to do would be to infringe the by-laws of the board. One of these said that any person who should make a new road of more than 100ft. long should be bound to provide a carriage road 33ft. in width. The question was whether what defendant proposed to do amounted to constructing a new road within the meaning of the by-law, and, upon the facts proved at the trial, he came to the conclusion that it did not, and, therefore, that the plaintiffs were not entitled to the injunction they asked for. Judgment for the defendant with costs.

In re James Smith, Bankrupt.—This was a sitting for public examination before Mr. Registrar Linklater on Tuesday, under the bankruptcy of James Smith, described as a potter, of 50 and 51, Lime-street, City, and also of the Canal Potteries, Old Kent-road, trading as "Thos. Smith and Co." The accounts showed gross liabilities £92,499, of which £52,310 were expected to rank, with assets estimated to produce £28,858. The debtor attributed his failure to want of capital from the beginning of his trading necessitating borrowing money at interest, but the Official Receiver states that it appears to be mainly due to losses and liabilities on accommodation bills, loss on trading, and to his drawings for household and personal expenditure. In the course of his examination the debtor stated that the business was originally established by his father, and was formerly carried on under the style of the "Original Lambeth Potteries" at an address then known as Princes-street, Lambeth. His father died in 1854, and some years subsequently he entered the business as manager on behalf of his mother. The premises were eventually taken over by the Board of Works, and the Thames Embankment was constructed on the site. About that time he entered into partnership with his brother, Thomas Smith, and they carried on business at the Canal Potteries, Old Kent-road. The capital of the firm was £10,300, comprising chiefly borrowed moneys, he introducing £1,200 only. The partnership continued until 1883, when it was dissolved, the debtor paying a certain amount to his brother's creditors, and agreeing to allow him £5 per week. He then took over the business as a going concern, and became liable for all the debts of the firm. No statement as to the position of the business was made out at the date of the dissolution, but the liabilities had all been discharged. No valuation of the business assets had been made since he first joined the concern, and no statement of affairs had been prepared. At the date of the dissolution it was estimated that he had a surplus of assets on paper of £6,500. He had never introduced any more money into the business; but from the time he commenced he experienced the want of further capital. Throughout his trading he had dealt with accommodation bills, and for many years past the business had been kept going by them; and during the past five or six years he had become very deeply involved in such dealings. The Assistant Official Receiver: Is it not a fact that your accommodation bill transactions during the 25 months preceding the date of the receiving order amount to no less a sum than £369,042? The debtor admitted that it was so. His accounts now showed £54,000 to be outstanding in respect of bills, of which only £4,154 represented bills accepted by himself. These transactions were carried on in connection with about twenty persons, who were mostly his customers. For the purpose of running these bills, he opened about five or six different banking accounts.—The Assistant Official Receiver: Did you inform the managers of the banks of the use you intended to make of the accounts?—The debtor said he gave them the list of his acceptors, and told them to make their own inquiries. He did not, in fact, tell them at the time the accounts were opened that the bills were accommodation bills.—The Assistant Official Receiver pointed out to the debtor that the bills included shillings and pence, and asked him whether these odd amounts were not inserted for the purpose of leading the banks to believe that they were all trade bills?—The debtor denied this to be the case, and explained that no doubt the shillings and pence were added because a particular sum had to be made up.—The Registrar: I thought that would be the answer. There is no doubt they were put in with a view to sharing the plunder.—The debtor objected to the word "plunder." — The Registrar: I call it "plunder" when you obtain money from banks upon bills without informing the managers that they are accommodation bills.—At this point the case was adjourned until Tuesday next.

District Surveyors' Powers —Mr. A. J. Hacks, builder, of Dalston-lane, was summoned at the North London Police-court on Wednesday, at the instance of the London County Council, as the owner of a temporary building and workshop abutting on Sylvester-road, Hackney, which the district surveyor had certified to be in a dangerous condition. Mr. Godfrey represented the Council. Mr. Legg, the district surveyor, said that the defendant was building in Sylvester-road, and a temporary erection he had put up as a workshop and store had been partially destroyed by fire. The remaining portion of the building was charred to such an extent that it might fall at any moment. The defendant, who seemed indignant at being summoned, said it was not a building, and Mr. Legg's "jurisdiction" did not extend to it.—Mr. Bros: Why?—Defendant: Because it is not in a public thoroughfare; it's in a private road.—Mr. Bros: I may tell you that his jurisdiction extends to a dangerous building anywhere. Defendant: I suppose, then, if I put up a clothes-prop which was three inches out of the perpendicular, he could compel me to take it down.—Mr. Bros: Don't make absurd remarks. This is a building.—Defendant: It's four props.—Mr. Legg: With a roof on them.—Mr. Bros: I shall make an order for you to take down the building, in accordance with Mr. Legg's directions, in three days.—Defendant: Then he will have to take it down himself.—Mr. Bros: And you will have to pay what it costs.

STATUES, MEMORIALS, &c.

Bristol —The statue of Edmund Burke, presented to the city of Bristol by Sir W. H. Wills, Bart., will be unveiled by Lord Rosebery on September 19. Its location will be on the north side of St. Augustine's Bridge, where the foundation has already been constructed, and the contract for the pedestal has been let to Messrs. W. H. Cowlin and Son, of Bristol. The statue is of bronze, and has been executed by Mr. Havard Thomas on the island of Capri, and cast by the cire perdue process at Naples. It is between 9ft. and 10ft. in height, and represents Burke in the act of addressing an audience, with the right arm raised, and the hand open. The head is uncovered, and the hair is worn long.

WATER SUPPLY AND SANITARY MATTERS.

Redruth Waterworks.—Formal sanction has been given by the Local Government Board to the loan of £9,500 for improving the water supply to the town of Redruth. A provisional order has been obtained for the acquisition of the necessary land for the storage reservoir. The engineer to the scheme is Mr. H. Bertram Nichols, C.E., of Birmingham, who is engaged by the local board to carry out the works.

* * *

M. Jules Sainton, the Parisian portrait painter, died on Sunday, aged 64 years.

Our Office Table.

The foundations of the New National British Gallery, in the Grosvenor-road, Millbank, are now level with the roadway. Much difficulty was experienced in getting out the concrete foundations of the old penitentiary, on the site of which the gallery is being built; but now that this has been surmounted, there is nothing that is likely to retard the future progress. A broad flight of steps will lead to the main entrance, the treatment of which will be brought out in strong relief by pavilions at each end of the building. Over the central sculpture hall will be a massive dome. The gallery will be practically finished in about two years, but sufficient ground has been acquired at the rear of the building to carry out a great extension if the trustees think it necessary. The gallery will have practically only one floor, so that top-lights can be secured in all the rooms, but a basement floor will be constructed for storage purposes. One of the principal features of the interior will be the huge central hall, to be devoted to sculpture, and its architectural appointments are likely to make it one of the finest specimens of its kind in London. It is just possible that the galleries will not be provided with any system of artificial lighting, as it is not thought desirable to open them of an evening.

The second annual meeting of the National Society for Checking the Abuses of Public Advertising was held last Friday, Mr. Alfred Waterhouse in the chair. Sir F. Leighton, who was unable to be present, wrote sympathising with the spirit which animated the Society. Mr. Bryce, Professor Foxwell, Sir Henry Thompson, and others had also written expressing sympathy with the objects of the society. The annual report, read by Mr. J. Richmond, one of the hon. secretaries, admitted that one class of disfigurement which the society desired to abate had in reality increased. Nevertheless, the council believed that progress of a substantial kind been made towards the ultimate accomplishment of the desired reform. Their efforts had at least made the regulation of spectacular advertising a public question. They did not, of course, take any credit for the welcome and most valuable declaration made by Lord Rosebery at the Academy banquet regarding the growing danger to English landscape, but it was hardly presumptuous to believe that the Prime Minister would not have made a public profession of his faith and his fears if they had not done something to prepare the atmosphere for the discussion of the topic as one of great urgency. Mr. Wyndham, M.P., moved the adoption of the report, and strongly supported the attitude of the society, which was one of attack against a growing evil. Mr. Fawcett seconded the motion, remarking that unless a check were put upon the growing evil, they might expect to see a sky-sign on Skiddaw and advertisements of pills on the dome of St. Paul's.

A proposed national trust for places of historic interest or natural beauty was discussed at a meeting held in Grosvenor House on Monday. Resolutions were carried deelaring it desirable to form a body which could hold such places on behalf of the nation, and authorising steps to be taken for its legal incorporation. A provisional council has already been formed, and a board will be constituted, consisting of councillors nominated by various bodies representative of the universities, the trustees of the National Gallery, the Royal Academy, and other councillors elected by the members of the association. Among those present were Sir Robert Hunt, Sir Frederick Pollock, Lord Carlisle, Lord Stanford, Mr. Watts, R.A., Mr. Poynter, R.A., and Miss Octavia Hill.

The terms of the Budget Bill have been revised, under pressure from Sir John Lubbock and others, so as to permit the Treasury to remit the Estate duty or any other duty in respect of any pictures, prints, books, manuscripts, antiquities, or scientific collections as appear to the Treasury to be of national or historic interest, and have been bequeathed for national purposes or to any university, county council, or municipal corporation. This modification of the duties is in accordance with common sense.

The town council of Dumbarton have under consideration the desirability of applying to the War Department for the custody of Dumbarton Castle. The matter is causing considerable commotion in the old burgh, and opinions differ as to whether or not the council would gain very much suppose they were owners of the rock and castle, while members of the county council of Dumbartonshire, at their meeting this week, frankly expressed their conviction that, negligent custodians as the Government have proved to be, the burgh authorities would prove even less amenable to public opinion. Most of the buildings are said to be in a dilapidated condition, and unfit for habitation, and that the expense of repair would be more than they are worth. This is said to be the real reason why the Government do not make further use of the castle.

The congress of the British Institute of Public Health begins on the 26th inst. The congress will be divided into five sections. In the first, "Preventive Medicine," there will be discussions on the spread of diphtheria; the dissemination of disease by river water, on which Professor Frankland, Dr. Shirley Murphy, Dr. Louis Parkes, and others will speak; the aërial diffusion of smallpox; school sanitation and hygiene; and workshop inspection, on which Mr. J. B. Lakeman will give an address. In Section B, "Chemistry and Climatology," there will be an exhibition of meteorological instruments and the apparatus used in food analysis, and discussions on air pollution, the bacteriological examination of water, adulteration, and sewage purification; and Section C will be "Municipal and Parliamentary," and among the speakers will be the Earl of Meath, Cardinal Vaughan, and the Hon. Auberon Herbert on "Municipalities and Popular Recreation," while the Chief Rabbi, Dr. Adler, will explain "Jewish Methods of Meat Inspection." Section D will deal with "Engineering and Building Construction," among the subjects being electric lighting, refuse and sewage disposal, and the construction of hospitals and artisans' dwellings. Section E will discuss "Naval and Military Hygiene." The opening meeting will be held in the Guildhall, when the Lord Mayor will attend, and Professor Smith, of King's College, medical officer of the School Board for London, will be inducted as president for the year. The sections will afterwards meet at King's College. Among the features of the congress will be the laying of the foundation-stone of the new hospital at Shooter's-hill, which is to be the largest fever hospital in the world; an inspection of the drainage and ventilation arrangements of the Houses of Parliament; and an exhibition of the work of the London School Board, including the instruction of the blind, dumb, and mentally defective.

The battle of the necessary dimensions for the projected reservoir on the Nile is proceeding merrily. Mr. W. Willcocks, the Director-General of reservoirs under the Egyptian Government, has written a long letter in reply to Mr. Hamilton Lang's strictures on the Assouan scheme, in which he gives details and figures to prove that his estimate of the irrigation requirements of Egypt were not exaggerated. He argues that to meet the needs of Lower Egypt at least a million and a half centimètres of water per day would be necessary, and that the quarter of a million centimètres of water suggested by Mr. Lang as adequate would simply be lost in the river between Assouan and Cairo, and never reach the Delta. He contends that according to the estimates of Mr. Brown and Mr. Foster, the Inspectors-general for Upper and Lower Egypt respectively, the annual yield of the land in Egypt will be increased by £12,000,000 if the full quantity of the water required is stored.

The library and museum of the archæological section of the Midland Institute, at Birmingham, have recently acquired some valuable local works. A collection of sketches and water-colour drawings, chiefly of local subjects, has been bequeathed by the artist, the late Mr. Allen E. Everitt. Miss Elizabeth Lines, of Worcester, has recently presented a unique and highly interesting collection of plans and drawings of earthworks, camps, and prehistoric stone monuments illustrating the early settlements in Wales, and the conquest of the western portion of this island by the Romans. These are the original sketches made by the late Mr. H. H. Lines, the donor's father. Mr. Wright Wilson, F.R.C.S., has enriched the library with some of the early volumes of "Archæologia," and the museum with proof impressions of Westley's engravings of Birmingham, six pieces of ancient Dutch stained glass, formerly in one of the windows of a Warwickshire church; and a series of forty medal dies, which cost upwards of £10,000, and are chiefly the work of Birmingham artists. They were prepared for the medals struck in 1820 by Sir Edward Thomason for James Mudie, of London, in commemoration of the chief British achievements from the settlement at Bombay in 1662 to the placing of the Ionian Islands under British protection in 1817.

It has often been suggested that public bodies should endeavour to arrange to have the internal painting of the buildings under their charge executed in the winter time, so as to provide employment for workmen during the months when work is usually slack. Nothing could be more desirable, provided reasonable precautions were taken to maintain a fair temperature in the rooms, and that the interests of the ratepayers did not suffer, as the members of this and other building trades are in excessive demand during a few months, followed by a long dull season of inactivity. The chairman of the Salford School Board stated, however, on Monday, that they had tried to make such an arrangement; but an inspection of the tenders sent in had, however, disclosed the fact that for the winter work the tenders were from 5 to 10 per cent. higher than the summer prices. Consequently, the Board have decided to adhere to the usual practice of having the work at all the schools done during the summer holidays.

* * *

The local board of Farsley have finally adopted plans by Mr. Walker, C.E., for the sewering of the district.

The Estates Committee of the Birmingham City Council have resolved to recommend the council to take over the closed churchyard of St. Paul's, Birmingham, for the purpose of a public recreation ground. The cost of fencing and laying-out the ground is estimated at about £2,600.

One of the subjects of competition at the recent Eisteddfod at Carnarvon was the best design for a workman's cottage and outbuildings, suitable for an allotment of three acres, the cost of the buildings not to exceed £180. The successful competitor was Mr. H. Williams, of Liverpool.

Trade News.

WAGES MOVEMENTS.

Building and Allied Trades.—According to the *Labour Gazette* for July, the engineering and metal trades, owing largely to their unsettled condition on the north-east coast, show a decline, the percentage of unemployed in unions connected with these trades having risen from 8·3 to 9·0. The shipbuilding trades have remained practically stationary, the percentage of unemployed in the unions concerned having only fallen from 13·3 to 13·2. On the whole, the building trades are scarcely so well employed, and local disputes continue to disturb these trades. The percentage of unemployed members of unions has risen from 3·3 to 3·5. The furnishing and wood-working trades show a decline in most branches, the returns of unemployed members from unions connected with these trades giving the percentage as 4·4, compared with 3·3 for May.

Edinburgh and Leith Slaters' Wages.—A request having been made by the operative slaters of Edinburgh and Leith to the employers for an advance of ½d. per hour on the present rate of wages, the employers have unanimously agreed to grant it, the advance to take place on August 1. The standard wage will then be 8½d. per hour.

Huddersfield.—The strike and lock-out in the building trade at Huddersfield terminated last Friday. On the previous Wednesday, the General Builders' Association suggested that if possible an arrangement should be come to, and on the Thursday the Masters' Association determined to open their yards next day. This was assented to by Messrs. Radcliffe and Sons, as the Doncaster Operative Masons had agreed that the worked stone there and that in Messrs. Radcliffe's yard at Huddersfield should be used in the buildings being erected by the firm at Doncaster, and that the remainder of the stone might be machined at Huddersfield. Messrs. John Radcliffe and Sons also agreed that the hand labour should be done at Doncaster. These terms the Operative Masters' Lodge decided to accept, and work was begun in the afternoon of Friday last in the various yards. The Operative Masons' Lodge intend to use their influence to get the rule which prohibits the importation into one town of stone worked in another town expunged; but this cannot be done until next year at the meeting of the Revision Committee of the Operative Stonemasons' Society of England, Ireland, and Wales.

CHIPS.

The annual meeting of the Guild and School of Handicraft will be held at Essex House, Mile End-road, E., to-morrow (Saturday) afternoon. Sir Albert Rollit, M.P., will preside and deliver an address. The report will be presented by Mr. Walter Crane.

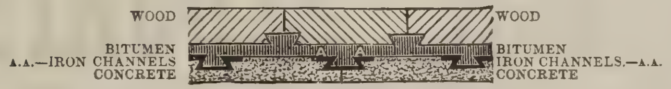
The half-yearly report of the Manchester, Sheffield, and Lincolnshire Railway Company states that arrangements have already been made for the acquisition of a large portion of the requisite land for the London Extension Line, and the contracts in connection with this important undertaking will be let at an early date, after which the works will be immediately proceeded with and prosecuted as rapidly as possible.

The memorial-stones have been laid of a new chapel which is being built in New-street, Bloxwich. The chapel is designed to accommodate about 300 worshippers, and is estimated to cost about £700. It is designed by Mr. H. E. Lavender, Walsall, is being built by Mr. S. Wootton, and will be a solid and substantial structure of brick, with stone dressings in front.

HAM HILL STONE.
The attention of Architects is specially invited to the Durability and beautiful Colour of this material.
Quarries Well Opened; Quick Despatch Guaranteed; Stonework Delivered and Fixed Complete. Samples and Estimates Free.
Address:—
THE HAM HILL STONE COMPANY,
NORTON, STOKE-UNDER-HAM, SOMERSET.
London Agent:—
Mr. E. A. WILLIAMS, 16, Craven-street, Strand, W.C.

BILLS OF QUANTITIES & PLANS.
T. PETTITT and CO. Lithograph Bills of Quantities with the greatest expedition. Accurately copied from the draft in clear hand. Orders from the country returned by evening mail on the same day. Terms on application. Also Plans of Building Estates and General Plan Work at very reduced prices.—T. PETTITT and CO., Lithographers, 28, Frith-street, Soho, London, W. Established 50 years.

14 GOLD MEDALS. HIGHEST AWARD, CHICAGO, 1893. 14 GOLD MEDALS.
Ebner's Patent Hydrofuge Wood Block Floors.
Telegraphic Address:
EBNERS, LONDON.
Code: UNICODE.



INSPECTION OF SHOW ROOMS INVITED.
ANY WOOD OR DESIGN USED.
JOS. F. EBNER'S PARQUET FLOORS, ANY THICKNESS OR DESIGN.
JOS. F. EBNER'S ROMAN AND VENETIAN MARBLE AND GLASS MOSAIC PAVING.
JOS. F. EBNER'S IMPROVED MARBLE TERRAZZO PAVING. ARTISTIC, CHEAP, AND DURABLE.

TENDERS.

₊ Correspondents would in all cases oblige by giving the addresses of the parties tendering—at any rate, of the accepted tender; it adds to the value of the information.

ABERCARNE.—For works of scavenging during one year, for the Abercarne local board:—

Abercarne district—	
Lewis, R., Abercarne (accepted) ...	£550 0 0
Newbridge district—	
Powell, Evan (accepted)	399 0 0

ACTON, W.—For repairing and painting at the Priory Board Schools, for the Acton School Board. Mr. Edward Monson, jun., F.R.I.B.A., Acton Vale, W., architect:—

Hooper, G., Acton, W. (accepted) ...	£27 10 0

ACTON, W.—For alterations to latrines, &c., at the St. Mary's Board School and All Saints' Board School, for the School Board for Acton. Mr. Edward Monson, Jun., F.R.I.B.A., Acton Vale, W., architect:—

	St. Mary's.	All Saints'.
Bray, F., Acton ...	£78 10 0 ...	—
Hooper, G., Acton ...	54 0 0 ...	£48 0 0
Ferris Bros., Acton* ...	45 0 0 ...	40 0 0

* Accepted.

BRISTOL.—For alterations to Nos. 41, 42, and 43, College-green, Bristol, for Messrs. Jolly and Son. Mr. R. Milverton Drake, Bristol, architect:—

Cowlin and Son (accepted)... ...	£1,500 0 0

BROCKLEY.—For erecting and completing the boundary wall of the Brockley Cemetery, for the St. Paul's Deptford Burial Board. Mr. John Jas. Downes, 11, The Parade, Lewisham High-road, architect:—

		A.
Oldman	£298 0 0 ...	—
Frampton	274 0 0 ...	£0 15 0
Holloway	270 0 0 ...	0 16 6
Soper	259 16 6 ...	0 15 6
Ling	252 0 0 ...	—
Schofield	240 0 0 ...	0 14 4
Hubble	240 0 0 ...	0 14 0
Johnson (accepted) ...	238 0 0 ...	0 13 6

A.—For the extension of the wall, price per foot run.
All of Deptford.

BUCKHURST HILL.—For building two cottages at Buckhurst Hill, for Mr. John Appleby. Mr. E. Brown, Fleur de Lys-street, Norton Folgate, architect:—

Kiddle, J. V., and Son	£515 0 0
Salt, S	471 0 0
Wells, W.	450 0 0
Arber, A. H.	399 0 0
Cannon, D.	357 0 0
Daniells, W.	255 0 9

BURHAM, KENT.—For alterations to the girls' and infants' departments at the board schools:—

George, R., Burham	£134 6 0
Naylor and Son, Rochester	113 0 0
Willford, of Snodland (accepted) ...	99 9 6

CAMBERLEY, SURREY.—For house, for Mr. A. E. Sidford, M.S.A., Wokingham, architect. No quantities. Part materials supplied:—

Spear and King, Crowthorne ...	£1,499 10 0
Seward, J. B., Wokingham ...	1,450 0 0
Murrell, G., Blackwater, near Camberley (accepted)	1,219 15 6

CARNBREA.—For erection of Sunday school at Pool, Carnbrea, R.S.O., for the United Methodist Free Church. Mr. Sampson Hill, Redruth, architect and surveyor:—

Roberts, J., Pool	£226 0 0
Stoneman, J., Pool	220 0 0
Nicholls, A., and Son, Redruth ...	208 0 0
Pooley, E., Pool (accepted)	196 0 0

CLAPHAM.—For the erection of the Clapham Common branch of the London and South-Western Bank, for the directors. Mr. E. Gabriel, 42, Old Broad-street, E.C., architect. Quantities by Messrs. G. R. Tasker and Sons, 38, John-street, Bedford-row, W.C.:—

Prior, W. A.	£6,350 0 0
Garrett and Sons	6,325 0 0
Higgs, F. and H. F.	6,296 0 0
Scharien and Co.	6,296 0 0
Gould and Brand	6,292 0 0
Smith and Sons	6,275 0 0
Carmichael, J.	6,118 0 0
Tennant and Co.	6,094 0 0
Young and Lonsdale	6,071 0 0
Godson and Sons	5,956 0 0
Shepherd, W....	5,948 0 0

CLAPHAM.—For the erection of three shops in High-street, Clapham, S.W., for Mr. S. G. Budd. Mr. E. Gabriel, 42, Old Broad-street, E.C., architect. Quantities by Messrs. G. R. Tasker and Sons, 38, John-street, Bedford-row, W.C.:—

Scharien and Co.	£5,056 0 0
Tennant and Co.	4,962 0 0
Smith and Sons	4,905 0 0
Gould and Brand	4,814 0 0
Godson and Sons	4,807 0 0
Garrett and Co.	4,800 0 0
Prior, W. A.	4,700 0 0
Higgs, F. and H. F....	4,680 0 0
Carmichael, J.	4,645 0 0
Shepherd, W....	4,619 0 0
Young and Lonsdale	4,442 0 0

CUBERT.—For erection of board school at Cubert, for the Cubert School Board. Mr. Sampson Hill, Redruth, architect and surveyor:—

Julian, J., Truro	£743 0 0
Rodliff, T., Cubert (accepted) ...	628 0 0

DORSET.—For the erection of a police-court at Kinson for the Dorsetshire county council:—

Huxtable and Co., Bournemouth (accepted) ...	£1,641

EDINBURGH.—For the erection of Broughton School, for the city school board. Mr. Wilson, architect:—

Gerard, W. (accepted)	£20,146 0 0

EDINBURGH.—For the enlargement of Causewayside School, for the city school board. Mr. Wilson, architect:

Currie, Adam (accepted)	£778 0 0

GOWERTON.—For the erection of intermediate schools, for 70 boys and 50 girls:—

Thomas and Watkins (accepted) ..	£3,000 0 0

[Lowest tender received.]

HENGRAVE.—For erecting a laundry at Hengrave, Bury St. Edmund's, Suffolk, for Mr. John Lysaght. Mr. R. Milverton Drake, 24, College-green, Bristol, architect:—

Building:—	
Linzell, H. J., Newmarket	£559 0 0
Machinery:—	
Manlove, Alliott, and Co., Limited, Nottingham	207 0 0

THE BUILDING NEWS
AND ENGINEERING JOURNAL.
VOL. LXVII.—No. 2064.

FRIDAY, JULY 27, 1894.

THE PRACTICAL AND THE IDEAL ARCHITECT.

THERE are two sides to everything. When the educational is being thrust so prominently forward, that the public hardly knows which is the more desirable equipment for the architect—a large acquaintance with theory or practical experience—it seems opportune to take a glance at the state of the architectural market at the present moment. People nowadays are apt to look only on one side of a man's attainments or qualifications, and to ignore the other side, as if both his experience and his knowledge were not equally necessary. In the case of the architect, this bias has had a very unfortunate effect on the profession by tending to divide it into two—the practical and the artistic—and the schemes of examination that have been put forward have rather served to increase this view of laying stress on a particular line of studies. The modern architect is a multiform creature. At one time he was supposed to be a master of the highest traditions of the building art, and knew everything appertaining to his vocation according to the Vitruvian model; but now he is supposed to be either an artist or a constructor, a designer or a building expert, an architect in the narrowest sense of the term, or a business man. A recent writer in the *Engineering Magazine* of New York distinguishes a variety of types of the profession founded on their natural aptitudes. He enumerates—the "successful" architect, the "sensitive" architect, the "engineer-architect," the "soured architect," the "bad architect," the "advertising architect," and the "school man," each of which varieties he describes; but these are rather accidental than real divisions of the subject. In this country we can distinguish four well-marked species. There is, for example, the man whose time is taken up in the drawing-office, whose idea of the architect's avocation is designing on paper, who is largely engaged as a draughtsman in assisting architects in competition work and otherwise. Many of these men have won prizes and distinctions at the Royal Academy School, or at the Institute of British Architects, as Soane Medallionists or Travelling Studentships. Accomplished as draughtsmen, they readily obtain employment in the offices of leading members of the profession, whose time is taken up by practical work. Then we have another well-known class of men, who have devoted their energies to mastering some branch of construction, like ironwork or sanitary work, who have perhaps written books on the strength of materials, or sanitary matters, on concrete work, or on some particular kind of building. They are perhaps more often theorists than practical men. Under the term "practical" may be included a large number of the rank and file of the profession, men who have been trained on buildings as clerks of works or surveyors, and who know a great deal more about the trades of building and general superintendence than of design. Lastly, we have a few whose inclination and studies have been chiefly "academic," who have studied at the Ecole des Beaux Arts of Paris or the Royal Academy, and have given themselves up largely to the literary and artistic branches of the profession. These four, the draughtsman, the constructional or scientific, the practical, and the academic, are well-marked varieties of the genus-architect. To bring these branches together, to unite them for the interest of the public and the profession must be the main object of any educational system. At present each represents a useless force. The practical man can do little without the draughtsman or the designer. Again, the latter is powerless in carrying out important buildings. Instead of these four separate factors, each working for himself in his own way, the object should be to combine these forces to bring their separate functions into action in our buildings. We may never make the born artist a thoroughly practical man, but we can, by directing his studies at the beginning, make him a constructive artist. The English system of education, which favours the apprenticeship method, seems to many to give the best results, as it subordinates the academic study to the practical work in the office of the architect. Both the French and American methods are different, and to a certain extent perhaps faulty. The French student receives his training at the Ecole des Beaux Arts. Traditions for a time obtain a mastery over him, his taste is directed by an æsthetic code which cannot be disputed, and when he begins to practice, this academic and æsthetic training directs his motives, and gives him largely-conceived views of plan and design. The American student begins also in the architectural school, and then goes into the architect's office to learn the practical details of his business. These two distinct methods of study have each some merit. The English system appears more in accordance with the training of the architect in the old times. The latter is essentially a modern method of making the architect, in which the academic course comes before the practical. A good deal may be said about the advantage of teaching art to the young and impressionable student before setting him to work on practical building problems. On the contrary, it is argued by many that early academic influences are captivating, and draw attention away from prosaic details—that academicism tends to stifle originality of thought, and make men copyists.

The school and the workshop are irreconcilable unless they are simultaneously used. In some remarks on the methods of architectural education in vogue in America, in the *Engineering Magazine* these two principles have been discussed, and we briefly refer to them. One writer, Mr. Arthur Rotch, on the French School of Fine Arts, shows the influence of the *Ecole* on American architecture. "It is distinctly," he says, "to the Beaux Arts at Paris, and its direct influence through pupils, or indirectly through the schools in America which have followed its lead, that the splendid buildings in its own chosen style at the World's Fair were erected." The same writer, speaking of the best way to fit an architect for his career, observes the broader the foundation laid for it the better; the most liberal is the best. Experience alone can teach the multitudinous details; but "there is another kind of knowledge which is not picked up in practice, and whose absence experience only emphasises. There are whole ranges of subjects which can be learned only from the professor or in the academic laboratory, and these studies, which stimulate investigation and train the judgment, are not to be found in the most extended practice." Chemistry, heating and ventilation, and other branches can be learned expeditiously only under a professor. The short road is necessary when so many subjects have to be learned, and this is why the author thinks a certain degree of academic training is needed to round out an architect's education, even if he can learn the æsthetics of planning and design in the office. A school discipline enables the student to grasp the bewildering facts and conditions of modern building problems. When brought face to face with such structures as business premises, railway stations, baths and wash-houses, his mind stored with æsthetic principles and a code of laws, enables him to avoid the crude guesses and conclusions of the untrained constructor. Hence, we find the academic method of architectural education has been able to cope with problems of a difficult kind. The American system is based on the Parisian system, where Classic and Gothic models have been instilled into the mind, and where traditions at first, as Mr. Rotch says, submerge personality, and enable the student to lay hold of immutable principles. Though every man has his own idea as to style, he has a larger grasp of plan, and we know that, for symmetrical design, the Ecole des Beaux Arts student has no rival. The influence of this school, it is said, "always makes for a large symmetrical treatment of masses, and a subordination of details in the composition." This system has found general favour. Those who have studied in the French capital and return to the States have acquired this mode of design, even if they rarely adopt French models.

If we turn to the practical method of instruction which is exemplified in the young man turned out of the busy architect's office, and whose opportunities have been spent on buildings, we shall find also much that is good, but a want of direction in his artistic studies. Unless he keeps himself well up in his theoretical acquirements, by attending classes and lectures and reading, he is apt to lose sight of the possibilities of his art, and to be outdone by the academic or the mere draughtsman. And yet his practical training is the most natural one, and will give him undoubted advantages in practice over his other rivals. He follows also nearer than the others the method of the Middle Ages; he is in daily contact with the building and the workmen. The modern problem is, then, how to combine the two, the school and the office—in other words, theory and practice. At present the schemes of our would-be educators have not been a great success. For an articled pupil or architect's assistant to spend a few hours a day or evenings a week in listening to lectures and attending classes is to furnish him only with a quantity of undigested knowledge of facts. The school classes and the technical workshop do not bring him nearer the object of real education. He is still far from the realities of his vocation. He thinks and designs on paper, assisted by books and photographs, and rarely sees the actual building. The schools that give instruction in architecture to the student are without the equipment of practical details. Another writer, Mr. R. D. Andrews, on architectural education for America, has tersely put the matter. He complains of the present unfortunate conditions of practice. The system of paying architects on a commission basis makes it necessary, he says, to secure a larger amount of work. "The money premium is set on quantity not quality, and the result is the architect becomes primarily an organiser, a hirer of draughtsmen, a man of affairs. The designer designs, the constructor constructs, the superintendent superintends, and the architect busies himself with administration and his clients." The superintendent, the only person who is brought into contact with the actual work, is the one person who is considered least worthy to design. We have here the gist of the matter. The separation of design from execution has been the weak points both in English and American architectural practice. To bring the architect closer to his work, paying him a certain sum for his services, instead of a commission, is a feasible suggestion we have before advocated, and we believe that every school for theoretical instruction should be in connection with workshops, where the student could learn the application of the principles he had acquired, bringing the architect and workmen together, and so profit by each other's attainments. No school of architectural education can be complete without facilities for the instruction of the student in the use of building materials and practical design, and for enabling him to work out problems which are of daily occurrence in buildings. The school and the office or workshop must be brought together, and the question still remains—How the reconciliation and their co-operation can be best effected?

EVASION OF BUILDING LINES.

IN carrying out the provisions of the Metropolis Local Management Act, 1862, technical objections, based on particular interpretations of the sections, are often raised. These frequently have reference to the meaning of certain words. Thus, for example, in sect. 75, the Act above named states: "No building, structure, or erection shall, without the consent in writing of the London County Council, be erected beyond the general line of buildings in any street, place, or row of houses, &c., &c." We can hardly conceive the terms "building, structure, or erection" to mean any other than what those words ordinarily signify. Yet there are people who would apply those terms to any single portion of a structure, such as a wall, and they would do this for the purpose of avoiding a very obvious intention of the framers of the section in respect of the general line of buildings in any street. The question, for instance, as in the following case, was "What in any particular circumstances amounted to a 'building, structure, or erection,' within the meaning of the section?" That section clearly applied to any building erected in any street, &c.; but if an owner erected only one or two walls, some considerable time before a general line was determined on, what the builder did subsequently was erecting a building, and not certainly completing one. It does not matter whether the original builder intended to build a house or shop, so long as there was no evidence of such intention before a line was established; a subsequent builder could not afterwards contend he was altering or completing a building. The case of "Wendon *v.* the London County Council," which was heard before the Court of Appeal, illustrates a case of this kind. The owner of a piece of land near Fulham laid out a road for building, 40ft. in width, called Fernhurst-road, which communicated in a direct line between other two roads. The owner deposited plans with the Vestry for the erection of twelve shops. There were no buildings on the land fronting the said road. In 1890 the owner commenced to build in accordance with the plans, and constructed, between the site and Fernhurst-road, footings for the front and flank external walls of the southernmost shops, and erected upon the footings the flank wall of the shop to a distance of 30ft. to a height of 12ft. from the level of the said road. The site of this shop was at the junction of Fernhurst and one of the other roads. The building was then discontinued, and soon became covered with rubbish. Two years after the owner erected a number of dwelling-houses, the fronts of which were erected at a distance of 30ft. from the centre of roadway, and about 10ft. back from the front of the old front wall. The owner subsequently granted a lease of the site to the appellant, who purchased the footings and flank wall, and who commenced building, utilising for that purpose the old foundations and wall of shop. He carried up the shop two stories, or about 24ft. high, which projected about 10ft. in advance of the "general line," but no portion of it was in advance of the flank wall before mentioned. He was then summoned. In March, 1893, the superintending architect decided the "general line" of buildings to be the main fronts of the dwelling houses. The magistrate ordered the appellant to pull down so much of the building as was erected beyond the "general line" of buildings in Fernhurst-road. The Divisional Court on appeal affirmed the magistrate's order, and the building owner appealed.

In delivering judgment, the Master of the Rolls defined the question as whether what was erected after the general line of buildings in the street was decided, was a "building, structure, or erection" within the meaning of section 75. Before the general line was laid down, as Lord Esher said, "part of a wall had been built to a height of 12ft. by the appellant's predecessors, and that must be taken to be the same as if the appellant had himself built it. The wall was intended to be the beginning of a shop or house. The building of the wall was discontinued for two years and a half; but inasmuch as there was no abandonment, the case must be treated as if what was done before and after the building line had been established had been done continuously. Then, was what was done after the general line was established erecting of a 'building, structure, or erection,' within the meaning of section 75? The wall was built to a height of 12ft. before the general line was established, and was intended to form part of a building; but the question was whether the wall was, as a fact, sufficiently advanced to be a 'building, structure, or erection,' within the section. The section did not prevent a building existing at the time when the line was established from being completed afterwards." After further argument, his Lordship thought the wall was not so far advanced as to be a "building, structure, or erection," within the meaning of the section. "There was nothing in the statute which said that when a building had been commenced before the building line was ascertained it might not be completed afterwards; but this wall, as a fact, was not a building within the section at the time the general line was established, and the land at that time was therefore vacant land within the true meaning of the section. If so, what was done afterwards was erecting a building, and the order of the magistrate was right." The appeal was dismissed.

The argument appears to be sound. If the statute could be construed in the way which the appellant wished, it would be no difficult matter to arrange encroachments in any new site. An owner or builder could lay the foundations of one or two walls of a house or shop on any new site before a general building line was decided, and afterwards complete the erection in defiance of the law. Section 75 does not prevent a building that existed at the time the "general line" was made from being completed afterwards. As the judge pointed out, in order to bring an erection within the section, the ground must be vacant at the time the building line was laid down; and it was virtually so in the case before us, as the wall left standing could not be said to be a "building" in any possible sense. It would be very easy for any builder to purchase the unfinished foundations of a house, and say he was completing or altering a building, structure, or erection which existed at the time a "general line" was fixed; but under this decision he will be obliged to prove that the original walls or fragments were a "building, structure, or erection" before he could claim to be exempted. The decision in the case turned on the meaning of the terms of the section, and should be another lesson to builders to be careful in the interpretation of words which have a definite meaning.

"OLD MASTERS" ON THE CONTINENT.—VII.

By CHARLES L. EASTLAKE

(Keeper and Secretary of the National Gallery).

ONE of the most distinguished painters who flourished in Italy during what is familiarly known as the *quattrocento* period was Benozzo Gozzoli. His real name was Benozzo di Lese di Sandro. Born of a peasant family near Florence in 1420, he was originally trained as a metal-worker, and is said to have assisted Ghiberti in the production of those famous gates which adorn the entrance to the Baptistery in that city. But his artistic instincts were destined to find expression in other forms of art. While still a youth he became the pupil of Fra Angelico, whom in due course he followed to Rome, where he assisted his master in decorating a chapel in the Vatican. When the Frate was summoned to Orvieto, he expressly stipulated with his employers that Benozzo should be allowed to help him in the frescoes which he was commissioned to execute in the Cathedral.

The next scene of Gozzoli's labours was Montefalco, near Foligno, where he painted for the Church of San Fortunato a Madonna and Child, an Annunciation, and various incidents in the lives of saints. These productions, which occupied him between 1450 and 1452, indicate unmistakably the influence of Fra Angelico's style of art. The same may be said of an altar-piece completed in 1456, and now in the public gallery at Perugia, representing the Virgin and four saints, in addition to many minor figures.

In 1459 Benozzo returned to Florence, where he was employed to decorate the walls of a small chapel in the building now known as the Palazzo Riccardi with frescoes, which have been selected for illustration with this article, and will be presently described.

A few years later he travelled to S. Gimignano, when he executed a series of works for Domenico Strambi, in the church of S. Agostino. Above the altar of St. Sebastian, the martyr is represented standing in prayer upon a pedestal, and clad in a long mantle supported by angels. In the upper portion of the picture the Almighty is seen launching the instruments of His wrath towards a concourse of people below, but at the intercession of Our Lord and the Holy Virgin, they are protected by the cloak of St. Sebastian. This curious picture is supposed to typify the efforts of the martyr to preserve S. Gimignano from the plague, by which it was visited in 1464. During that and the following year, Benozzo painted in the choir of the same church a series of incidents from the legendary life of St. Augustine, among which perhaps the best is that which represents the death of that saint. The churches of S. M. Magdalena and S. Andrea in the same town also contain works which bear his signature; while in the suburbs of Certaldo (where Boccaccio was born and buried) he decorated the chapel of the Giustiziati, near the Ponte dell'Agliena.

It is, however, in the Campo Santo, at Pisa, that the genius and inventive skill of this remarkable painter find their noblest expression. Nearly the whole of the north wall is covered with frescoes by Benozzo Gozzoli, illustrating various scenes from the Old Testament from the time of Noah up to the visit of the Queen of Sheba to Solomon. Notwithstanding the injuries which they have suffered from time and deplorable neglect, these large and important works are full of interest, and may be regarded not only as characteristic of the master, but as some of the most noteworthy examples of pictorial art in the 15th century. They occupied about sixteen years in execution.

It was during Benozzo's residence at Pisa that he painted for the Duomo in that city the "Apotheosis of St. Thomas Aquinas" (now in the Gallery of the Louvre), besides some minor works for churches and monasteries in the neighbourhood. His Pisan patrons appreciated his talents and industry so much, that they presented him during his lifetime with a tomb for his future burial in the Campo Santo itself. The tomb bears a Latin inscription, and the date of the donation, 1478. This led to an excusable error respecting the year of the painter's death, which really occurred much later, and probably not until 1498.

Benozzo Gozzoli's frescoes in the Palazzo Riccardi cover the walls of a dark and oddly-shaped room about 15ft. high, paved with marble and surrounded by a dado, above which the paintings are executed. The room is lighted by a single window placed at the end of a recess, so that only those frescoes which are painted on the sides of this recess can be distinctly seen. In order to examine the others, visitors are obliged to avail themselves of burnished metal reflectors provided for this purpose, and even then the inspection is attended with difficulty. The subject selected for illustration with this article is depicted on one of the main walls of the room on the spectator's right, and represents the Procession of the Magi. Towards the left of the picture, and riding alone on a white horse, richly caparisoned, is a youthful prince with long fair hair, clad in a tunic of white and gold, with red hose, and a blue cap handsomely jewelled. He is preceded on foot by a boy of singular beauty, and is followed by several attendants. On the right hand of the composition two other mounted young men ride towards the spectator. In the background is a landscape including rocks, trees, and a hunting scene, with horsemen, dogs, and game all in active motion. The costumes, horse-trappings, and other details in this fresco are elaborate, and executed with great skill. Indeed, the same may be said of all the mural paintings in this room, which, considering its peculiar plan, can hardly have been originally destined for a chapel. It has evidently undergone considerable alteration since Gozzoli's time, for the apparent purpose of widening a staircase outside.

The technical qualities of this work, the accurate and masterly drawing, and the chromatic scheme, which is brilliant but chastely harmonised, all tend to render it a characteristic and admirable example of the master. The figures in this group are somewhat less than life-size. Another portion of the cavalcade will be described hereafter.

DESIGNING OF STEEL BRIDGES, THEORETICAL AND PRACTICAL.—V.

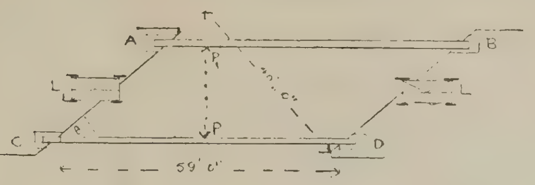
HAVING established the general formulæ for the more important instances of stress upon the flanges and web of a plate-girder, we may now proceed to make some further progress with the practical details of our bridge. The principal dimensions and data already arrived at are the following:—

Main girders of steel plate: span 60ft., depth 5ft., width of flange 1ft. 6in. Cross girders, five in number, placed 6ft. apart from centre to centre: span 36ft., depth 2ft. 6in., breadth of flange 1ft. 3in.

It is asserted that in bridges of large span it is preferable to measure that distance, not from the edges of the bedplates—that is, from the bearings in the clear—but from the centres of the bearings. Theoretically, this practice may be the more correct; but practically, it amounts to very little importance, and will be neglected in the present instance. The result of taking the span from centres of bearings is to increase it, and thus the assumption is on the safe side, as the calculations would be made, and the material apportioned, for a span a little larger than if it were measured between the bearings in the clear. There are three general items composing the total load that can come upon a bridge:—

1. The permanent dead or insistent weight of the whole superstructure itself.
2. The ordinary live loads to which the bridge may be subjected in everyday traffic.
3. Exceptionally heavy loads, to which road bridges are now considerably more exposed than in former times. The maximum exceptional load that could possibly be brought upon any road bridge could not exceed a pair of steam-rollers, the heaviest specimens of which would not surpass twenty tons each in weight, which is no light load to add to the amount already to be allowed for. So far as the main girders are regarded, this extra weight of forty tons may be considered, without any sensible error, to be equivalent to the same load uniformly distributed over the bridge. As the plate-web forms a continuous connection with the flanges, the effect of an actually concentrated load is not felt nearly so severely as if the attachments were made at long intervals, as happens when the main girders belong to the open-web type of bridge-building. Notwithstanding the advantage possessed, under certain conditions, by the open-web system, there can be no doubt that a continuous riveting-up of both the flanges and the web conduces to a greater uniformity of stress over the whole girder than is insured by the open-web principle. It is upon the cross-girders that the effect of a concentrated load is more felt, and sometimes they have to be specially designed to meet this contingency.

FIG. 6.



In estimating the total load to be provided for in the design of a bridge, each main girder is supposed to carry its share of one-half—that is, that the loading for each is regular. This is true, or fairly true, for a road bridge on the square, but not when it is on the skew, as will be seen from the diagram in Fig. 6. Let A B and C D be the main girders in a skew bridge, A, B, C, D, and let L be a rolling load advancing on the bridge. It is evident that in the position it first occupies in the figure, the whole share of the weight borne by one wheel is supported partly by the main girder A B, and partly by the abutment D B; and it is not until the rolling load has further advanced on the bridge that any weight is brought upon the main girder C D. When the load has traversed the bridge, as at L, the conditions of loading are exactly reversed, and the girder A B is in its turn relieved of all weight. Even when a bridge is on the square, it is obvious that unless the path of a heavy rolling load be exactly in the centre of the roadway, one of the main girders is more heavily strained for a time than the other. This irregular loading is of no material importance in the case of an ordinary road bridge; but the case is very different when it is a railway bridge that is concerned, and the rolling load takes the form of a locomotive weighing between seventy and eighty tons, and running at some fifty miles per hour. The effect of a load of this description in the position shown in Fig. 6, and with the *vis viva* or force of impact derived from the speed, has given rise to a good deal of discussion among engineers.

An examination of the diagram in Fig. 6 will serve to point out that during the whole passage of the rolling load the main girders A B and C D are differently affected by it. For example, let the load be supposed to be in the centre of the bridge on the line $P P_1$, in which P is the centre of the span of the girder C D, and P_1 a point near the end of the girder A B. Consequently, while the girder C D is thus strained to a maximum, the stresses on A B are of much smaller amount. There can be no doubt that when the driving wheel of a locomotive is in the position upon a bridge shown at L in Fig. 6, where the other wheel rests upon the solid abutment, a very severe local stress will be brought upon the main girder A B. As this subject is apropos to our present articles, as we shall discuss the example of a railway bridge, it is well to draw attention to this instance of unequal and irregular loading of bridges. Referring again to the rolling load L, the weight upon one of the foremost wheels rests upon an immovable support—that is, the abutment, while the weight upon its fellow is carried by a support which is not absolutely rigid and immovable. That support is the main girder, A, B, which, however strong it may be made, still deflects a little under the passing load. The inevitable result is that the foremost driving wheel upon the bridge must sink the fractional part of an inch, and a strong lurch of the rolling load towards the main girder A, B takes place. This causes a certain amount of twisting or torsional stress upon the girder depending upon the weight of the load and the *vis viva*, which gives rise to strains of deformation and even of distortion throughout the various members of the girder. In a word, the position of the normal planes in which the lines of the forces or of the external and internal resistances act is shifted, and the forces themselves no longer preserve those conditions of equilibrium which are supposed to obtain. Before leaving this part of our subject it may be observed that, in plotting or drawing the plan of a bridge on the skew, the span on the skew, as it is termed, should always be checked by calculation. The following equation connects together the three quantities, which are the span on the square, the span on the skew, and the angle of skew. Put these equal respectively to S, S_1, and θ, and we have—

$$S_1 = \frac{S}{\sin.\,\theta} = S \times \text{cosec.}\,\theta.$$

Similarly if the length of the face of the abutment on the skew be required, making W equal to the width on the square between the centre of the main girders and F, the dimension sought between the same points, then—

$$F = W \times \text{cosec.}\,\theta.$$

To this length, on the skew, must be added the corresponding value of the additional length on the square from the points already mentioned to the quoins of the abutments. This distance will depend to some extent upon the width of the booms of the main girders. If these are of a heavy description, the length of the abutments outside them must be increased. It is not uncommon, in consequence of a neglect of this precaution, to observe in some existing examples of bridges how much the quoins of the abutments, especially when built of brickwork, are jarred and shaken, and in some instances absolutely displaced. Large and deep bedstones are essential to all heavy girders, as they assist in absorbing, or partially nullifying, the effects of a heavy passing load, and so preserving from disturbance the material of the quoins of the abutments.

It is preferable, in estimating the total weight to be allowed for in designing a bridge, to make the calculations for the whole superstructure, and then divide it, to obtain the share for each separate main girder. Some engineers take the half of the separate items, and then add them together for a total; but this method does not afford so good an idea of what the whole bridge has to carry when fully loaded, and is, besides, far more liable to introduce errors into the various quantities. Our calculation of the total weight of the bridge will stand thus in tons—

Two main girders 9 tons each (trial)	18
Five cross-girders 3 tons each (trial)	15
Platform of buckled plates	9
Rolled steel joists	4
Weight of parapet screen	2
Roadways and footpaths of concrete and wood and asphalte	27
Total dead load	75

There is still a considerable difference of opinion existing among engineers and architects respecting the amount of the live load which should be provided for in the floors of both bridges and buildings. The unit of load is the weight per square foot which is produced by a dense crowd of people; and, as might be expected, there is a very marked variety in the value of this unit. It has been taken as low as 70lb., and as high as 140lb. There is no doubt that the description of bridge and also its position should be considered when treating of this important item in the live load. Many of our readers are no doubt aware of the rule relating to the congregating or massing of large crowds on suspension bridges in general, and on the example at Hammersmith in particular during the progress of the inter-University Boat-race. Disregarding, therefore, the extreme values of the unit of the live load, it may be safely taken at 120lb. per square foot of the total combined area of the roadway and footpaths, so that we have—

$$\text{Live load} = \frac{36 \times 60 \times 120}{2{,}240} = 116 \text{ tons.}$$

It has been previously stated that it is possible to have a pair of steam rollers abreast on a bridge with a clear width of 36ft. between parapets, and in these days of heavy loads and strict supervision—some people think too strict—the engineer must provide for the possible load, and not the probable, or even the improbable. In order, therefore, to bring our bridge up to modern requirements, and render it a thoroughly secure and reliable structure, a load of 40 tons must be added on to the items already enumerated. The effect of this large additional load upon the cross-girders will be investigated when their design and construction are before us. So far as the main girders are concerned, the extra load of 40 tons may be regarded as uniformly distributed over them. It is a very usual condition in competitive designs, which, it may be remarked, are not always awarded in accordance with the old Roman adage, *palmam qui meruit ferat*, to specify that special provision is to be made for concentrated loads. Now, in the great majority of cases, all these supposed concentrated loads may be treated in the manner we have stated—that is, as loads uniformly distributed.

It would not be difficult, but that our space is limited, to give a detailed calculation and working example of the two methods, the discrepancy between which would not amount to more than about 6 per cent. For the sake of this almost inappreciable difference, a large amount of useless additional labour and trouble is thrown upon the competitors, who have quite enough on their hands, without being subjected to the worry and annoyance of entering into a mathematical analysis, the equations of which terminate in an identity.

Summing up the separate items of the estimated weights upon the bridge, we have the total load equal to 231 tons, and dividing by 2, the share for each main girder amounts to 115 tons. Applying the formula given in our last article for the stress upon the flanges at the centre of the main girder—for our attention is now restricted to a single girder—we have—

$$S = \frac{W \times L}{8 \times D}$$

Substituting the numerical values already arrived at for these data—

$$S = \frac{115 \times 60}{8 \times 5} = 172{\cdot}5 \text{ tons.}$$

From what has been already stated respecting the relative resistances of steel to the respective stresses of tension and compression, neither the gross nor the net sectional area of the upper and lower flanges can be assumed to be equal, as they usually are, in designing wrought-iron girders. Although the Board of Trade fix a general limit to the tensile stress of steel intended for bridge-building at 6½ tons, yet in the Forth Bridge the material was strained up to 7½ tons, and the same comparatively high unit stress has been employed by engineers in the construction of steelwork for railways in foreign countries. If we take 80 per cent. of this maximum working tensile stress for that of compression, and 70 per cent. of it for the resistance of the rivets to a shearing stress, we shall have the following data for apportioning the amount of material in the main and cross-girders, in which the working tensile stress has been put at a little less than its maximum amount:—

1. Tensile stress, 7 tons per square inch.
2. Compressive stress, 6 tons per square inch.
3. Shearing stress on rivets, 5 tons per square inch.

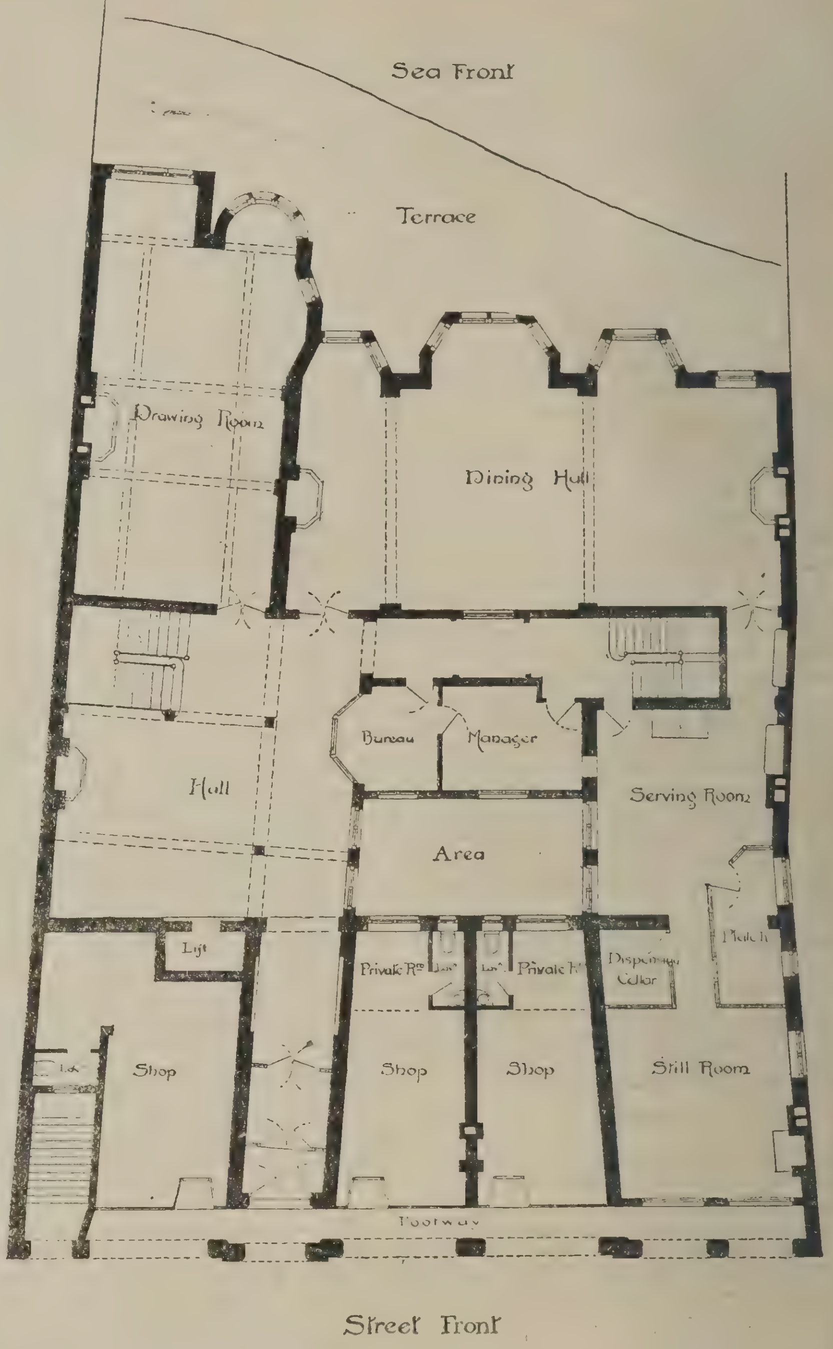
In accordance, therefore, with the value of these constants, if we make A equal to the required gross area of the upper flange, and A_1 equal to that of the lower, we have—

$$A = \frac{S}{6} = 28{\cdot}8\text{sq.in., and } A_1 = \frac{S}{7} = 24{\cdot}6\text{sq.in.}$$

We can now proceed to draw the plan and section of the two flanges, and arrange the pitch of the rivets and other practical details of the design.

* * *

The new Grand Theatre at Blackpool was opened on Monday night. It is the largest in the town, and is seated for 2,500 persons. Mr. Frank Matcham, of London, was the architect.

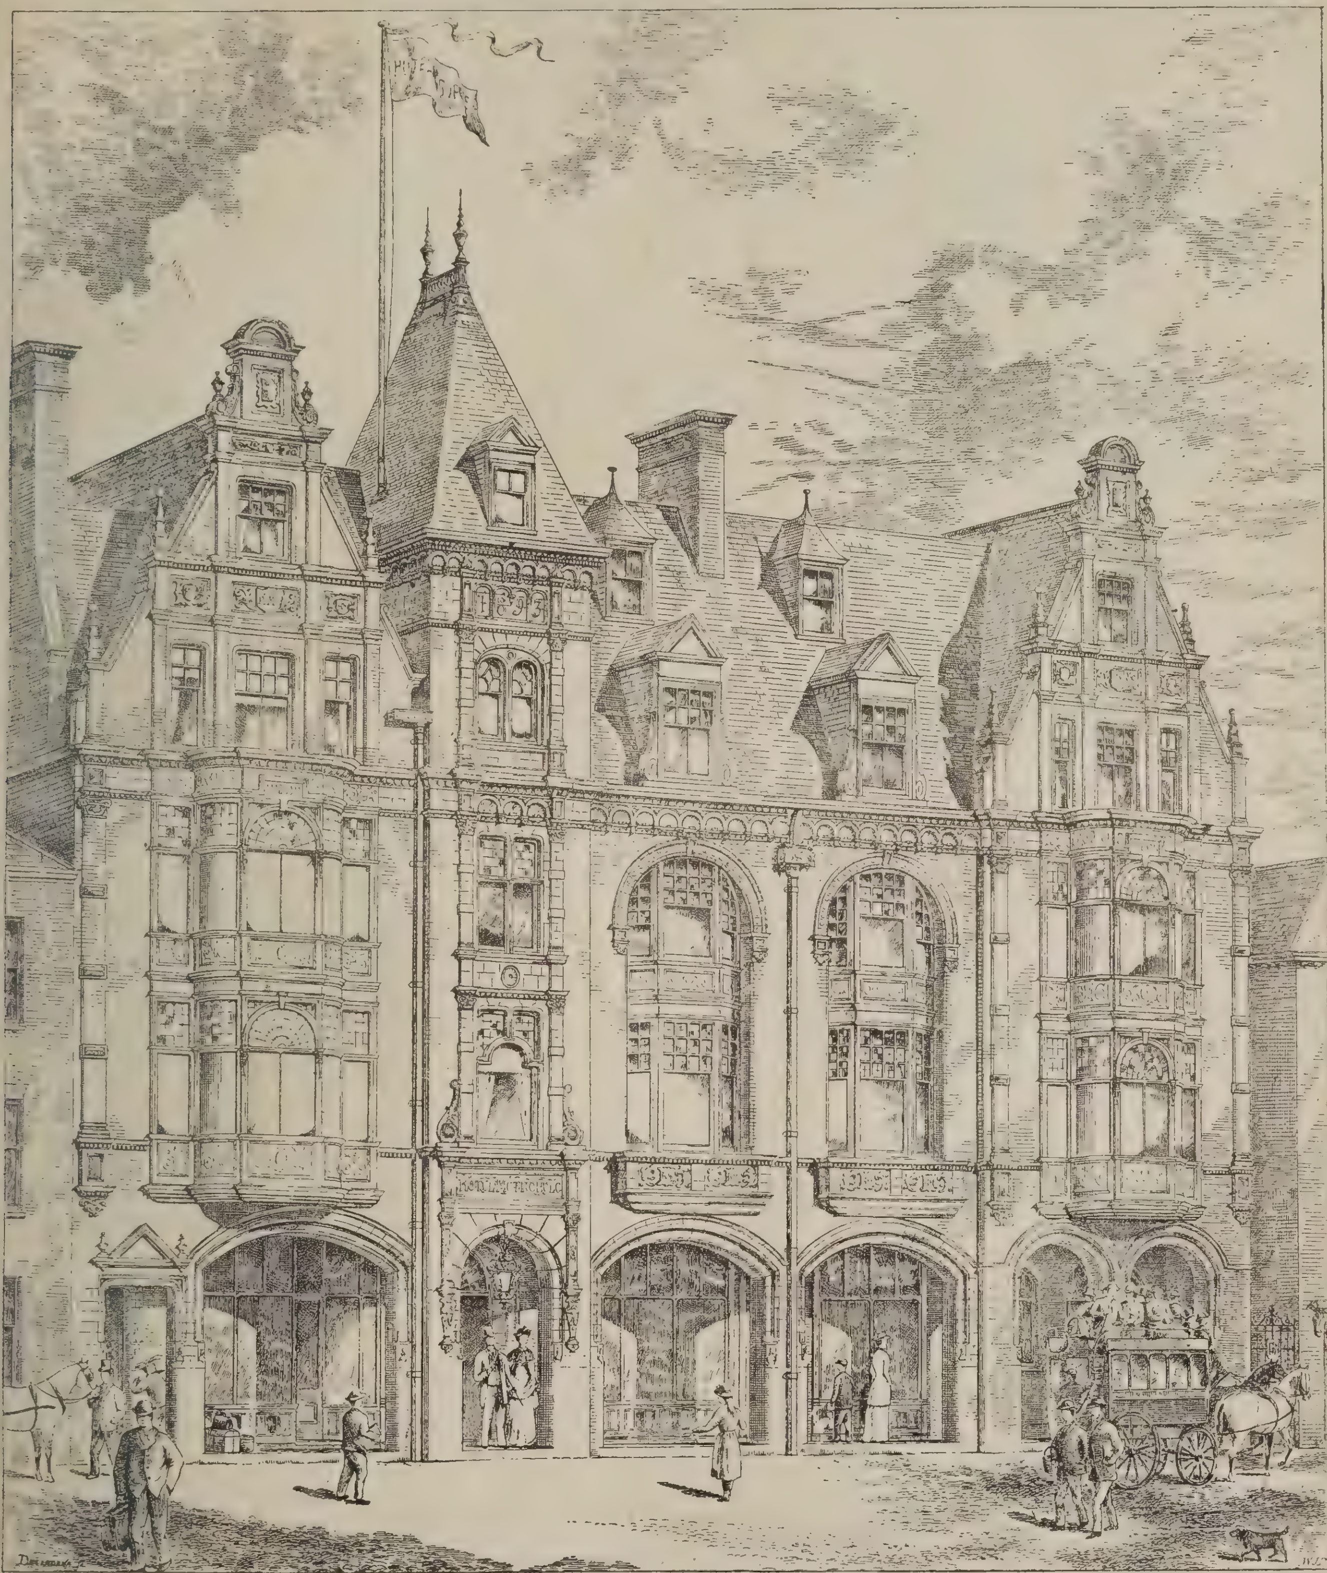


Ground Plan

HOTEL METROPOLE, CROMER.

YESTERDAY this building was opened, and to-day we publish a view of the street-front and ground plan of the building, which has been erected in a central position on the summit of the cliff facing the sea, commanding most magnificent sea views, and having direct communication through its own grounds with the promenade and beach below. A banquet was given yesterday (Thursday), to which a distinguished company were invited, to celebrate the opening, under the presidency of Sir Kenneth Kemp, Bart.

The plan indicates the general arrangement of the ground floor, which is mainly occupied by entrance hall, dining hall, drawing-room, manager's room, &c. The decorations of these apartments have been carried out in Japanese and Cordelova wall hangings. The woodwork is chiefly of walnut. The entrance hall has a canopied oak chimney-piece reaching from floor to ceiling. The staircases are constructed entirely of stone, with wrought-iron and copper scrollwork balustrading. A hydraulic passenger lift, supplied by Messrs. Waygood and Co., runs to the top floors. The natural fall of the ground allows of the billiard-room, reading and smoking-room, and private dining-room being placed under the dining-hall and drawing-room, obtaining for these rooms sea views also. The gentlemen's cloakroom and lavatory are on this floor, and so are the kitchens and most of the offices. In a basement floor are the steward's room, servants' hall, &c. The first, second, third, and fourth floors are occupied by bedrooms and private sitting-rooms, nearly all of which have been so arranged as to command good sea views. A feature of the scheme is the terrace arranged over the dining-hall, which is of easy access from the principal rooms of the building, affording an attractive resort for visitors who desire to enjoy the sea air and scenery without leaving the precincts of the building. The sanitary arrangements have been carried out on the most modern and approved principles; fire-hydrants are placed on every floor. The building has been furnished throughout by Messrs. Trevor, Page, and Co., Norwich, who also executed the chimneypieces from designs supplied by the architects. Externally the building is constructed entirely of red brick, and the roofs are covered with green slates. The decorative portions of the brickwork have been executed by Mr. G. Gunton, of Costessey, whilst the carving is the work of Mr. Minns, of Norwich. The building has been most expeditiously executed and completed by



HOTEL METROPOLE, CROMER.

Messrs. J. Youngs and Son, contractors, of Norwich. The architects of the building are Messrs. G. J. Skipper, F.R.I.B.A., and F. W. Skipper, of Norwich and Cromer, from whose plans, and under whose superintendence, the whole of the works, including the interior decorations, have been carried out. Mr. W. J. Bayes acted as clerk of the works.

THE PROPOSED NILE RESERVOIR AT ASSOUAN.

A LETTER of protest signed by a number of representatives of art, science, and literature (including Sir Frederic Leighton; Mr. E. J. Poynter, Director of the National Gallery; Professor J. Henry Middleton, Director of the South Kensington Museum; Sir A. W. Franks, President, and Mr. Hilton Price, Director of the Society of Antiquaries; Mr. Maunde Thompson; General Pitt-Rivers; Sir Henry Rawlinson; Mr. Arthur Evans; Dr. E. B. Tylor; and Dr. Flinders Petrie, Professor of Egyptology, University College, London), has been addressed to Lord Kimberley, condemning the proposed construction of a reservoir and dam at Assouan. They point out that such a high level dam would submerge the region of Nubia nearest to Egypt, and ruin the temples of Debod, Gertasseh, Tafeh, Kalabsheh, Dendur, Dakkeh, and Offa ed Dunya. It would also ruin the forts of Kostemneh and Kubban, and the towns, cemeteries, and various other remains of this region, beside leading to the ruin or removal of the various temples of Philæ. It is further pointed out that it would be impossible to utilise all the water of so great a reservoir for many years to come. Hence it would seem preferable to adopt some scheme which is capable of expansion, and which would not entail the whole expenditure long in advance of the result. It is urged that a dam at Kalabsheh would insure exactly the same benefits to Egypt; that, according to the fullest estimates of Mr. Garstin, would cost about the same amount, after fully allowing for all difficulties of construction; that the site at Kalabsheh is "geologically a good one"; that the required depth of the foundations of the dam, though presenting difficulties, would be much less than that attained in work already executed; and that, even if more immediate expense were incurred by placing a dam at Kalabsheh rather than at Assouan, the estimated profit from it is so great that the gain accruing to the country in only a few weeks would balance any additional expenditure attaching to a scheme which would have the merit of sparing the threatened antiquities.

BRITISH BUILDING STONES.—XI.

SCOTLAND (*continued*).

No.	Quarry.	County.	Geological Formation.	Description.	Colour.	Weight of a Cube Foot.		Water Absorbed per Cube Foot.	No. of Cube Feet to 1 ton.		REMARKS. Where used, analysis, crushing strain in tons per ft. super., cost per cube foot.
						Dry.	Wet.		Dry.	Wet.	
						lb. oz.	lb. oz.	Pints.	ft. in.	ft. in.	
372	CORSEHILL .. Annan.	Dumfries.	Permian *New Red Sandstone.*	Very fine-grained sandstone; little mica; bedding may be traced.	Brownish red.	128 3½	136 14	6⅞	17 5½	16 4¼	National Portrait Gallery, Very-place, Edinburgh, 1889. Cowper-street School, 1890, Edinburgh. Jews' Synagogue, Great Portland-street; St. James's Hall, Piccadilly; seven large mansions, Cromwell-road, Kensington, London; Lord Bute's mansion, Rothesay; Liberal Club, Belfast; London, Liverpool, and Globe Insurance Buildings, New York. 1s. per foot in random blocks up to 8 tons, on rail, Annan. Analysis: Silicious oxide, 95·24; aluminium oxide, ·56; iron peroxide, 1·28; calcium carbonate, 1·40; magnesium carbonate, 1·23; moisture, ·56; crushes with 372·7 to 643·0 tons (K), 341·6 to 579·6 tons (B).
373	COWGLEN ...... Dunfermline.	Fife.........	*Carboniferous. Limestone series.*	Fine-grained sandstone; a "liver" rock.	Light brown.	140 1¾	144 2½	3¼	15 11¾	15 6½	Trinity Presbyterian Church, Edinburgh; new docks, Leith. Proprietor says: "For strength, weathering, and clearness of grain, this stone is the best in Scotland or England." The rock below water mark is quarried creamy in colour, and turns a light yellow; hence the top rock must not be mixed with the bottom rock in dressings, or a patchy effect will be produced. Cube stones not exceeding 15ft. cube, and under 5ft. long, 1s. 3d.; 60ft. cube and same length, 4s. 5d.; up to 12ft. long and 60ft. cube, 6s. 4d. per cube foot. Broad stones under 10ft. super. and 6in. thick, 10½d.; 14in. thick, 1s. 10d.; up to 35ft. super. and 14in. thick, 4s. 8d. per super. foot; ashlar, 12in. high, 8d.; ditto, cut natural, 9d. per lineal foot; rubble, 1s. 6d.; large ditto, 3s. per ton. Stones ordered under 12in. broad or 6in. thick will be charged as if 12in. and 6in. respectively. Broad stones over 5ft. will be charged as cube stones, the thickness, where under ⅓, being calculated as if ⅓rd the breadth. Rybats, scuntions, founds, jambs, and steps sent out quarry worked at list prices in trucks at the quarry, Dunduff, Dunfermline.
374	CRAIGLEITH ...	Edinb'rgh	Calciferous sandstone. *Lower Carboniferous.*	Fine-grained, close-textured sandstone, little mica; bedding observable.	Dark, brownish-grey.	143 7½	148 2½	3¾	15 7¼	15 1½	Was used extensively in Edinburgh—Courts of Law, Custom House, Royal Exchange; St. Andrew's Church, 1785; St. George's Church, 1812; Town Hall, Leith, 1827; Old University, 1789; Calton Hill Monument, 1823. Analysis:—Silicon oxide, 98·3; calcium carbonate, 1·1; iron and aluminium oxide, 0·6. Craig says (Edinburgh Geological Society, xxxii.):—"The public and private buildings of the New Town, Edinburgh, were almost entirely built with stone from this famous quarry. Gradually the stones quarried in this district have become practically worked out. This quarry has an area of about seven acres, and is about 200ft. deep, and it has been worked since the commencement of the 17th century." In 1823 a stone (a "scuntion"?) was excavated in this quarry 136ft. long by 20ft. broad, and its weight was computed at 1,500 tons. A good weather stone. Crushes with 815 to 900·8 tons (B), 273 to 505 tons (Rt). This quarry produced a "Liver" rock and "Bed" rock. The labour on the stone is great, owing to its hardness.
375	CRAIGHTON ... Phillipstoun.	Linlithgow.	Oil-shale series. Coal measures. *Carboniferous.*	Micaceous, fine-grained sandstone, close texture; rubs smooth; bedding may be traced. "Liver" rock.	Dull purplish-brown.	134 2¾	135 3	¾	16 6¾	16 6¾	Surgeons' Hall, 1890, Edinburgh; Craigcrook Castle, 1891. Similar to Binny stone, No. 357. Cube stone, 20ft., 1s. 4d.; 30ft., 1s. 10d.; 40ft., 2s. 5d.; 50ft., 3s. 3d.; 60ft., 4s. 3d. Broad stones under 6ft., 6in. thick, 8d.; same area up to 14in. thick at 1s. 6d.; 35ft. super, 6in. thick, 2s. 10d.; up to 14in. thick, 4s. 3d. Long stones, 4ft., 12in. by 7in., 3s.; 4ft., 24in. by 11in., 9s. 8d.; up to 12ft., 12in. by 7in., 20s. 9d.; 12ft., 24in. by 11in., 74s. 9d. *each*. Columns, wheeling steps, founds, backs, scuntions, coursers, chimney heads, rybats, jambs, and pavements are supplied at list prices, which are quoted at quarry. Proprietors propose closing this quarry soon.
376	CRAIGNAIR ... Dalbeattie.	Kirkcudbright.	Granite.	Hornblende, biotite, with grey quartz, porphyritic.	Light grey.	165 2¾	165 9¼	⅜	13 6¼	13 6¾	Liverpool and Birkenhead Docks; Branch Bank of England, Liverpool; Thames Embankment at the Temple; Chelsea and St. Thomas's Hospitals. The quarry supplies blocks of all sizes for enginneering and monumental purposes, building rubble and crushed granite for pavements, concrete, gravel, sand, &c.
377	DALREOCH ... Dumbarton.	Dumbarton.	*Lower Carboniferous.*	Fine-grained crystalline sandstone; bedding distinct; does not rub smooth.	Light grey.	138 8½	145 14½	5⅞	16 2	15 4¼	West Bridgend and Knoxland Churches and Schools; memorial halls, several banks—in short, nearly all Dumbarton is built with this stone. Cube stones, under 20ft., 1s. 4d.; 30ft., 1s. 10d.; 40ft., 2s. 5d.; 50ft., 3s. 3d.; 60ft., 4s. 3d. Rubble, 2s. per cart in quarry, 2s. 5d. on trucks. Columns 6ft. long, 15in. by 15in., 18s. 11d. each; same length, 24in. by 24in., 63s. 11d. each; 15ft. long, 15in. by 15in., 109s. 10d. each; 15ft. long, 24in. by 24in., 325s. 10d. each. Wheeling steps, 3ft. 6in. long 13^{6} and 7in. thick, 2s. 11d.; 4ft. long 18^{6} and 7in. thick, 3s. 3d.; 5ft. long, 4s. 3d.; 6ft., 6s. 1d.; 7ft., 8s. 3d. each. Cope, 12in. by 6in., 8½d.; 14in. by 6in. 10d.; 16in. by 6in., 1s. per lineal foot. There are no beds in this quarry; all the work is cut out of the solid.
78	DANCING CAIRNS. Aberdeen (3).	Aberdeen.	Granite.	Quartz orthoclase, oligoclase, and biotite.	Light bluish-grey.	168 11¾	169 1	⅜	13 3½	13 3	Chiefly used for paving setts. Harris says the portico of the Music Hall buildings, and the monolith of the Gordon statue, Aberdeen, are of this rock.
379	DEVON .... Alloa.	Clackmannan.	Coal Measures. *Carboniferous.*	Moderately fine-grained micaceous sandstone. No bedding observable.	Light grey, with pink tinge.	134 1	141 13½	6⅛	16 8½	15 9½	One-half the town of Alloa is built with this stone. Two churches in Crieff. Beds from 2ft. to 2ft. 6in. thick. Worked by the lessee of Arno Quarry, 350. This is a pink stone; the Arno is a white stone. Cube stones, under 5ft. cube and 5ft. long, 1s.; 10ft. cube, 1s. 2d.; 15ft. cube, 1s. 4d.; 20ft. cube, 1s. 6d.; 25ft. cube, 1s. 10d.; 30ft. cube, 2s. 4d. If the stones are 10ft. long, the prices per cubic foot are nearly doubled. Long stones, under 5ft. long and 6in. thick, 8d.; 7in., 8d.; 8in., 9d.; 9in., 10d.; 10in., 1s.; 11in., 1s. 1d. per *superficial* foot. Stones up to 8ft. long, same thickness, are nearly double these prices. Rybats, corners, ashlar, coursers, scuntions, backs, and founds supplied at quarry list prices. All the Scotch quarry owners require notice of deficiency to be made within six days of delivery, or no allowance will be made.
380	DUBTON .... Auldbar.	Forfar ...	Old Red sandstone. *Devonian.*	Fine-grained micaceous bedding sandstone. Mica plats parallel to bedding.	Dark bluish-grey.	152 12½	156 9	3	14 8	14 3½	A pavement quarry, chiefly sized stones, containing not more than 10ft., 2½in. thick, 7d.; 3in., 8d.; 4in., 9d.; 5in., 11d.; 6in., 1s. 1d.; 7in., 1s. 3d.; 8in., 1s. 6d.; 9in., 1s. 9d. Stones can be obtained up to 62ft. super. at the following prices respectively (commencing with 3in.): 2s. 10d., 2s. 11d., 3s. 1d., 3s. 3d., 3s. 5d., 3s. 8d., 3s. 11d. Dressed steps, 4ft. by 6in., 10d.; dressed on tread and sawn on breast, same size, 1s.; dressed on tread and plain breasted, 1s. 2d.; dressed on tread and bottled, 1s. 4d. per super. foot; polishing pavement, ¾d. per foot extra; saw-jointed 2in. or 3in. thick, 1d. ditto; 4in. thick, 1½d. ditto; bottling steps is charged 3d. per foot extra. Prices are for stone free on rail at quarries.

No.	Quarry.	County.	Geological Formation.	Description.	Colour.	Weight of a Cube Foot.		Water Absorbed per Cube Foot.	No. of Cube Feet to 1 ton.		Remarks. Where used, analysis, crushing strain in tons per ft. super., cost per cube foot.
						Dry.	Wet.		Dry.	Wet.	
						lb. oz	lb. oz.	Pints.	ft. in.	ft. in.	
381	Dunbar.........	Haddington.	Lower. *Carboniferous.*	Fine-grained micaceous sandstone. Bedding very distinct.	Purplish red.	139 3	145 10½	5⅜	16 1½	15 5	Block stone not exceeding 5c.ft., 1s. per foot; from 5ft. to 10ft., 1s. 2d. per foot, not more than 6ft. long, and so on.
382	Dunmore ...... Stirling.	Stirling ...	Coal Measures. *Carboniferous.*	Fine-grained crystalline sandstone, with cavities and specks of carbon and ferruginous matter.	Light grey of a cold shade.	141 10¼	147 12½	4⅞	15 9¾	15 1¾	Half of Municipal Buildings, Central Station and Hotel, and Union Bank, Glasgow; St. Mary's Cathedral, Edinburgh. Craig says of this stone (Edinburgh Geological Society, xxxii. Vol. 6): "Coltbridge Hall, Murigfield, 1875; the frieze is wasting below the first cornice. The stones at U.P. Church, Morningside, 1884, are a good deal decayed. At the Pillars in Meadows, 1888, it is weathering badly, especially in the cornices; and at the Stock Exchange, 1889, it is already decaying in many places. In east front it is good, except in one stone." Analysis:—Silica oxide, 91·51; aluminium oxide, ·47; iron oxide, 1·49; calcium carbonate, 3·24; magnesium carbonate, 2·12; combined water, 1·20. Crushes with 289·3 tons (B).
383	Dunrobin...... Brora.	Sutherland.	Great Oolite *Middle Jurassic.*	Fine-grained silicious sandstone; no lime, no oolitic structure visible; bedding not distinct.	Cream.	117 4¾	131 9	11⅞	19 1¼	17 0¼	R.C. Monastery, Fort Augustus, "and the best buildings in the north." This stone is easily worked, looks well, hardens with exposure, and is very durable. Cube stones, blocks under 5ft., 1s.; 10ft., 1s. 2d.; 15ft., 1s. 4d.; 20ft., 1s. 6d. Long stones, 5ft. by 12in. by 8in., 8d. per lineal foot; 6ft., 10d. ditto; 9ft. by 12in. by 10in., 1s. 4d. ditto. Common "rybets," 8d. per rising foot. Inband "rybets," 2ft. long, charged ashlar price. Prices for stones on truck, Brora station.
384	Dyce .... Anguston.	Aberdeen.	Granite. *Granophyre.*	Quartz, orthoclase, and biotite.	Dark grey.	167 3¼	167 9¾	¼	13 4	13 3½	Chiefly a kerb and paving sett quarry. Crushes with 908·4 to 1253·0 tons (B).
385	Eglington ... Skelmorlie.	Ayr.........	Old Red Sandstone *Devonian.*	Fine-grained sandstone; no mica; rubs fairly smooth, bedding may be traced.	Red.	138 0	144 10½	5¼	16 2¾	15 5¾	Cube stones under 15ft., 1s.; 20ft., 1s. 2d.; 25ft., 1s. 4d.; 30ft., 1s. 7d.; 35ft., 1s. 10d.; 40ft., 2s. 1d.; 45ft., 2s. 4d. per cube foot; length not to exceed twice the breath, nor breath twice the thickness. Broad stones under 6ft. super., 6in. thick, 7d.; 8in., 9d.; 9in., 11d. per foot; up to 26ft. super., 6in. 1s. 7d.; 8in., 1s. 9d.; 10in., 2s. per foot. Long stones from 4ft. by 12in. by 7in. at 2s. 7d. each up to 12ft.; 24in. by 11in. at 64s. 9d. each. Stone-cut parapets will be charged 10 per cent. additional. Stones cut in natural beds will be charged 15 per cent. additional. Common "ruble," 1s. 8d. per ton; cut do., 2s. 6d. Backs, scuntions, coursers, chimney heads, "rybets," and common ashlar at quarry list prices. Quotations are for stones in the quarry; if put on rail at Wemyss Station, add 2s. per ton. Accounts from this quarry are rendered every second Friday to be settled on Saturday!
386	Ferry Toll .. Inverkeithing.	Fife.........	Greenstone. Dolerlite.	An aggregate of crystals of plagioclase and augite.	Dark blue grey.	163 15½	165 10¾	1⅝	13 7¼	13 6	This quarry is chiefly worked for paving setts, kerbs, channels, and stone for macadamising. Stone in the rough would cost 1s. per cube foot on rails at Inverkeithing.
387	Giffnock ...... Pollockshaw.	Renfrew.	Coal Measures. *Carboniferous.*	Fine-grained, micaceous sandstone; highly crystalline; rubs smooth.	Whitish grey.	136 3½	142 9½	5⅓	16 5¼	15 8½	St. Paul's Church, Woodside-terrace, and Crescent, Glasgow; university, Enoch station and hotel, Hawkhead Asylum, Glasgow; Custom House Offices, Belfast. Prices same as for Craighton, No. 375. Crushes with 218 to 309 tons (Rt). "Does not weather well in a murky atmosphere" (Craig).
388	Greenhill ... Kilmaurs.	Ayr.........	Coal Measures. *Carboniferous.*	Very fine, close-grained sandstone, no mica; rubs very smooth; bedding distinct.	Greenish grey.	153 2	157 6	3⅜	14 7½	14 2¾	This quarry is worked for pavements, jambs, lintels, and steps. Jambs, dressed on face and breast, 3ft. by 20in. by 5in., 3s. 8d.; 3ft. 6in. by 20in. by 5in., 4s. 6d.; 4ft. 20in. by 6in., 5s. 6d.; 5ft. 24in. by 6in., 11s. 6d. Jamb lintels dressed on face and top 3ft. 10in. by 7in. by 7in., 4s.; 4ft. 6in. by 9in. by 9in., 5s. 10d.; 5ft. by 10in. by 10in.; 7s. 10d. Steps dressed on tread and planed on breast, 4ft. by 7in., 1s. 4d. per foot super.; do., dressed on tread and bottled and fillited, 1s. 5d. Platts, rough, not dressed, under 10ft., 7in. thick, 10d. per super foot; under 30ft., 8in. thick, 2s. 1d. do. at quarry.
389	Hailes .... Slateford.	Edinb'rgh	Coal Measures. *Carboniferous.*	Fine-grained sandstone; fine streaks of carbon parallel to bedding, which is distinct.	Greyish white. Bluish grey. Not much difference in colours in hand specimens.	141 6¼ 138 5¼	146 8½ 144 14½	White. 4⅓ Blue. 4⅝	15 10 16 2¼	15 3¼ 15 5½	St. Mary's Cathedral, Observatory, St. Cuthbert's Parish Church, and extensively in Edinburgh; also in Leith and Portobello. Cube stones not exceeding 5ft., 1s. 2d.; do., 10ft., 1s. 10d.; do., 15ft., 2s. 4d.; do., 20ft., 2s. 10d.; do., 30ft., 3s. 4d. Cowstones not exceeding 15ft. super, 6in. thick, 6d. per foot; do., 30ft., 9d. Briggs and flags 3d. per super foot. White rock ⅓ less than blue. All stones over 4in. and under 6in. thick are charged as 6in.; all stones under 12in. broad are charged as if they were 12in. broad; all stones 10in. and 11in. thick are charged as cube stones; all "confined" pavement ½d. per foot extra. White stone crushes with 621·6 to 682·5 tons; blue with 428·3 to 480·5 tons (B). Used extensively for rubble work. Craig says: "Many buildings of this stone are standing well, but some of the stones are weathering badly on account of the thick clay bands, especially of the blue and grey rock."

THE DECORATION OF LEEDS TOWN HALL.

THE scaffolding is being removed from the interior of the Town Hall at Leeds, which is being decorated in colour under the direction of Mr. J. D. Crace, of Dulwich. The main objects of the decorative scheme, as originally explained to the Town Hall Committee by Mr. Crace, has been to do justice to the features and proportions of the architecture; to use such colouring and contrasts as would to some extent combat the too-frequent gloom of the Leeds atmosphere; and, lastly, to so arrange the colours as to produce an effective result by artificial light as well as by day. The great semicircular vault of the roof is treated, the *Leeds Mercury* explains, with light tones of cream white, broken by mouldings and ornaments in gold and gold colour, and pierced by the square sunk panels or coffers of blue as a background to the large rosettes which occupy them. The vault is divided, in its length, into five bays by broad borders of bronzed laurel-leaf enrichments, confined by wide gilt bands; the division corresponding to the position of the double columns below. These columns are painted in imitation of red marble—a treatment adopted originally by the architect of the building, Mr. Brodrick, when it was first completed. Had there then existed the facilities which now exist for procuring coloured marbles, no doubt Mr. Brodrick would have been glad of the real thing, for it was his expressed intention that they should appear as coloured marble. The red tone of these is the key-note of the decoration. It appears as a ground to the ornament of the frieze, and again in the arched linings of the windows; whilst it also marks out the semicircular ends of the hall as the ground colour of the inscriptions. It does much to cheer and warm the interior, and affords a valuable contrast to the light tones of the roof and the buff panels of the walls. The capitals of the columns are bronzed and richly gilt, and the door dressings, the front of the new gallery, and some other features are similarly treated. The ceiling beneath the gallery, which is in complete shadow, is decorated entirely in soft shades of white. In the vestibule, now in Mr. Crace's hands, the treatment is not unlike that in the hall, but with deeper colouring. Upwards of five hundred poles were employed in the scaffolding, besides boards, ropes, &c. This work has been performed by a local firm—Messrs. Mountain and Son. The wide gilt bands which border the arches, dividing the main roof into bays, are each more than 4in. wide, and their total length is about half a mile. They are gilt solid. There is half a mile of one 3in. moulding surrounding the panels of the roof, whilst the run of painted margins in the roof amounts to a mile and a half. The work is expected to be completed in about a month.

◆

GOEHRING AND ITS USES.

WE have on previous occasions described the many advantages of Goehring in framing and woodwork. A useful little brochure has been published by Messrs. J. M. Bennett and Sons, Timber Merchants, of Ardwick, Manchester, entitled "Goehring: What it is, How to Get it, and Where to Use it," which, in the compass of a few pages, describes the characteristics and many applications of this useful internal decoration. In the domain of ornamental woodwork the introduction of Goehring has enabled the householder and his architect to avail themselves of a species of decoration which very nearly resembles hand carving. Unlike those processes by which wood is embossed or stamped into ornamental forms, it has all the advantages of moulding cut out of the solid timber, with much of the beauty and ornamental effect of carving. Its inventor, Dr. Charles Louis Goehring, has perfected a marvellous system of machinery by which it is produced. The ornament produced is essentially geometrical, and can be applied to all kinds of moulding, spiral turning, matchboarding, panelling, architraves, framing, picture frames, ceiling panels, and other decorative treatments of wood. Thus a Goehring board, every third or fourth board of matchboarding, makes an effective and inexpensive lining. Goehring does not claim to be an imitation of or substitute for carving, and on this ground it has a decided merit over many modern processes. Several excellent examples of its application are given. Thus for ceilings it can be used with admirable effect. Old plaster ceilings need not be removed, but boarded over by Goehring mouldings or panelled. For rooms, the dado and door panels can be framed with it, and picture mouldings of Goehring introduced. Staircases can be lined with it, and rooms, like ladies' boudoirs, libraries, and billiard-rooms, panelled. For office screens and partitions, and a hundred other kinds of woodwork, this invention is applicable. Amongst the other uses to which it appears well adapted are the wooden pipes of organs, which can be brought to the front instead of the metal pipes, dado, picture rails and overmantels. As a casing of a decorative character, the value of Goehring cannot be overrated, and in this capacity we would recommend it for casing iron columns, girders, stair soffits. An example is given of a passenger elevator cased with mouldings and panels, making an inexpensive ornamental interior. We recommend our practical readers to obtain this little handbook, where the advantages of this decorative material are enumerated, and it is of importance to notice that the cost of Goehring is only a trifle above that of ordinary plain timber. The grain of the wood is cut crosswise. The most intricate patterns can be cut, and these have all the sharpness and precision of the best hand work. Raised and sunk patterns are alike produced, and the Goehring machinery is capable of producing spiral, twisted, and square turning.

◆

THEATRES.—XL.

By Ernest A. E. Woodrow, A.R.I.B.A.

There appears to be much more thought displayed for the personal comfort of the playgoers in the planning of Continental theatres, in the way of cloakrooms, than in this country; but, on the other hand, there is often a lack of urinal and w.c. accommodation shown in foreign playhouses.

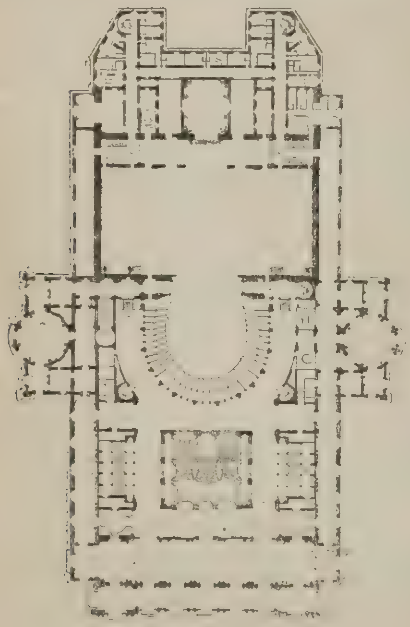


Fig. 1.

Too often we find in England that the cloakroom has been altogether omitted from the plan of the auditorium, and the manager has to have resource to an arrangement which in itself may be looked upon as one of danger to the public. I refer to the placing of hat and cloak-pegs, umbrella stands, and sometimes a counter in the passages and corridors of the theatre. This is dangerous, as it obstructs and impedes the free progress of the outgoing crowd; it is inconvenient and obstructive when the audience leave in the ordinary quiet way after the play; it would be highly dangerous in the event of a rush, as it not only lessens the width of the passage-way, but also creates stumbling-blocks in the path.

The omission of proper cloakrooms may be rightly considered as a lack of provision for public safety, as a manager cannot work his theatre without them, and if the architect omits them, he is forced to resort to some makeshift.

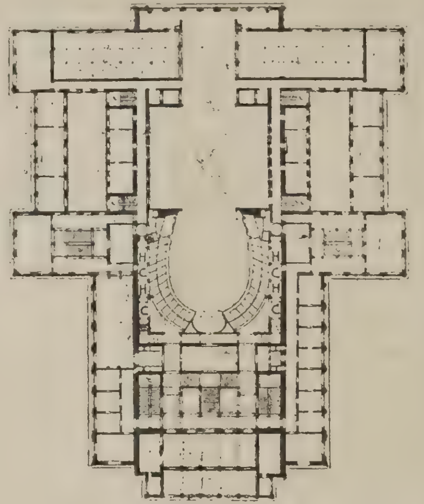

Fig. 2.

The planning of cloakrooms may, therefore, be looked upon as an essential provision for public safety as well as public comfort. Speaking on this particular point, Mr. Buckle writes: "Many representative theatres are sadly deficient in retiring-room accommodation. When planning these rooms due regard for the natural modesty of English ladies, and approaches arranged with some degree of privacy, so as not to render progress to and from glaringly observable, is advisable. . . . Each room should be fitted with a counter, having shelves below, and a sufficient number of cloak-pegs." "Gentlemen's cloakrooms," continues the same writer, "should be arranged near the entrance vestibule, but removed from the direct line of exit. Cloakrooms are most desirably situated when approached by passages leading off the main corridors. These passages may with advantage be divided longitudinally, the people passing up one side to the cloakroom and returning down the other. By this means struggling and confusion are avoided, and those congregating at the cloakrooms do not impede the egress of the audience."

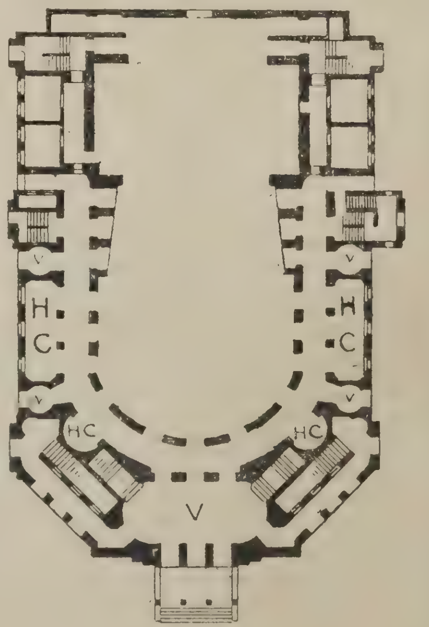

Fig. 3.

The English public have a dislike to part with any of their property in places of entertainment, due partly to the difficulty of obtaining their hats, &c., through the crowding in the cloakrooms after the performance is over, and partly to the tendency of preferring to keep possession of their own hat and coat. To meet this objection we have seen how some managers provide room under the seats for hats and coats. I have heard of a case where a man safely escaped from a theatre in flames, but returned to fetch his hat and was burned to death. I cannot at the moment remember where the fire occurred, but I received this information on good authority.

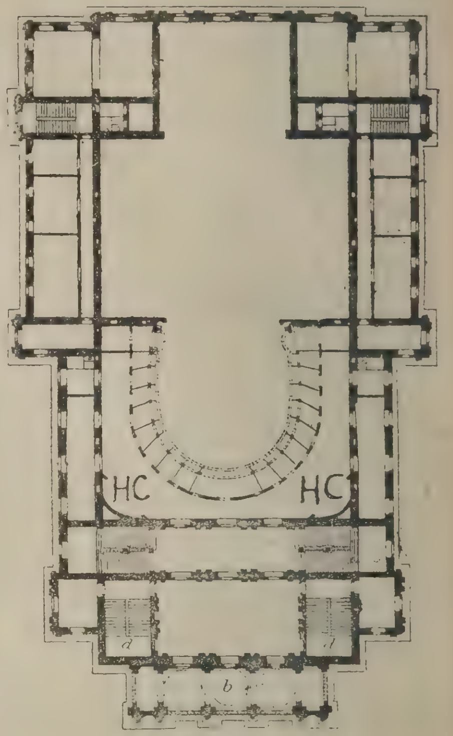

Fig. 4.

I illustrate a few plans showing the position of the retiring-rooms in different theatres:—

In Fig. 1, of the Paris Opera House, the cloakrooms H C may appear small; but there the demand is limited, as the private boxes are of such dimensions as to afford conveniences for the putting away and hanging up of wraps, &c.

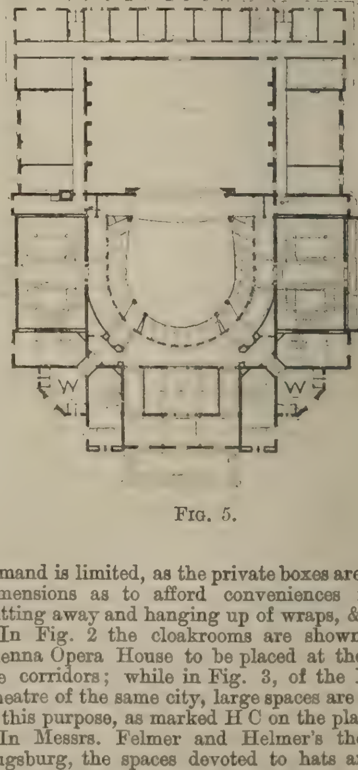

Fig. 5.

In Fig. 2 the cloakrooms are shown in the Vienna Opera House to be placed at the side of the corridors; while in Fig. 3, of the People's Theatre of the same city, large spaces are allotted to this purpose, as marked H C on the plan.

In Messrs. Felmer and Helmer's theatre at Augsburg, the spaces devoted to hats and coats are in the spare corners of the corridors formed by the square walls of the auditorium, and the circular line of the boxes, as shown in Fig. 4. The position of the "ladies'" and "gentlemen's" rooms (W W) in Mr. Jan Springer's Amsterdam theatre, Fig. 5, are very cleverly placed. The rooms are approached through lobbies from the corridors of each tier. They are not, therefore, obtrusive in asserting their existence; at the same time, they can be easily found. These rooms, perhaps, take more the place of lavatories than cloakrooms, as illustrated in Fig. 3.

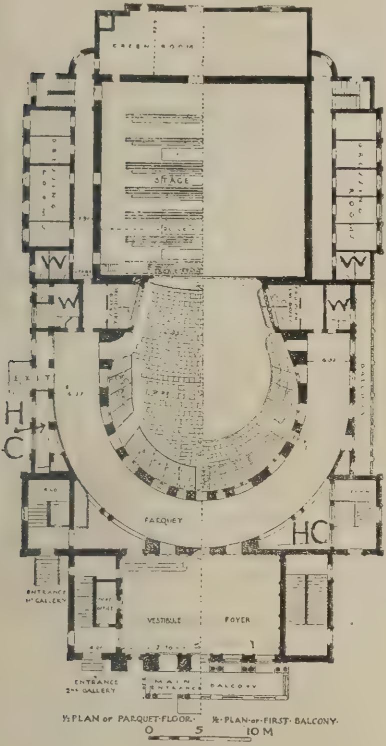

FIG. 6.

Fig. 6, of the Lessing Theatre, I extract from my series of articles now appearing in the *American Architect*. The plan shows two levels with the cloakrooms on each. I also would draw attention to the convenient arrangement of the lavatories and w.c.'s (W W) both for the public and the performers, they being arranged close together, the continuation of the proscenium wall dividing the actor's lavatories from those of the audience.

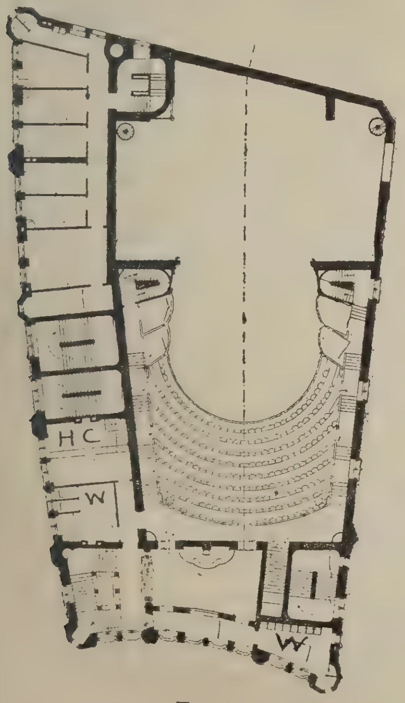

FIG. 8.

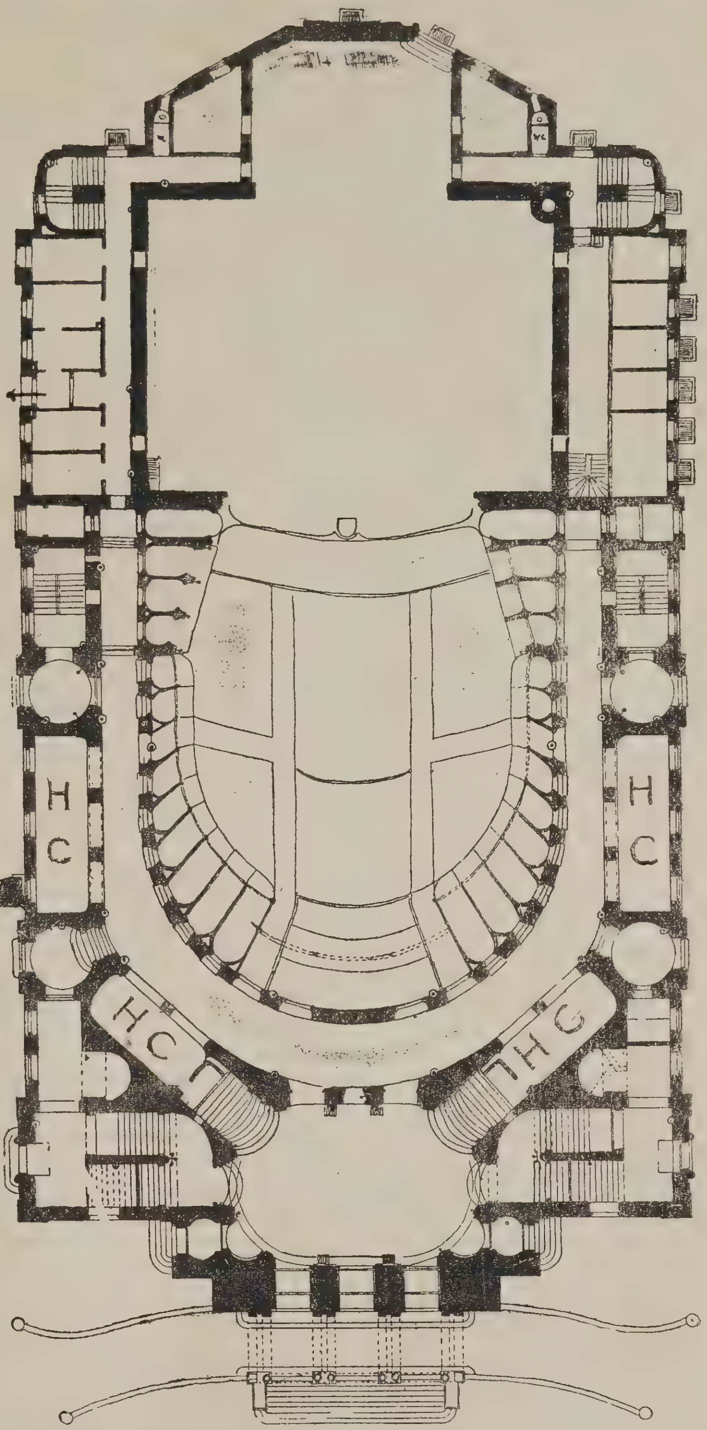

FIG. 7.

In the Prague Theatre (Fig. 7) the arrangement is somewhat similar to that in the Vienna People's Playhouse.

My last illustration, Fig. 8, is of the Royal English Opera House, the plans of which Mr. D'Oyly Carte has kindly permitted me to copy for reproduction in the *American Architect*, and one level of which I have taken the liberty of reproducing here, as one of the latest English theatres of note. The cloakrooms herein shown partake also of the character of lavatories.

It will be seen from these illustrations that abroad special spaces near the corridors are set aside for the reception of hats and coats. This space is, as a rule, large, while the w.c. and urinal accommodation, as I have pointed out, is small. In England, architects usually combine the two in one room. I have already dwelt somewhat upon the necessary arrangements for the provision of w.c.'s, and need only mention here the importance, especially in theatres of variety, of making such provision ample. The rule to be observed in respect to this matter is, at least, one ladies' room and one gentlemen's retiring-room for each division of the audience, and at least one w.c. and one urinal on each floor of the dressing-rooms in small theatres, more accommodation being, of course, required in accordance with the size of the theatre and the number employed therein.

In the accompanying plans the cloakrooms are marked H C, the lavatories W.

No further description need be given as to the internal fittings required in the cloakrooms of theatres. As long as there are plenty of numbered pegs and shelves, all requirements will be met.

NOTES FROM PARIS.

THE Committee of Theatres, presided over by M. Laurent, secretary to the Prefecture of Police, held an important meeting a few days ago, in order to examine the definite plans for the reconstruction of the Opéra Comique. Several important modifications were made to the plans of M. Bernier regarding the arrangements for heating the public portion of the theatre. The opinion of the Committee was that the boilers for heating purposes should not be placed in the cellars below the portion of the theatre devoted to the public, but in another portion of the theatre under the artists' rooms. Fireplaces in the dressing rooms will not be allowed; these rooms will be lighted solely by electricity. The gallery surrounding the pit and dress-circles shall not have a less width than 4ft. 6in.; the number of seats indicated in the present plans will be greatly diminished. The theatre will be constructed in every portion of incombustible materials, the lighting will be exclusively by electricity, the heating will be by steam at low pressure, and the ventilation by means of ventilators worked by electricity; above the stage will be a rolling ventilating trap. The question of the prevention of fire and easy means of exit was closely gone into. The Parliament has just annulled the vote of last year for £20,000, and has opened a new credit for this year for £40,000 for the continuation of the construction of the new theatre.

Decorative art has just lost a master in the person of Joseph Cheret, called the modern Clodion, and brother of the celebrated painter of advertisements, whose artistic posters so enliven the hoardings of Paris. Joseph Cheret, whose beautiful work always obtained the greatest success at the Salons and exhibitions, was a type of the old-fashioned artisan. Having no resources of his own, he was forced at the age of twelve to earn his living at the workshop of a decorator, and by dint of hard work, a real genius, and not trammelled by the classic tradition of the schools, giving his imagination full flight, he at length arrived to be one of the most characteristic decorators of his day; a few weeks only before his death he was decorated with the Legion of Honour. Amongst decorative artists he was one of the few who seemed to understand that architecture is the basis of decoration, and that the latter cannot exist without the former. He was a great admirer of architecture, and had studied its forms and principles to the depth.

The inauguration of the monument to the late celebrated sculptor of animals, Barye, took place a few days ago. This monument, erected on the Isle St. Louis, differs much from the ordinary style of memorial monuments. In memory of the artist, reproductions of the best of his works cover the monument, which contains a simple bronze bas-relief medallion of the sculptor. On the top of the lofty pedestal is placed the well-known group of Theseus fighting the Centaur; on either side of the pedestal are the groups of Order punishing Perversity, and Strength defending Work, two allegorical works of which the originals crown one of the pediments of the Louvre. In front is the celebrated bronze, a lion crushing a serpent.

Painters and sculptors are already feverishly anxious regarding the question of the exhibition of their works before and during the proposed Exposition of 1900. According to the present plans, the Palaces of Industry, of Fine Arts, and Liberal Arts will be included in the Exposition, and as these are the buildings in which the annual Salons take place, the anxiety of the artists may be well understood. The Society of Artists has the intention of asking permission to hold its own Salon at the Louvre; the National Society of Fine Arts, however, is greatly embarrassed in finding a suitable hall for exhibition.

M. Gavault, commissioned by the Minister of Public Instruction for archæological studies in Algeria, has just discovered a large basilic nearly 140ft. long. This monument dates from the 5th or 6th century, and is covered with sculptured ornaments, of which a number are purely ornamental, whilst others represent symbolical animals, fishes, lions, eagles, and bulls, one group representing Daniel in the Lions' Den. Most of the decoration presents a striking analogy with the decoration of the Syrian churches, and also with the designs with which the Kabyles now ornament their jewels.

At a meeting held by the committee of the Exposition of 1900, the discussion turned upon the question of prizes to architects and engineers competing for the general designs for the buildings, and arrangements of position of these buildings and attractions. The opinion was that the prizes of £2,000 for the best ideas were not sufficient, and that these sums should be increased to £4,000. The competition programme will very shortly be decided; a period of four months will be allowed for the preparation of the ideas and designs. The competitors may compose their ideas under the supposition that the whole of the ground devoted to the exhibition is available, and the existing buildings, which may possibly be pulled down, assumed as non-existing, unless the competitor should find these existing buildings useful in the composition of his ideas. The Eiffel Tower is supposed to be left standing. It appears, however, that since this decision the question of demolishing the tower has been discussed. It is, therefore, probable that competitors will be allowed to suppose the position of the tower as unoccupied, and an opportunity given for the imagination of a new attraction. The tower has been and is a financial success, and although our friends on this side declare the exhibition to be rather a means of public teaching than, as they say, "a money-making business," it is probable that, until some other attraction equally successful is imagined, the tower will remain. The competition will be open to all, professional men or amateurs. This being the case the administration will consider the designs to which prizes have been awarded as its own property, with liberty to intrust the execution of the ideas to others than the authors. This is well understood, for it is quite possible that the author of a good idea, and an interesting one, may be perfectly incapable of carrying out his idea in practice. The various sections of the Exposition will be divided into 17 groups, comprising 114 classes:—Education and teaching, six classes; works of art, four classes; instruments and processes of letters, science and arts, eight classes; mechanics, four classes; electricity, five classes; engineering and means of transport, seven classes; agriculture, eight classes; horticulture and arboriculture, seven classes; forests, hunting, and fishing, &c., six classes; food, seven classes; mines, metallurgy, three classes; decoration and furniture, ten classes; weaving, cloths and clothing, ten classes; chemistry, five classes, various industries, eight classes; social economy, eleven classes; armies on land and sea, five classes. The groups of social economy and armies are new. A portion of the latter is destined to colonisation.

The Paris Town Council invests each year a certain amount of money for the purchase of works of art exhibited at the two Salons. This year the total of purchases made from amongst the works at the Champs Elysées and the Champ de Mars amounts to over £3,000, nearly equally divided for works of painting and sculpture.

It is a serious question, and one now before Parliament, that of creating a museum fund to be entirely devoted to the maintenance of the various public museums and the purchasing of works of art. It is put forward that France is nearly the only country in which no charge whatever is made to the public for admission to the museums of science and art. The funds allowed by the State are not sufficient to properly keep up the museums or allow the purchase of valuable works of art, which are bought up by other countries richer in the necessary funds. At South Kensington and at the British Museum, it is remarked, there are three paying days a week; in Germany and Austria there are also free days and paying days; whilst in Italy the admission to all museums and monuments is taxed. It is therefore proposed that Paris should follow, and also institute several paying days per week, in order to form sufficient money for competition with other countries in the purchase of interesting works. These funds may also be increased by means of subscriptions, donations, and legacies.

The winners of the Prix de Rome in the section of Painting have just been announced. These are M. Jules Leroux, pupil of M. Bonnat, and M. Adolphe Dechenaud, pupil of Benj. Constant, winners of the Grand Prix; MM. William Laparra, pupil of M. Bougeureau, and Emmanuel Benner, pupil of M. Henner, winners of the first second and second second Grand Prix respectively.

Parliament, at a sitting of the 10th of July, opened a credit of £5,000 for the continuation of the archæological searches at Delphos.

A statue to the memory of the celebrated Condorcet was inaugurated a few days ago, on the Quai Conti, in front of the Institute. The statue is the work of the sculptor Perrin, and presents the celebrated philosopher standing, a book under his left arm, the right arm placed on the breast "à la Bonaparte." The statue is of bronze, and the pedestal bears the inscription, "Condorcet, 1743—1794." Arthur Vye Parminter.

◆

PUBLIC HEALTH CONGRESS IN LONDON.

The Congress of the British Institute of Public Health was inaugurated on Wednesday evening by a conversazione given at King's College, London. The meetings are being held in five sections:—A, Preventive Medicine; B, Chemistry and Climatology; C, Municipal and Parliamentary; D, Engineering and Building Construction; and, E, Naval and Military Hygiene. Section D was opened by a meeting at King's College yesterday (Thursday), at which the chair was taken by the President of the Section, Professor Banister Fletcher, F.R.I.B.A. In his inaugural address, the President summarised the advancements in construction and hygiene that have recently taken place, and then proceeded to indicate the improvements still desired. He summarised the provisions of the Public Health, London, 1891, which has done for the Metropolis what the Public Health Act of 1875 accomplished for the rest of the country, and the London County Council General Powers Act of 1890. The London Streets and Buildings Bill, which had, he remarked, every likelihood of becoming law, was a Bill to consolidate and amend the enactments relating to streets and buildings in London. The idea was to repeal the thirteen Acts under which at present all buildings were regulated in London, and to form a new Act which would embrace the regulations in these Acts and embody other regulations of great importance. This Act was one that was much required, though the President could not agree with some of its proposed regulations. He urged the paramount importance of intelligent energy in carrying out the law, remarking that it was self-evident that one might make the most perfect rules and by-laws and yet not have good buildings, unless those appointed to supervise, themselves understood how the work should be done. The principal, or, at least, the most important, duties for a sanitary inspector were those of seeing that buildings were properly built, and the drainage work properly executed with proper materials; and clearly the best man for such work was one who had been practically brought up in the building trades. Having referred in detail to the construction, drainage, plumbing, and water supply of dwellings, the President passed on to consider the lighting, and observed that, from a sanitary point of view, the electric light had no competitor. Gas seemed to have a future for cooking and heating, but for illuminating powers they hoped for its speedy extinction. In conclusion, Professor Fletcher alluded to the fact that no public baths or washhouses had been provided in the City, and having touched on the sanitary condition of London streets, he urged the importance of sanitary education to the architect and engineer.

During the afternoon papers were read in this section by Mr. W. H. Preece, C.B., F.R.S., on "Electric Lighting as a Health Agent"; by Mr. James Thomson, C.E., on "The Sanitation of Flats"; and by Mr. Walter G. Atkins, on "The Softening of Public Water Supplies."

This (Friday) afternoon the Section D will again meet at King's College, from 2 till 5 p.m., when the following papers will be read and discussed: "The Destruction of Town Refuse," by Mr. Charles Jones, of Ealing; "Sewage Effluents," by Mr. W. Kaye Parry, C.E., of Dublin; and "A London Architect's Troubles with the Local Sanitary Authorities," by Mr. Lewis Solomon, F.R.I.B.A.

The papers to be read and discussed on Monday afternoon at the same place include: "The Architectural Features of Elementary Schools from a Public Health Point of View," by Mr. T. J. Bailey, F.R.I.B.A, architect to the London School Board; "Electric Lighting, Power, and Heating," by G. Binswanger; "Eastwood and Grensley Drainage Works," by Mr. J. G. Browning, resident engineer; and "The Planning of Fever Hospitals," by Mr. Campbell Douglas, F.R.I.B.A., of Glasgow.

◆

It has been decided to light the magnificent church of St. Mary de Redcliffe, Bristol, with electricity, and Mr. W. H. Massey, of Twyford, consulting electrical engineer to the Cardiff corporation, has been instructed by the vestry to draw up, in conjunction with Sir Arthur Blomfield, A.R.A., a special report and scheme.

The Pengelly Memorial Fund amounts to £1,358, and the local committee at Torquay have commissioned Mr. E. P. Bovey to proceed with the erection of a portion of the additions to the Torquay Natural History Museum, from the designs of Mr. W. Harvey, of London. The amount already subscribed is only sufficient to cover the cost of the lecture theatre, but other buildings are contemplated as a complete memorial to the founder of the museum.

OLD MASTERS ON THE CONTINENT.—VII.

WE publish this week, as the seventh of our series of reproductions of paintings in Continental galleries, Benozzo Gozzoli's spirited version of "The Journey of the Magi" from the East towards Jerusalem (Matt. ii. 1). It is one of this artist's frescoes, illustrating the history of the Wise Men, extending over three walls of the private chapel on the first floor of the Palazzo Riccardi, Florence, the ancient palace of the Medici. This building was erected in 1434 under Cosmo, the Father of his Country, from a design by Michelozzi, and since 1814 has been a public building. A biography of Gozzoli and a description of the fresco are given in Mr. C. L. Eastlake's article on p. 98 *ante*.

THE TOWER BRIDGE.

ON June 29, the day before that on which the Tower Bridge was opened, we published a general drawing of the entire structure, with plans of the various parts, besides a double-page detail of the great towers' upper stages. On July 13th a detail drawing was printed, illustrating these buildings as a whole. To-day another double-page plate, also drawn by Mr. G. D. Stevenson, A.R.I.B.A., the architect who is responsible for the designs of these details, appears among our lithographs in delineation of the north and south façades of the main towers, with sectional plans through the balconies and windows.

GOATHLAND CHURCH.

THIS church is being built amidst fine moorland scenery between Pickering and Whitby, and is to take the place of a barn-like building erected in 1812. It comprises: nave, 52ft. by 22ft.; chancel, 32ft. by 19ft.; vestries, 22ft. 6in. by 10ft. 6in., and S. porch, ringing belfry, and heating-chambers, and will altogether accommodate 180 people. The materials are local stone, pitch-pine roofs covered with red tiles, and sanded quarry glazing. A low, sturdy character of design was thought most suitable for such a wild locality. Mr. Barnes, of Malton, is the contractor; and Messrs. Demaine and Brierley, of York, are the architects.

RUFFORTH CHURCH, NEAR YORK.

THIS church is being erected to the memory of the late Mr. Middlewood, of Rufforth Hall, at the sole cost of his widow and daughters, and is to replace a dilapidated building chiefly of the last century, but in which one or two earlier features were found, which have been carefully incorporated in the new work. The church will comprise nave, 41ft. 6in. by 18ft. 2in.; S. aisle, 30ft. by 9ft.; chancel, 28ft. 6in. by 18ft. 2in.; vestries, heating-chamber, ringing and clock floors, &c., and will accommodate about 170 people. The materials are local grit stone for the walling, with Whitby stone for the dressings, tracery, &c. The inside is faced with coursed Tadcaster stone, finished with a dragged face. The whole of the roofs and joinery are of oak, and the latter includes a richly-carved chancel-screen and organ-case. Mr. Gould, of Leeds, is the builder, and Messrs. Demaine and Brierley, of York, are the architects.

SCULPTURE AT THE ROYAL ACADEMY.

WE have already given three plates illustrating selected works of sculpture from the present exhibition of the Royal Academy, and to-day we give another sheet of representative examples. Mr. F. W. Pomeroy's water-nymph "Undine," with fish disporting in the encircling waves round the base of the statuette, is an extremely graceful and well-modelled figure with uplifted arms and long flowing tresses of hair behind. The two knockers at once contrast with each other, and in detail they are essentially different, though as seen on the plate the two make a very good pair. Mr. Chas. J. Allen's knocker represents "Fortuna," and Mr. Alfred F. Lewis has chosen "Mermaids," with weeping Love seated in a shell between the sirens. Below is a fish completing the composition. Both designs are admirably suggestive.

DESIGN FOR A HOUSE.

THIS house was designed on a sketch plan provided by the building owner. The illustration shows the ground-floor walls to be faced with red bricks, those to the first floor being covered with half-timber work. The roofs are to be tiled, and the wood framings stained dark brown and oiled. The quoins are of stone. The illustration is from a drawing, now on view at the Royal Academy, by the architect, Mr. R. A. Briggs, F.R.I.B.A., of 2, Devonshire-square, E.C.

THE "GRANVILLE" HOTEL, BOURNEMOUTH.

THIS building has been recently erected on a corner site at the junction of Richmond Hill with Yelverton-road, Bournemouth. Up to the present time, probably no serious attempt has been made towards the application of terracotta for building purposes in the neighbourhood, and this may be instructive when it is remembered that one of the largest manufactories of this material is situated within about two or three miles of the spot, which is in the centre of one of the largest and most modern of our seaside towns, and where it would be naturally expected a large demand would exist were it not for the little difficulties and delays that its adoption often entails. Few architects, however, would perhaps question that these are trifling compared to the many advantages it possesses, and that if greater facilities were offered in its manufacture, that the popular prejudices would be in a much better way of being overcome. The general face is composed of Bridgewater red bricks, they being the best that are easily procurable in the locality. The heating is by ordinary fireplaces and hot-water coils, and the lighting by electricity throughout. The entire works have been carried out by Mr. T. H. Kingerlee, of Oxford, under the superintendence of the architects, Messrs. Lawson and Donkin, Bournemouth.

"LYNDHURST," WESTON-SUPER-MARE.

THIS house is to be built of brick; the lower portion to be faced with dark red face-bricks, the upper portion to be cemented. The roof is to be tiled with Broseley tiles; all external woodwork to be painted a dark brown. On the ground-floor there are three reception-rooms, a studio with a north light, and a large hall fitted as a billiard-room. There are nine bedrooms, dressing-room, bath-room, &c., on the first floor. Mr. J. Ramsay Cox, of Weston-super-Mare, is the architect.

◆

The work in connection with the erection of the new church at Gretna, near Carlisle, was commenced last week. The building occupies an open elevated site at the corner of four roads between Gretna Green and Springfield, and will accommodate over 200 persons. It is being erected from designs prepared by Mr. T. Taylor Scott, architect, of Carlisle. The contractors selected for the various trades are:—Mr. James Rae, builder, Ecclefechan; Mr. A. Tweedie, joiner, Annan; Messrs. Millar and Son, plumbers, Annan; Mr. McCulloch, painter, glazier, and decorator, Annan; Mr. C. J. Nanson, slater, Carlisle; and Mr. W. Norman, plasterer, Carlisle.

WORKMEN'S CLUB UNION CONVALESCENT HOME, PEGWELL BAY, ISLE OF THANET.

BANK HOLIDAY in August this year will mark a memorable occasion for Pegwell Bay, near Ramsgate, when this institution, which Mr. J. Passmore Edwards has given to the Working Men's Club and Institute Union, will be opened, equipped and ready for use with accommodation for about 35 beds. In connection with the Club Union, whose offices adjoin the Holborn Town Hall in the Clerkenwell-road, there are 150 clubs in London with 35,000 members, and in the Provinces there are 300 clubs associated in the same way and giving 45,000 more members. The Pegwell Bay Convalescent Home thus about to be opened will be used mainly by members introduced by the London clubs. Three weeks of residence is the usual time contemplated for each patient, who will contribute five shillings per week towards his board, the club by whom he is nominated paying 21s. for his term. Should the honorary physician, Dr. Channing Pearce, of Ramsgate, certify that an extension of the patient's stay is desirable, he may for an additional five shillings remain for another week. The patients to be received will be mostly artisans. For months past the work of converting the mansion formerly known as the Clifton Hotel, with its annex buildings on the other side of the Ramsgate-road, into a convalescent home has been in progress. Originally over £20,000 was expended by the company by whom these buildings were erected, and besides, a sea-wall, inclosing the skating rink or tennis courts, was built, forming in its entirety a promenade about 550ft. in length. The two main buildings, now transformed for the purposes of the home given by Mr. Passmore Edwards, are connected by a tunnelled corridor under the public roadway, and by this means a direct and private communication is obtained for the inmates with the rink overlooking the shore, and where there are terraced walks and summer-houses commanding a sea view beyond Ramsgate Foreland and Harbour to the north, and southwards to Deal and Walmer. The whole of the ground floor of the principal part of the institution will be used as offices and reception rooms. The superintendent's office commands all departments and all entrances, as well as both staircases, thus insuring a ready supervision. All the upper stories of both buildings will be used as dormitories, and bath-rooms are provided with w.c.'s to each floor. The kitchen department is in the basement, and has new ranges and coppers, sinks, &c. Beyond the tunnelled passage way leading from the principal wing to the lower half of the establishment, is an alcove surrounded by wall-benches, from whence in a sunny and well-screened corner a fine view of the bay is obtained. The refectory, or dining-hall, is on this level, with direct service from the kitchen, and below a day-room for reading and games, &c., is situated at the same level as the tennis-courts and terraces which extend to the sea-wall on the shore. All the rooms are rendered cheerful and pretty with artistically patterned papers, the colours of the painted work being in harmony with them. The passages, staircases, corridors, and offices above the dado levels are finished in flatted colour of a pink terra-cotta shade, the joiner's fittings being in reds. All the old sanitary arrangements have been removed, and new drains, lavatories, and closets on the most practical principles have been employed. The buildings have been almost entirely re-roofed. Teale's grates have also been introduced. The contractors were Messrs. Jarman and Sons, of Ramsgate, and the architect supervising the work was Mr. Maurice B. Adams, F.R.I.B.A. Part of the improvement thus carried out by Mr. Passmore Edwards is due to his gift of a portion of the frontage of his property adjoining the Convalescent Home, whereby the public roadway has been materially widened just where it was most dangerous and restricted, at the foot of the hill near the angle of the buildings. The Mayor of Ramsgate was appointed to apply to Mr. Edwards, on behalf of the Corporation, who were anxious to secure so manifest a public improvement, to which Mr. Edwards at once consented.

◆

Major-General H. D. Crozier, R.E., Local Government Board Inspector, held an inquiry at Exmouth on Thursday in last week, the local board having applied to borrow £1,500 for laying out public walks and pleasure grounds. Considerable opposition was raised to the proposal.

WAYSIDE NOTES.

Among the various picnics and congresses which will presently beguile the leisure of the wearied world of art and science, the Congress on Internal Navigation, which commenced its deliberations on Monday at the Hague, seems likely to be of some interest to civil engineers. One of the subjects which has received prominent attention was the question of the construction of navigable canals, and the means of preventing them from being frozen up. The British Association will meet at Oxford soon. Some of the papers are on subjects of much interest as well as of practical value. Among them will be Professor Bayley Balfour's paper on "Forestry," a subject which is being forced on the attention of landowners from various quarters and with various baits. Germany, they are told, for example, finds great pecuniary profit in its timber trade. The temptation to plant would be irresistible if we could only tell the many-acred squire who cannot let his farms that the trees, like the gourd of Scripture, would grow up in a single night. But the cultivation of timber demands the years of Methuselah and the patience of Job combined.

One more of the literary landmarks of London is about to vanish before the march of enterprise. The old home of Dickens in his early years is about to disappear, that the new wing of an insurance office may be erected on the site. It is Wood's Hotel, in Furnival's Inn, two of the rooms of which, just over the entrance, Dickens occupied when he was a Gallery reporter on the *Morning Chronicle*. One of these was his bedroom, and the other his sitting-room. He occupied these rooms for six months. Then he migrated to other rooms in the Inn unconnected with the hotel, and after a short sojourn in them he removed again to others close by in the same Inn, which formed his home for several years from 1835. This last house cost him £50 a year for rent, and its long identification with the great novelist when he was shooting into fame has led the Society of Arts to affix to it one of the tablets which it is putting on many of the historic houses of London. If any reader, curious in such matters, should ever visit the spot, he will find the house and the tablet at No. 15, where, doubtless, that rising young architect, John Westlock, had his diggings after his emancipation from his pupilage with Pecksniff.

The Exhibition Commissioners of 1851 have been summoned to meet to-day at Marlborough House, under the presidency of the Prince of Wales, when it may be expected that important questions connected with the disposal of land at South Kensington will be under consideration. The piece of ground adjoining the science collections, purchased by the Government from the Commissioners three years ago, is still awaiting occupation, no decision as to its final appropriation having as yet apparently been arrived at. I wonder what little job is in contemplation to-day? Is the Imperial Institute to be yet a little while longer bolstered up at the expense of the public, who are practically shut out from it, except at times and seasons convenient to the management? Some of these days we shall have the "true history of a surplus," from some one who knows the story of the balance left from the Exhibition of 1851, and a nice record it will be!

I see some of the medical papers have recently been excusing the demerits of wood pavement. My opinion as to its utter unsuitability for large towns remains the same. I see only last week Mr. Burmester submitted a report from the City Streets Committee on the question of repaving Upper Thames-street, and recommending that one portion of the said thoroughfare—viz., from London Bridge to Queen-street, should be paved by way of trial with Australian wood at an estimated cost of about £2,600, and that the question of repaving the remainder of the thoroughfare should be adjourned to try the effect of the experiment. Mr. Gordon moved as an amendment that the thoroughfare in question should be paved with asphalte at an estimated cost of £2,400. Mr. Gordon said that wood was objectionable at that point, in consequence of its absorbent nature. Mr. Wallace having seconded the amendment, and concurred with the remarks made by the mover, the medical officer was called upon to give his opinion on the relative merits of wood and asphalte paving. Dr. Sedgwick Saunders said that, after 21 years' experience in the matter, he was still of the opinion that the only clean and useful pavement for the City streets, having regard to sanitation alone, was asphalte pavement. Wood, in his opinion, was about the worst pavement ever invented. As far as Thames-street was concerned, he had often reported on its condition, and he repeated that the only way to improve the sanitary condition of the street was to lay down a hard and jointless pavement. After discussion, Mr. Gordon's amendment was put to the meeting and carried, and very wisely. Dr. Sedgwick Saunders's opinion is warranted by experience and common-sense.

Despite a great deal of what may be said from the architect's point of view respecting the New Tower Bridge, we have to bear in mind the engineering conditions of a structure to fulfil the requirements. Two very opposite materials had to be combined. It is easy to find fault with the architectural design and details of the bridge—indeed, there is some truth in what Mr. Marsland says about them; but the question is whether the architect would, with so many moving parts to consider, have given us anything more satisfactory as a whole. I took another opportunity of looking at the structure last week, and my impression was generally favourable. The towers and approaches are massive and well designed, though I do not like the way the angle-octagon turrets spring out of the circular corners. The long-pointed corbellings are certainly out of character, and the windows on the narrow sides of the towers look small, cramped, and over-elaborated. Mr. Marsland complains of the suspension chains, and suggests lattice girders to carry the side spans. I think he is wrong here, as the outline of the bridge would in that case have been less graceful. There would have been nothing to give support to the upper part of the towers, and the space between the tower and the approach would have formed a large gap which is now filled up by the chains and their suspending rods.

Lattice girders would have required a proportionate depth over the 270ft. spans, and have left little headway. Rigid forms harmonise better with towers of large size and proportion, and in this respect I agree with Mr. Marsland's strictures that girders would have given a more substantial appearance to the structure, but the engineering requirements made it necessary to have lighter side spans. Chains were thus an indispensable means of giving the necessary strength, and the mode of treating them was one of the difficulties that had to be overcome. It was a crux for both engineer and architect. I do not admire the attachment to the towers, the chain at the junctions tapering to points; but, after all, it is the right form for a chain, for the idea of rigidity at the attachment would be mechanically and æsthetically wrong.

Personally, I should have preferred to see the windows of the towers less ornate and more elongated in shape, so as to give a verticality to the lines of the tower—lancet-formed openings between piers of masonry. I think a sense of greater rigidity would thus have been given to the towers—æsthetically, of course—which would have taken away the present solid-masonry look of the towers, which, as everybody knows, only clothe the steel structures within. From the high-art view of the matter, the Tower Bridge must be pronounced a sham, as no real art can tolerate a casing. At the same time I prefer the towers as they are to huge skeletons of iron or steel, which might have been prodigiously ugly.

"Through the occurrence of unforeseen difficulties" the project of a competition of plans for the Cathedral of Westminster has been abandoned. The Cardinal Archbishop has, therefore, after consulting his advisers and experts in the profession, confided the task of preparing designs for the cathedral to Mr. Bentley. There can be no doubt of the result, architecturally, from the hand of that architect, and all will hope that the work of his life may secure the best fruits of his genius. The scheme provides for a cathedral in plan and arrangement similar in many respects to the old basilica of St. Peter's at Rome, as originally built by the Emperor Constantine, and a Benedictine Monastery; also a palace for the Cardinal Archbishop and a hall capable of holding 2,000 people.

No wonder work is slack for architects and builders in London when the municipal authorities shirk their duty in the way of providing necessary buildings. Sir John Hutton, in his annual address to the London County Council on Tuesday, pleaded strongly for the erection of the new Municipal Hall that is so badly wanted for London. Year by year the London County Council has to waste the ratepayers' money on additional rent for more office accommodation. Twelve separate houses have had to be taken since 1889—or one about every six months. If any other public body thus frittered away its resources on mere temporary accommodation, it would soon be called to account. It is high time that a great municipal hall was built, architecturally worthy of the Capital, which in this respect is put to shame by almost every fifth-rate borough in the Kingdom.

Similarly, "Diggleism" on the London School Board is responsible for the stoppage of the erection of the much-needed new board schools. One well-known senior inspector of schools declares that "the supply of school accommodation is as yet incomplete, and neglect of education has resulted from the deficiency." Another says: "My colleagues are agreed that there is unnecessary delay in recognising the need of building, in getting out plans, and lastly, in completing the buildings. Thousands of children all over London are at present denied admission because there is no room for them." And yet the board, for mere electioneering purposes, neglects to build new schools, and when it does set about the work, is dilatory and cheeseparing to a degree of meanness that is disgusting. Architects and builders who are voters for the London School Board will do well to read "The Case against Diggleism," just published by the Progressive School Board Election Council, and to be had for a shilling of Messrs. Alexander and Shepheard, 21, Furnival-street, E.C. They will find abundant confirmation therein of what I allege, and will, I hope, help to turn out the present reactionary majority when November comes.

CHIPS.

The tower of the ancient church at Stainton, Yorkshire, has been restored, and was reopened by the Bishop of Beverley on Tuesday week.

The bronze statue of Condorcet, by M. Jacques Perrin, exhibited at the Salon of 1892, has been set up on the Quai Conti, Paris, as a pendant to the statue of Voltaire. M. Aubé's statue of F. Boucher, the well-known painter, has been erected in the Jardin des Tuileries.

The Watford School Board have adopted plans by Mr. C. P. Ayres, of that town, for new schools at Callow Land.

Messrs. Newman and Newman, of Tooley-street, London Bridge, are the architects for the New Mendham memorial schools, to be built in Emmanuel parish, Hastings, for the Rev. Sholto Newman.

M. V. Palmaroli, a well-known Spanish painter, has been appointed director of the Madrid Gallery in the place of M. F. Madrazo, deceased.

A new building erected by the Manchester School Board in Ashton Old-road, Openshaw, was formally opened on Wednesday week. It provides accommodation for 1,000 children in three departments, the central-hall principle being adopted.

Mr. Samuel Sandars, J.P., of 7, De Vere-gardens, Kensington, and Chalfont Grove, Bucks, who recently died, leaving upwards of £256,000, has bequeathed a picture, "Tobit and the Angel," by Elsheimer, to the National Gallery; his picture, "Faith, Hope, and Charity," by Rubens, to his wife for life, and then to the Fitzwilliam Museum, Cambridge; and there are specific bequests of valuable books, manuscripts on vellum and silk, &c., to the Fitzwilliam Museum, the Cambridge University Library, and the library of Trinity College, Cambridge.

An extensive block of mercantile and shipping offices, occupying the site of Nos. 96, 97, and 98, Leadenhall-street, was opened on Monday by Alderman and Sheriff Sir J. Dimsdale. There are in the new building, of which Mr. Delissa Joseph is the architect, 105 rooms, and the structure is seven stories high, the area being about 7,000ft. The elevation, which is in Portland stone and granite, is of Free Classic design.

The Stockport town council decided at their last meeting to accept the tender of Messrs. T. and W. Meadows, Heaton Norris, amounting to £20,360, for carrying out contract No. 3 of the extensive scheme of sewerage now in progress. The council decided to join in the protest against the action of the Cheshire county council in resolving to spend about £80,000 in extending Upton Asylum, near Chester.

A TWO-HUNDRED-FOOT STEEL CHIMNEY.

WE herewith illustrate a 200ft. steel chimney recently built for a manufacturing plant, and figured in the *Engineering Record*. The contractors were Messrs. Riter and Conley, of Pittsburg, Pa., and the chimney was built for the Westinghouse Air Brake Company, at Wilmerding, Pa. The stack is designed to resist a wind pressure of 50lb. per square foot, with a factor of safety of 4. The material is punched and formed in the shops, but no riveting is done there excepting on the anchor brackets and other small parts. The ladder, for instance, is shipped in lengths of 15ft. or 20ft. The work is erected by inside scaffolding with a centre derrick for raising the sheets, and outside cages for the workmen which are hung on trolleys running on the edge of the shell. These are raised by the derrick as each course is added. When the stack is finished it is painted from a swing carriage suspended from the trolleys which run on the zee bar underneath the top ornament.

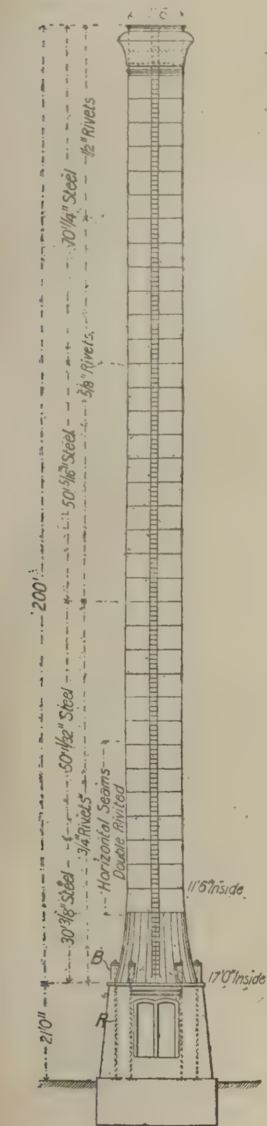

FIG. 1

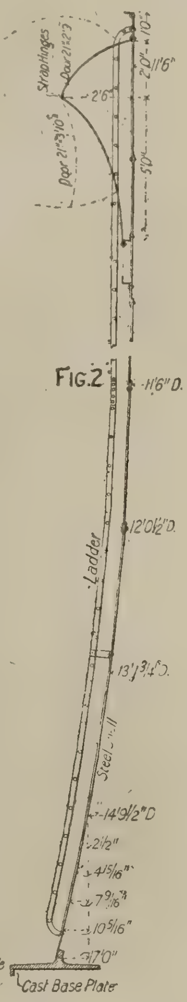

FIG. 2

Fig. 1 is a general elevation of the completed stack. The seams are single-lap riveted throughout except when otherwise marked. Fig. 2 shows the curved sections at top and bottom. Fig. 3 shows one of the 24 tapering bottom plates and one of the eight anchorage brackets B, Fig. 1, which make connections for the 2⅜in. round holding down bolts R, which penetrate 20ft. into the masonry pedestal and bear against the built-in stiffened anchor plates. Fig. 4 shows the cast plates for base and coping.

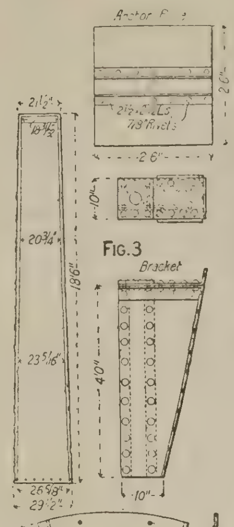

FIG. 3

BOOKS RECEIVED.

Engineering Construction in Iron, Steel, and Timber, by W. H. WARREN, Challis Professor of Civil Engineering, University of Sydney, &c. (London: Longmans, Green, and Co.), is a large octavo volume, well printed and illustrated, intended as a textbook for students in technical colleges and universities, and for those engaged in constructional iron and steel work. Prof. Warren fully and comprehensively deals with his subject, availing himself freely of the works of many authorities in this country and America and Australia. The chapters on strength, elasticity, and safe-working stresses in iron and steel and timber are thorough, and the most recent experiments are recorded. The methods of determining stresses in structures, bending and shearing stresses on beams and girders, moments of resistance are clearly put before the student by the help of diagrams, and without an unnecessary amount of mathematics. The examples are valuable, and will give the means of enabling the student to see what real progress he has made, and whether he has mastered the principles. These examples illustrate the design of the most important structures in iron, steel, and timber. The chapter on bending moments gives the student a clear view of each case of loading, with their respective diagrams, representing bending moments and shearing stresses. Examples of bridges of small span, braced girders, bowstring girders, swing bridges, arched and suspension bridges are among the various subjects treated. As an engineering textbook, Professor Warren's treatise will take a high place.——*Theoretical Mechanics, Solids*, by J. EDWARD TAYLOR, M.A., B.Sc.Lond. (London: Longmans, Green, and Co.), is an introductory manual on theoretical mechanics, dealing mainly with solids. The author has kept in view the Science and Art Department's syllabus for the elementary stage, and has furnished a good selection of worked-out examples, and of questions and answers. The requirements of the London University matriculation examination have also been studied. One great merit of this book is the numerical examples given in each chapter. Thus the examples worked out in treating the polygon of forces, the moment of force and parallel forces are more likely to engraft the principles on the mind than a verbal explanation. The mechanical powers, the pulley, inclined plane, work done by a machine, motion of falling bodies, laws of motion, &c., are explained with the aid of clear diagrams. The statement and illustration of certain laws are concise and to the point, and unnecessary verbiage is dispensed with. This book will be found a useful elementary treatise for students of architecture and engineering. The price is 2s. 6d.

* * *

OBITUARY.

BY the death at Plymouth of Mr. EDWARD OPIE, at the age of four-score and four, another of the few remaining artists of the old Devon and Cornwall school is lost to us. He belonged to a family of artists, of which the most distinguished was John Opie, R.A., his great uncle. Born at St. Agnes, he was at the age of 16 sent to study in London, where he was introduced to James Northcote, R.A., and Sir Thomas Lawrence, P.R.A., who allowed him to inspect the pictures in his study. Subsequently Opie went to Norwich, where he was under the tuition for six months of G. P. Briggs, R.A. By this time he had become a popular portrait painter amongst the richest families in Cornwall, and many of his works hang upon the walls of country family mansions. He has painted four generations of the St. Aubyn family, including the present head—Lord St. Levan. His first contribution to the Royal Academy was in 1839. Since that year, with one exception, at least one of his pictures has always been accepted. Opie settled down in Plymouth about 1840, and assisted Mr. Philip Mitchell, R.I., who still survives, in founding a local society of painters. Deceased had the privilege of assisting in the training of several distinguished artists now alive, including Mr. J. C. Hook, R.A. Deceased was a widower, and leaves no children.

THE death is announced of Mr. ALFRED WILLIAMS, C.E., the head of the firm of Alfred Williams and Co., of Bankside, Southwark, who has been for many years closely identified with that branch of the profession which relates to gas engineering. His death took place on Friday morning last, at the age of 68, he having been in failing health for some time past. Mr. Williams was one of the founders of the Society of Engineers, and since its inauguration in 1854 has held the position of honorary secretary and treasurer, in which capacity he has rendered the society marked service.

THE death is announced from Paris of M. EDMOND GUILLAUME, architect to the Louvre, and Professor at the School of Art. He was born at Valenciennes in 1825; was sent in 1861 on an archæological mission to Asia Minor; in 1864 designed the Place Clichy Monument, and from 1867 was architect to various public buildings. He was the author of a history of art and ornamentation.

* * *

The new graving dock at Grimsby, belonging to the Manchester, Sheffield, and Lincolnshire Railway Company, will be opened on Wednesday next, August 1st.

The Canon Hale Memorial Church, Richmond, Surrey, is seated throughout with chairs of special design, and fixed to the floor in folding rows. The contractors for the seating were Messrs. West and Collier, church furnishers, Hambleden, Henley-on-Thames. The seating required for St. Werburgh's, Derby, and the temporary choir fittings, were also supplied by Messrs. West and Collier, Hambleden, Henley-on-Thames. St. Hilda's Church, Sunderland, has been seated throughout by the same firm, and the new Church of St. Aldhelm, Branksome, Bournemouth, is seated with chairs and fixed in rows, the contractors for the seating being Messrs. West and Collier, church furnishers, Hambleden, Henley-on-Thames.

Building Intelligence.

Carlisle.—The memorial stone of the new Fisher-street Presbyterian Church, which is about to be reconstructed from plans by Mr. T. Taylor Scott, of Carlisle, was laid on Thursday in last week. The front of the church will be brought forward to within a short distance of the street line; the roof will be reconstructed, and at the east end there is to be a chancel for the organ. The street façade will be entirely new in style; it is to be Transitional Gothic. The gallery itself will be entirely new, and the church will be newly seated, accommodation being provided for 760 worshippers. The new ceiling will be divided longitudinally into three sections, the nave roof being semi-polygonal in outline, and divided into bays by principals, whilst the roofs over the two side aisles will also be open-boarded and divided into panels. The contracts already entered into bring up the cost to about £2,650. Messrs. W. and H. Davidson are the contractors for the building, joinery, and carpentering.

Lexden.—The new chancel of the parish church of Lexden, a suburb of Colchester, was consecrated on Thursday in last week. The church itself was built at the beginning of the present century. Some time since the west gallery was remodelled and reseated, and the space below was furnished with open benches. Two years ago these improvements were continued by the removal of the low, whitewashed ceiling, and the erection of an open roof above. The small recess which served for a chancel has now been taken down and a new one built. The new chancel consists of choir, sanctuary, north aisle and ambulatory, beyond which still remains to be added a south aisle. Over the ambulatory is an organ-loft and minstrels' gallery. The structural work has been carried out by Messrs. N. Saunders and Son, of Dedham, from designs furnished by Mr. J. C. Traylen, of Stamford. Mr. G. Spearman, of Lexden, has superintended the building as clerk of the works. The style is Early Perpendicular, and is partly adapted from the beautiful abbey church of Sherborne. The addition is built of the local flint-work, with Box stone dressings and bands intermixed. The east end is an example of Perpendicular work, and the window is enriched with stone carving, both internally and externally. Round the outside arch of the window head is a crown of twisted thorn, with shields at intervals bearing emblems of the Saviour's Passion. The window, which consists of ten lights divided by a transom, is filled with stained glass from the works of Messrs. Heaton, Butler, and Bayne, and illustrates the Crucifixion and other scenes of the Passion. The pavement of the choir and sanctuary is laid in marble, and the steps are of Derbyshire polished marble, enriched with Devonshire red, Irish green, and Italian white. This is the work of Messrs. Martinenghi and Gilhardi, of Milan, who have introduced some of their mosaic. The interior of the east wall above the floor is formed of Bath stone and alabaster in alternate bands. In the recess of the east window and above the retable is a hanging, designed and executed by Mr. William Morris. All the fittings of the choir are temporary.

Manchester.—The memorial-stones of two new Board schools — one in Queen-street, Bradford, and the other in Holland-street, Newton Heath, were recently laid at Manchester. The Queen-street school, which is to cost £7,500, will accommodate over 500 children; and the school in Holland-street, which is to cost £14,000, will have places for about 1,200 children. The Queen-street school is being built on a triangular site, in close proximity to an existing Board school. It is a one-story building, with a central assembly-hall, on the sides of which are arranged nine classrooms, providing accommodation for 528 scholars. At either end of the hall are placed the entrances, cloakrooms, and teachers' rooms. A manual instruction room, 36ft. by 24ft., is provided. The school has been kept studiously plain and inexpensive in character, both inside and out. The classrooms are separated from each other by glazed sliding partitions, and from the central hall by a series of arches filled with glazed screens. The floors are laid with wood blocks. The building is heated and ventilated by hot air. The architect is Mr. H. Lord, and Messrs. R. Neill and Sons are the builders. The Holland-street school is two-storied, and, like the one in Queen-street, is planned on the central-hall principle. In the basement there is a manual instruction room, 59ft. by 25ft. There are eight classrooms and two teachers' rooms on the ground floor, and nine classrooms and two teachers' rooms on the first floor. Provision is made for throwing two, three, or four classrooms into one, if necessary. The heating throughout will be by means of open fireplaces. The entire cost of the structure, including site, is estimated at £14,000. The architects are Messrs. Woodhouse and Willoughby, and Messrs. Neill and Sons are the contractors.

St. Alban's. — The Hertfordshire County Council have purchased the Beastney and Hill End Farms in the parish of St. Peter at St. Alban's, and having an area of 175 acres, as a site for a new pauper lunatic asylum, and have appointed as their architect Mr. George T. Hine, F.R.I.B.A., of Parliament-street, Westminster, and of Nottingham. His remuneration is to be at the rate of five per cent. on the cost of all work done under his direction up to £50,000, and four per cent. on any further expenditure; this payment to include cost of plans, taking of levels, travelling, and all other out-of-pocket expenses. The Council have decided to provide accommodation in the new asylum for 400 patients, with an administrative department adapted for 800, the kitchens, laundries, recreation rooms, and chapel to be constructed with a view to their eventual enlargement; the plans to be arranged for the accommodation of 800 patients, and to be so submitted to the Lunacy Commissioners.

CHIPS.

A young man named F. W. Mawer, of Hope Cottage, Lime-street, Tettenhall, was killed by a fall from Blakenhall Church, on Monday. The deceased was a carpenter in the employ of Mr. Gough, builder, Dudley-road, who is placing a new clock in the tower of Blakenhall Church, and while Mawer was descending a ladder, he slipped and fell, incurring injuries that were almost immediately fatal.

A faculty was granted in the York Consistory Court, on Thursday in last week, to the rector and churchwardens of Stockton-on-Forest to take down the greater part of the church, which has no chancel and is in a bad state of repair, and to rebuild and refit the edifice.

The Clarence Park recreation ground at St. Alban's, given by Sir Blundell Maple, M.P., was formally opened by the Duke of Cambridge on Monday.

The rural sanitary authority at Tiverton have instructed Mr. J. Siddalls, C.E., of Tiverton, to prepare plans and specifications for the drainage of Cullompton, and have applied to the Local Government Board for sanction to borrow £2,000 for carrying out the works.

The Sutton (Surrey) local board have increased the salary of their surveyor, Mr. Albert D. Greatorex, Assoc.M.Inst.C.E., from £250 to £300 per annum.

New art schools are being erected at Wrexham, and special consideration has been given to the ventilation, which will be effected on the Boyle system, the latest patented improved form of the self-acting air-pump ventilator being adopted for the extraction of the vitiated air.

The Lambeth board of guardians have accepted the tenders of Messrs. Galloways, Limited, and Mr. W. Neil, for the new work at their Renfrew-road workhouse, the former supplying the boilers and carrying out the engineers' work, and the latter undertake the new chimney-shaft and builder's work. The consulting engineer under whose specifications the work will be carried out is Mr. E. H. G. Brewster, of Delahay-street, Westminster. The amount of the respective tenders was £1,500 and £1,906, making a total of £3,406.

On Tuesday the members of the Bristol and Gloucestershire Archæological Society commenced their annual meeting, which is held this year at Ledbury.

A block of new board schools at the Green, Darlaston, was opened on Tuesday. The buildings are arranged to accommodate 600 children in three departments, and are supplied with the usual classrooms, cloak-rooms, and conveniences. Externally, the principal façade is towards the Willenhall-road, and is surmounted with a lofty tower and flèche, which is utilised for ventilating purposes. The material used is red brick with stone dressings, and the style is a free rendering of the Renaissance. The architect is Mr. C. W. Joynson, Darlaston and Wednesbury; and the builder, Mr. T. Lees, Darlaston; and the cost is estimated at £5,000, including furnishing.

COMPETITIONS.

Bristol.—The Finance Committee of the Bristol Corporation have awarded the first premium of £50 in the competition for laying out the central space at St. Augustine's to Messrs. W. J. Taylor and H. I. Weston, of Southampton, but no plan has at present been definitely recommended to the council for adoption. The site is divided into three parts; the end portions are circular, and are separated from the central portion by short roads 45ft. wide. The southern circle is about 130ft. in diameter. The centre of this space is occupied by a raised fountain basin. A wide gravel walk, with seats, runs round the fountain and statues. The circle at the northern end would be similar, but smaller.

Wednesfield.—A special meeting of the Board was held on Monday night to consider the plans for a new board school at Wednesfield. A letter was read from Mr. E. R. Robson, the consulting architect to the Education Department, who said he had examined the ten sets of plans sent in, and he placed those signed "Plan" and "Creon" first and second. He did not, however, recommend any of the designs, and suggested that the lines of a ground plan which he appended to his report should be followed. It was decided to ask the whole of the competitors to prepare pencil sketches based on Mr. Robson's plan.

Winwick Asylum, Lancashire.—A special meeting of the Lancashire Asylums Board was held on Friday in the County Hall, Preston, to consider the report of the Winwick Asylum Committee upon the plans and estimates for the new county asylum at Winwick. Mr. C. H. Howell (architect to the Commissioners in Lunacy) recommended three out of 22 competitive plans sent in for consideration, and placed them as follows:—Messrs. Giles, Gough, and Trollope, London, original estimate £258,900, amended ditto £239,809, rate per bed £118 15s. 2d.; Mr. G. T. Hine, London, original estimate £223,914, amended ditto £234,464, rate per head £117; Messrs. Henry Crisp and Oatley, Clare-street, Bristol, original estimate £300,200, amended ditto £240,466; rate per head £125. Of these the committee recommended the board to accept Messrs. Crisp and Oatley's plan as being the most suitable. The chairman said there was a discrepancy of £76,000 between the lowest and highest original estimate, and one of £13,000 between the lowest and highest amended estimates. The committee believed that by alterations that discrepancy could be reduced, or they would not have been so unanimous in their decisions. After some discussion it was decided "That the report of the Warwick Asylums Plans Committee be received and adopted, and that a committee be appointed with power to confer with the architects on the plans, and submit the same to the Commissioners in Lunacy for their approval."

* * *

Major-General Crozier, R.E., Local Government Board inspector, held an inquiry at Hinton Charterhouse on Tuesday, with regard to the application of the Bath Rural Sanitary Authority for power to borrow £1,550 for works of water supply at Wellew and Hinton Charterhouse, and £1,500 for drainage works at Freshford.

At Monday's meeting of the Huddersfield town council, the health committee reported that fifty-six competitive designs for an infectious diseases hospital at Mill-hill had been sent in, and that Dr. Whitelegge, of the West Riding county council, had consented to act as medical adjudicator, and that Mr. Alexander Graham, of Carlton Chambers, Regent-street, S.W., would act as architectural adjudicator.

At Thirsk Sessions, on Monday, the Birdforth highway board obtained a verdict for £75 and costs against Joseph Howe, contractor, West Hartlepool, for extraordinary traffic on a high road at Sand Hutton, by using a traction engine during the building of Breckenborough Hall.

Mr. Justice Collins, at the Manchester Assizes on Thursday in last week, delivered judgment with reference to the pollution of Lake Windermere. The case was brought by the owner to compel the Bowness local board to abstain from putting their sewage into the lake. The judge said it was admitted that the board was passing sewage into the lake, after subjecting it to a process, at the rate of 100,000 gallons a day. He decided that the effluent in its present form left something to be desired. He believed there were means available for improving it. He made the order asked for, but suspended it for six months, to enable the defendants to perfect their system of purification.

ARCHITECTURAL & ARCHÆOLOGICAL SOCIETIES.

Northern Architectural Association.—The members of this association held their annual excursion on Saturday, their destination being Thirsk. Twenty-six members, coming from Newcastle, North and South Shields, Sunderland, Durham, Morpeth, Middlesbrough, Leeds, and Raby Castle, left the Central Station, Newcastle, in a special saloon carriage attached to the 9.30 a.m. south express on Saturday. Conveyances and brakes awaited them at Thirsk. The members were driven to Coxwold (passing Shandy Hall), where the church was inspected; they then proceeded to Byland and Rievaulx Abbeys, where a very pleasant afternoon was spent. The association afterwards returned to Thirsk, and dined at the Fleece Hotel.

S.A. Association of Engineers and Architects.—The second annual meeting of the South African Association of Engineers and Architects was held at Johannesburg, S.A.R., on June 27th ult., Mr. A. H. Reid, president, in the chair. The report spoke of continued progress; during the year 17 members were elected, against which there were two losses by death, two by resignation, and two written off for non-payment of subscriptions, leaving a total of 56 against 43 last year. The headquarters have been removed to the Equitable Chambers, Rissik-street, Johannesburg, and the Association is now seeking to obtain from the Government a charter of association.

◆

CHIPS.

The baths erected at the rear of his workshops in Adelaide-road, Andover, by Mr. F. Beale, a local builder, some nine years ago, were recently destroyed by fire. They have just been reconstructed on an enlarged scale, and were reopened on Thursday in last week. The swimming-bath is 60ft. by 20ft., and has a tiled bottom. Over the twenty dressing boxes are galleries seated for 140 people. The room itself is 76ft. by 38ft., and 30ft. in height, and adjoining is a suite of private baths.

On Friday a special service was held in Trentham Church for the purpose of dedicating the new organ which has been presented to the church by the Duke of Sutherland. The instrument, which has been erected by Mr. J. J. Binns, of Bramley, near Leeds, has cost about £1,000. The specification of the organ was drawn up by Mr. J. B. Lott, organist of Lichfield Cathedral.

A large memorial brass is about to be erected in St. Michael's Church, Coventry, in memory of 4 Bishops of Mercia, 31 Bishops of Lichfield, 6 of Coventry, 27 Bishops of Lichfield and Coventry, and 4 of Worcester. It will also contain the heraldic arms of the Archbishop of Canterbury, and will record events from the creation of the See of Mercia from the year 656 to the present day. Messrs. Stokes and Bradley, of Wolverhampton, are carrying out the work.

Herr Karl Roux, a well-known painter of animals and idyllic scenes, and manager of the picture Gallery at Mannheim, died there of typhus fever on Monday.

The new recreation ground at Stanningley, one of the most recent acquisitions of the Leeds Corporate Property Committee, was opened on Saturday. The land, which has been well laid out, is thirteen acres in extent, and cost the corporation £5,000, while further sums have been incurred in the erection of boundary walls and a lodge.

Hackney Marshes were opened as a public recreation ground on Saturday, by the chairman of the London County Council. They have an area of 337 acres of flat meadow land intersected by the river Lea, and have been acquired at a cost of £75,000, two-thirds of which has been contributed by the county council, and the remainder by the Hackney district board, the lord of the manor (the vendor), and private donors.

Norwich city council on Tuesday week elected Mr. A. E. Collins, of Reading, city engineer and architect, at a salary of £600. A gratuity of 200 guineas was voted to Mr. Buchan, the late engineer, who has retired owing to failing health.

The Duke of York will lay on Saturday, Sept. 8, the foundation stone of the new General Hospital at Birmingham. Mr. Hemman, of that city, is the architect, and the builders are Messrs. Barnsley and Son, also of Birmingham, whose tender for the superstructure was accepted in March last at £177,888, and by whom the foundations have already been laid under a separate contract.

The scheme for the purchase of Turner's "Ancient Italy," for the Louvre, has failed and been abandoned. Although the picture has been for some time on view at Paris, the £8,000 required is not forthcoming.

Correspondence.

ASSISTANT SURVEYORS, WAR OFFICE.

To the Editor of the Building News.

Sir,—I hope you will allow me to correct an error in my letter of last week. The number of years necessary to rise from the bottom of the Assistant Surveyor class into the second class should have been 28, and not 18, years; this, with the 12 years necessary to reach the first class, makes 40 years in all to reach the ultimate prospect of £500 a year.

A civil servant must retire at 65, and may be retired at 60 years of age. When I stated that a married surveyor might find himself £150 out of pocket when proceeding on foreign service, I meant £150 both out and back, making £300 in all. This illustrates how idle it is to dilate on the extra duty pay allowed in the Colonies.—I am, &c.,

One Who Was In It.

Sir,—I apologise for continuing a subject which, through your kindness, was so well ventilated in these columns last year; but the warning of "One Who Was In It" carries a deeper significance to the readers of your paper beyond the mere grievances of a much-abused body of public servants, however great these may be.

It is complained that the War Office does not treat the members of our vocation properly; yet if architects and civil engineers do not adopt Registration, with its attendant compulsory examinations, they have no means of enforcing that respect and protection which is their due as professional men.

Notwithstanding the great advances made in the profession, our just claims are still ignored. We all know how Lord Palmerston bullied Sir Gilbert Scott; how the treatment of Edmund Street over his law courts hastened his death; of the setting aside of the architect of the Imperial Institute; and how, only yesterday, Mr. Wolfe Barry was so inadequately rewarded. And, presumably following our example, the War Office itself does not compel its own military engineers to pass any real test as regards their technical efficiency, and whose training during a period of somewhat under *two years* is nothing short of antediluvian. Hence these officers shirk all technical labour, and the dirty work connected with it; but, still wishing to pose as the architects of the army, and having the authority, they do all in their power not only to *suppress* their unfortunate surveyors, but a whole host of "temporary" architects, surveyors, draughtsmen, clerks, and foremen of works as well. The Royal Engineer Civil Staff is but another name for the Army Works Department. Thus the R.E.'s act, for their individual gain, and because their ruling in this establishment affords them easy positions with increased pay, where they are exempt from disagreeable military duties. In short, they hide the workers and blind the eyes of the public; and to be on the safe side, they cunningly appointed H.R.H. the Commander-in-chief honorary colonel of their corps.

It would, no doubt, be interesting to your readers to know the names of some of these Tom Pinches. The greatest is Mr. E. Ingress Bell, F.R.I.B.A., First Class Surveyor, R.E. Civil Staff, whose partnership with Mr. Aston Webb is celebrated. It is to this clever architect the type-plans of most of our modern barracks can be accredited. The fine barracks at Southsea, and at Grangegorman, Dublin, were designed by the late Mr. J. Mechelen Rogers, A.R.I.B.A., who died in 1889. Mr. Walter H. Tregellas, formerly chief military draughtsman at headquarters, also carried out innumerable schemes. The new army buildings at Parkhurst, Isle of Wight, are from the designs of an assistant surveyor, whilst those near Belfast are likewise being planned by two civil architects. The same story can be repeated of the recent barracks at Norwich, Knightsbridge, Hyde Park, Aldershot, Curragh, and of every other military station in the kingdom.

It is idle for R.E. surveyors to hope to get their grievances redressed as long as the Royal Engineers are permitted to hold sway in what should be a properly constituted Army Works Department, attempting to conceal the real workers of that department, and persistently opposing that reform which would pull to pieces their self-glorifying administration. What can be expected of men who probably have never seen one brick laid upon another, and who do not understand the commonest terms of building construction; men whose interest in the housing of our soldiers is so vast that their visits to works in progress are few and far between, and then only when compulsory? Should a surveyor, or any other official, refuse to accede to the wishes of his engineer officer, a confidential letter is forwarded to headquarters, reporting the unfortunate victim "incompetent." Such are the abuses of this tyrannical system!

What has become of that scheme for the improvement of this branch of the service formulated by the late Sir Lothian Nicholson, R.E., and now so carefully pigeon-holed by his successor? Is this concealment evidence of the desire of the Royal Engineers to improve the public service of their country, or evidence of their lust to benefit themselves only?

Your correspondent has made a clerical error in stating it will only require 18 years to rise from the bottom of the lowest class into the second class; in other words, to rise from £180 to £300 per annum. He probably meant 28, but it will really take 33 years!

As long as Royal Engineers are encouraged to pose as qualified architects and civil engineers, so long will Registration be delayed, and these anomalies allowed to exist.—I am, &c.,

One Who Is In It.

SEWER VENTILATION.

Sir,—I read with interest in your issue of 13th inst., the summary of Dr. F. W. Clark's report on Sewer Ventilation, and also Mr. Hurst's remarks thereon in your last number. Having been engaged for some nine months in experimenting on this matter for Mr. Caink, our city engineer, as well as in ascertaining the views and practice of municipal engineers elsewhere, I should like, with your permission, to give the results of my experience.

There is little doubt but that the days of the ordinary street-level ventilator or grating are numbered. The theory that a sewer should resemble, as much as possible, an open trench, and that the condition of the air within it must be brought as nearly as may be to that of the outside atmosphere, is no longer a universal article of faith. Mr. Mansergh, by recent experiments, has proved that, even when gratings or shafts are provided at an average distance apart of only 82 yards, and on well-constructed sewers, nuisance from those gratings is not avoided. In Worcester we have proved that it is not only not avoided, but that it is actually caused or aggravated by the frequency of the openings—which conclusion, as Mr. Hurst remarks, common sense would lead one to expect.

For six months I made almost daily anemometric tests on a troublesome sewer here, which, in a length of less than 300 yards, is fitted with five ventilating gratings. We have never detected any pressure; some of the shafts *always* acted as inlets, and from the others came powerful currents and very bad smells. Sometimes the nuisance was at one shaft, sometimes at another; it would shift its quarters and change the direction of its current sometimes in the course of a few minutes, obedient, doubtless, to the vagaries of the wind, which never blows exactly alike for ten consecutive seconds.

This action of the air is simply a gratuitous drying and scouring of an ever-foul pipe into the street or, as Mr. Hurst happily expresses it, "doing the best to evaporate the sewage into the atmosphere." It happens everywhere with ordinary street ventilators, and many surveyors are getting tired of the process and the endless complaints it causes.

One result is the tendency to close the surface gratings altogether, and substitute high pipes where permission for their erection can be obtained. The nuisance is transferred from ground level to the house-tops; complaints often cease, and it is presumed that all is well. Will it be so in reality?

Will not these shafts, exposed as they are to the full action of the wind, induce currents of air through the sewers more powerful than those we have already? Will they give a more distributed exit for foul air than do the street gratings? Will not first one and then another pour poison from its mouth or from any defective joints, while its neighbours act as inlets for the time? Will not the tops of these pipes in fact be simply bad street gratings stuck up 10ft. above our windows instead of 20 or 30ft. from our doors?

Complaints may diminish, it is true: "something has been done," and, besides, instead of assailing the nostrils of fussy citizens on their walks abroad, the poison is now instilled into their bedrooms as they sleep, or, as Mr. Hurst points out, into their water cisterns.

"Get rid of the stinks, and we will chance the microbes," was the dictum of one surveyor to me, and the remark has been echoed by others—fortified, perhaps, by Mr. Parry Law's recent report to the L.C.C., wherein he states he finds sewer air comparatively free from germs.

Certainly, if we are to provide against a nuisance only—merely to "stop a stink"—high shafts may answer the purpose, though that may be doubtful as they become old and out of repair; but if sewer emanations be dangerous to health, it is surely better to take one's chance of a whiff in the street than to have a continuous supply laid on over one's dwelling to sink, it may be, as soon as it escapes from the inducing current in the shaft or to be blown down by the wind as smoke so frequently is.

The street-gratings loudly invite attention; the surveyor proclaims them a nuisance, and then the medical officer indicts them as a danger, and quotes diphtheria death-rates. If the poison be sent up aloft where it may be "out of smell," it will very likely drift "out of mind" also, but it will be there nevertheless, and more dangerous than before, because unnoticed.

As the result of his Worcester experience and experiments, and after trying everything else, Mr. Caink has decided to check the rush of air through the sewers by the insertion of cotton-wool filters in the street shafts. These, he finds, allow perfect relief or "breathing" to the sewer, and render innocuous the comparatively small amount of air which must pass out to equalise pressure, &c. The condensation of moisture which, unless guarded against, rapidly renders all sewer-air filters saturated and impervious, is prevented by a heat-equalising arrangement. The thing can be fixed without permission from any private person, and remaining the property of the local authority and in official hands, it has proved a satisfactory solution of this troublesome problem.

I am, &c., W. E. Buck.

Shrub Hill, Worcester.

◆

CHIPS.

Two stained-glass windows, the work of Messrs. Heaton, Butler, and Baynes, of London, were dedicated at St. James's Church, West-end, Southampton, last week. The subject of one, a memorial to the late Dr. Browne, Bishop of Winchester, is "Christ and the Doctors in the Temple," and that of the other, also a memorial window, is "The Miracle at Cana."

The foundation-stone of the Jenkins memorial hall and institute, at Aberdare, was laid last week. It is being built by Messrs. Bowen, of Hereford, from plans by Mr. Wakely, of Merthyr.

Mr. Passmore Edwards has given instructions for the erection of an art gallery at Newlyn which shall be worthy of the reputation the Newlyn school has gained in the art world. The primary object of the new gallery, of which Mr. James Hicks, M.S.A., os Redruth, is the architect, is the bringing together of the best work executed by the Newlyn men. Stanhope Forbes, A.R.A., W. J. Bramley, A.R.A., and other painters of repute, are acting as advisers in the matter.

The new board schools, Lower Gornal, near Dudley, are being warmed and ventilated by means of Shorland's patent Manchester grates, the same being supplied by Messrs. E. H. Shorland and Brother, of Manchester.

Intercommunication.

QUESTIONS.

[11182.]—**Market Fittings.**—Will some reader kindly give me the names of one or two modern markets well fitted up with fittings, lock-up shops, benches, &c.? I am anxious to see the most approved arrangements that have yet been tried.—Magazine.

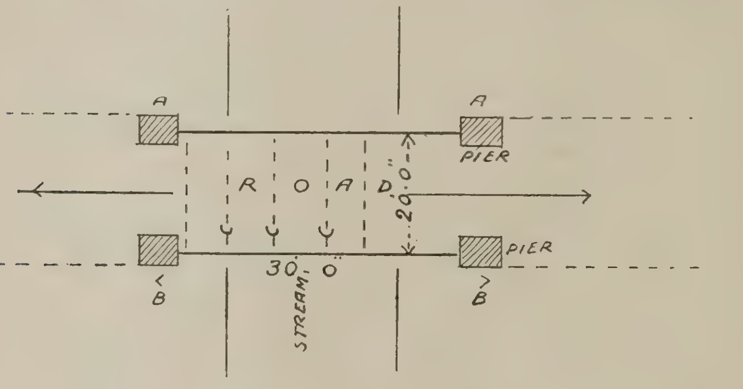
[11183.]—**Levelling with Theodolite.**—Will any of your readers who have done much levelling with a theodolite tell me what, if any, disadvantages the method has, as against the use of an ordinary level.—Theo.

[11184.]—**Heraldic Supporters.**—I intend to have the town arms carved over the entrance to a certain public building. Would it be admissible for me to introduce heraldic supporters (such as two lions or figures) on each side of the shield bearing the arms, even supposing that, according to the strict laws of heraldry, there were no supporters to the shield bearing this town's arms? I wish to know if it would be considered erroneous to introduce such supporters?—L. and Y.

[11185.]—**Lightning Conductor.**—I have just had a conductor fixed on a house in a very lofty and exposed situation; but the top of it only stands a few inches above a chimney-stack, which is 6ft. by 2ft. Is this sufficiently high, and will some kind reader inform me as to the rule for fixing, and as to the extent of building protected by same? I am told only the portion within an angle of 45° is safe.—J. W. S.

[11186.]—**Sewage Filtration.**—Would some reader of the Building News kindly inform me where I could obtain particulars of the system of filtration of sewage through polarite, and its treatment with ferozone?—M.

[11187.]—**Bridge.**—Below is a sketch plan of a bridge over a stream in a country road. Will some experienced reader kindly tell me what load per foot sup. the girders should be calculated to sustain? There will be two main girders, A A and B B, with minor ones, C, between them at 2ft. 6in. centres.—Iron.

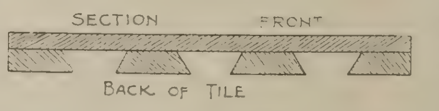


[11188.]—**Wood Furnace.**—Will some reader kindly say if he knows of a furnace specially suited to burning wood, and give the maker's name? What height shaft would be required? Does it consume its own smoke?—W. J. Easton.

[11189.]—**Dynamics.**—What is the formula for solving the following question? Will someone please say? A cricket-ball, weighing 5oz., is propelled at 80ft. a second, and is met by a bat weighing 35oz., the bat moving also 80ft. a second, and batsman exerting a force of 50lb., the figures in each case being assumed. What force, in pounds, does the ball exert on the bat?—Difficulty.

REPLIES.

[11178.]—**Fixing Tiles to Walls.**—Tiles are fixed to walls by means of cement, and held there by suction; but they often fall, as lately in the House of Commons. I have just in course of construction an arrangement for making dove-tail grooves in the back of tiles, of which I give sketch, and if these tiles are once fixed, they are fast for ever. An advertisement will be found elsewhere with my address.—S. Kluh.



[11181.]—**Wood Beams.**—The examples given by the drawings A and B in the last issue of the Building News of timber arches are, substituting other materials, very similar to a stone arch, in which the voussoirs are in one, although not necessarily uniformly one depth, and an arch of the same span, rise, and thickness of brick in which the depth is made up of several concentric rings of brickwork. I do not call to mind any instance of an arch worth the name being built of wooden voussoirs, as shown in drawing A; but the method shown in drawing B is well known as De Lorne's laminated principle, and very fairly-sized arches have been constructed successfully in that manner. The chief objection to that mode is the relatively small scantlings of the bent planks, and their consequently rapid deterioration and decay. On the other hand, owing to the cumulative amount of shrinkage due to that of each wooden voussoir, the tendency for them to deform the arch by partially sliding on their bed joints is obvious.—Philip Sheldon Strettoune.

Legal.

MOVABLE STRUCTURES.

The advisers of the London County Council seem to have surpassed themselves in their last effort at fussy interference. This was in the case of a summons against the firm of Humphreys (Limited), the well-known makers of movable structures in wood and iron. The complaint laid was that they had unlawfully erected and continued a wooden structure of a movable and temporary nature called a bungalow, upon a piece of ground at Knightsbridge, without having first obtained the license of the London County Council for that purpose. The facts were that the defendants had erected this bungalow on a piece of their own land adjoining their offices as a specimen of the buildings they sold, and to attract purchasers. It was made of wood and iron, with a floor and a roof, and was divided into four rooms, and it had a board up showing it was for sale. It had no foundation and no chimney, and was not used in any way for dwelling or other purposes, and was simply a sample of the bungalows the firm was ready to supply. The magistrate found that it was a wooden structure, placed where it was merely as a specimen of the wares sold by the makers, and on this ground he held that the Act did not apply, and dismissed the summons, as he considered that no offence had been committed.

The County Council, however, were not content with this result, for they appealed to a Divisional Court. As to the hardship of the case, their counsel argued that the Council would grant a license in all proper applications, and, further, that the makers of such structures could and should keep them out of London, and do without having any specimens to show buyers. After a very long and learned argument, which will seem to many people as much sheer waste of judicial time, as the litigation is waste of ratepayers' money, Wills and Kennedy, J.J., affirmed the magistrate's decision. They held that however technically the structure might be brought within the exact words of the section relied upon, as it was only put up for exhibition and was never to be used as a building in that place, the object of the statute was not touched. Of course, the Act was intended to apply to temporary and movable buildings; but only to such as were used for some purpose or other upon the spot where they had been erected. If this summons could have succeeded, no one could construct a summer-house, still less expose it for sale outside, without a special and separate license from the County Council in every case, and the Court rightly shrank from holding that this was necessary—at all events, yet awhile.

Fred. Wetherfield, Solicitor.

1, Gresham Buildings, Guildhall, E.C.

Note.—All questions for reply in this column must be headed "Building News," and must reach my offices, as above, by *Tuesday* morning to insure answer same week.

A. J. F.—Ancient Lights.—Prescription.—The Prescription Act has not been altered, and the term of user required to give a right to light and air under the statute is still 20 years without interruption. The 12 years to which you refer is the period given by the Statute of Limitations of Actions of 1874, and which was formerly also 20 years, but which is quite a different thing.

H. T. K.—Contract.—Gasfittings.—Unless there is some clause in the contract under which it can be supported, it would seem that the separate contractor for gasfittings under a subsequent contract could not be brought upon the premises while the contractor for the whole job is still carrying out his work, and against his orders—at all events, not without affecting his liability for damage or fire. Probably the contractor has a right to the exclusive possession of the premises until he has completed his contract.

Bill of Exchange.—Acceptor.—Endorsement.—If the bill has not been endorsed to anyone, the acceptor can only be sued by the drawer, and so, although the document has somehow got into your hands, you cannot sue upon it, unless you were authorised to endorse by the drawer, and did so, and have given value for the bill.

◆

It has been decided that the memorial to the late Lord Arthur Hervey, 69th Bishop of Bath and Wells, shall take the form of a recumbent figure to be placed in Wells Cathedral. Mr. Thomas Brock, R.A., stated that such a figure in best statuary marble would cost £1,000, irrespective of mounting, while an enthroned figure would cost £1,200 or £1,300. The family of the late Bishop have intimated that they will fill with stained glass two windows in the cathedral, near the entrance always used by the bishop, as a private memorial.

LEGAL INTELLIGENCE.

NON-ADHERENCE TO APPROVED PLANS. — At Chesterfield Borough Police-court, on Friday, Messrs. C. W. Rollinson, architect; W. B. Askew, builder; and A. G. Broomhead, accountant, answered to summonses taken out at the instance of Mr. Nicholas Dunscombe, borough surveyor, for erecting a dwelling-house in Clarence-road, an upper room in which differed from the plan approved by the committee of the council. Mr. Middleton said that the original plan of the building of Mr. Broomhead's house showed that the top room should be 8ft. 6in. in height, whereas the actual height was only 7ft. 1in. When spoken to by the borough surveyor, Mr. Broomhead stated that he did not know that he was guilty of any breach of the by-laws, as he left the entire matter with the builder. Mr. Rollinson handed in the original plan, and pointed out that there was nothing about 8ft. 6in. on that, whilst on the tracing being put in, the figures 5ft. 9in. at the side, and 11ft. 2in. at the apex were given, so that actually there was a difference between the original and what purported to be a tracing, and Mr. Rollinson asked if the Council had any regulation as to the height of rooms. Mr. Dunscombe said that it was left to the discretion of the building committee. He added that if plans were sent in, nothing less than 8ft. 6in. in height for a room would be approved. After a lengthy hearing, the Chairman said the Bench had come to the conclusion that there had been a misapprehension somewhere, and the defendants would only have the costs to pay. Mr. Rollinson said they were quite prepared to do that.

BUNGALOWS ON SALE, AND THE BUILDING ACTS.—LONDON COUNTY COUNCIL V. HUMPHREYS, LIMITED. —This appeal case, heard by Justices Wills and Kennedy last week, was one stated by a metropolitan magistrate on a summons under section 13 of 45 Vict. c. 14,of the Metropolis Management and Building Acts Amendment Act. The complaint was that the respondent from October 17, 1893, to February 22, 1894, at the west side of Hill-street, Knightsbridge, did unlawfully erect and continue a wooden structure of a movable and temporary nature called a bungalow without a licence first had from the London County Council, contrary to 45 Vict. c. 14, section 13, and 51 and 52 Vict. c. 41. The respondents are manufacturers and dealers in buildings constructed of wood and corrugated iron, and carry on business in Hill-street, Knightsbridge. They set up in March, 1893, on an adjoining piece of land belonging to them a bungalow 31ft. long, 22ft. to 25ft. wide, in height 17ft. to the ridge of the roof. The floor was of wood, the sides and ends consisted of wooden uprights and cross-pieces, lined on the inside with match-boarding and covered partly with corrugated iron and partly with wood. The interior was divided into four rooms. It merely rested upon the ground, and had no foundation and no chimney. The bungalow was erected for sale, to attract purchasers, and as an advertisement, but more particularly as a specimen building. It had a board on it notifying that it was for sale. The magistrate found as a fact that the bungalow was a wooden structure of a movable or temporary character, placed there merely for the purpose of sale, and as a specimen of wares sold by the respondents. He was of opinion, as a matter of law, inasmuch as it was merely exhibited by the respondents as wares which they had for sale, that upon the true construction of the 13th section of 45 Vict. c. 14, the respondents had committed no offence, and dismissed the summons. Mr. Daldy, for the County Council, cited "Stevens v. Gourley," "Hall v. Smallpiece," "London County Council v. Candler," and "London County Council v. Pearce." He urged that this was a "structure," and ought not to be erected without leave of the County Council. A license would be given in all proper cases. There was, therefore, no hardship. Another alternative would be for the manufacturers to keep such structures out of London in the same way gunmakers had their ranges for trying guns outside London. Mr. Poland said this house was merely part of the wares exhibited for sale. The cases cited dealt only with buildings used as buildings. There was no occupier here, no chimney, and no gas. People must see what they were asked to buy. Therefore it was necessary to set up the bungalow. The Court dismissed the appeal. Mr. Justice Wills said the structure came within the actual words of the section, but the authorities cited showed that that in itself was not conclusive. The question was whether the Act was intended to apply to structures that were not purposed to be used where they stood, and were only part of a manufacturer's stock-in-trade. It was impossible to draw a logical line; but the question was to be answered in each case by considering what was the purpose of the structure, and the object of placing it where it was placed. If the object was exhibition only with a view to removal when a purchaser could be procured, then the principle of the cases cited applied, and the Act did not affect it. Mr. Justice Kennedy concurred. Was one compelled to hold that this temporary building came within the operation of the Act? On the whole, he thought not. The structure was not intended for use on that spot. It was on the premises solely for the object of immediate sale. The Act was intended to apply to buildings movable and temporary, it was true, but only to buildings put up for use on the spot. If the Act covered this case, no one could construct a summer-house, or any kind of habitation for man, still less could they expose it for sale outside, without a particular license from the London County Council in each case. The decision of the magistrate must be affirmed.

THE SUTTON LOCAL BOARD V. HOARE.—This was a motion (before Mr. Justice North) for an interim injunction to restrain the defendant, a grocer, of 121, High-street, Sutton, from rebuilding his premises so as to come beyond a line prescribed by the plaintiff authority under section 155 of the Public Health Act, 1875. It is provided by that section that where a house or building, or the front thereof, in a street in an urban district is taken down in order to be rebuilt or altered, the urban authority may prescribe the line in which such house or building, or the front thereof, shall be re-erected. High-street, Sutton, is a narrow thoroughfare. Mr. Hoare had pulled down his house; he had sent in plans to the local authority for rebuilding on the old line. The board, however, prescribed a line for rebuilding some 6ft. behind the old line, and refused to pass the plans unless altered to conform to the prescribed line. Mr. Hoare had commenced to put in his foundations, and the plaintiffs commenced these proceedings. The defendant's case was that the board (as it must be inferred) were not acting *bonâ fide* in the exercise of their powers, because om each side of his house were comparatively new houses, and the board had not proceeded to lay down a general line in that part of the street to be carried out by the compulsory powers of the board under section 154 of the Act. It was argued on behalf of the defendant that it would be futile to put back only one house. Mr. Justice North said last Saturday it was obvious that what the local board was doing was with a view to widen the street as opportunity arose when houses were from time to time rebuilt, and what they were doing was precisely what they were empowered to do by section 155 of the Public Health Act. It was true they had an additional power under section 154; but the exercise of that involved their taking the whole of the houses abutting on the side of the street to be set back. He could not see that the requiring the house to be set back some 6ft. was at all an unreasonable exercise of the board's power, and he must grant the injunction asked for.

◆

A stained-glass window, which has been placed in the chancel of St. John's Church, West Bromwich, was dedicated last week. The window forms part of a series of subjects representing the burial and resurrection of Christ, and is the work of Mr. S. Evans, of West Smethwick.

The south chapel added to St. Andrew's Church, Lincoln, in 1890, was reopened on Saturday after completion and decoration in colour. At the entrance to the chapel has been fixed a carved oak screen, 15th-century style, designed by Mr. W. D. Pratt, architect, Nottingham, and executed by Mr. S. C. Basker, Lincoln, who has also done the other joiner's work. The floor is laid with polished oak. The walls are panelled 5ft. 6in. high in oak. The two stained windows on the south side of the chapel represent St. Stephen and St. Hilary. Four angels are painted on the east wall. The roof is panelled with floral decorations—in the centre panel the Holy Eucharist, and the side panels offering of incense. Above them in the clouds are cherubim and seraphim. Mr. Jones Davis, of London, was the artist.

The new assembly rooms at Ambleside have been opened. The work comprises large assembly room, 80ft. by 38ft., with spacious entrances and staircases at each end, and retiring-rooms for ladies and gentlemen, with lavatories over these rooms. There is a large committee-room and rooms for the caretaker, having a separate staircase. In the basement there is a large drill-hall of a similar size to the assembly-room, and 10ft. high, with a kitchen, pantry, and store-room under the retiring-rooms. There is an outside entrance to the drill-hall, and a good roomy staircase for the assembly-room, so that suppers, &c., can be provided when required, with direct access from the assembly-room. The building has been carried out with the local stone and green stone dressings, and have been well and substantially built by the contractor, Mr. Arthur Jackson, of Ambleside. Mr. A. D. Dawnay, of London, supplied the steel roof for the large room; Mr. Spencer, of Oldham, carried out the heating; while Messrs. Kershaw and Co., of Lancaster, supplied the whole of the ventilators and air-inlets. The whole of the work has been carried out from the designs, and under the superintendence of, Mr. Robert Walker, F.R.I.B.A., architect, Windermere, whose plans were selected in competition.

WATER SUPPLY AND SANITARY MATTERS.

BOLTON.—Consequent upon the attitude of the Mersey and Irwell Joint Committee as to the pollution of the rivers, the Bolton Corporation has for some time had under consideration various improvements in connection with the sewage works of the town. At Thursday's meeting of the Scavenging and Sewage Committee, the chairman and the engineer, Mr. H. L. Hinnell, C.E. (Hinnell and Murphy, Bolton), reported the result of an interview with Lord Derby's agent respecting the proposed purchase of land for the purpose of carrying out the filtration scheme. It was stated that terms had been arranged for the purchase of Rhode's Farm, Ringley, which covers an area of about 140 acres, and which is considered a suitable site for the new works. The works will be commenced as early as possible after receiving the sanction of the town council, and it has been decided to apply to the local government board for sanction to borrow £75,000 for the purpose of the undertaking.

DARTON.—Some time ago the Darton local board invited Mr. W. H. Radford, C.E., Nottingham, and Messrs. Duncan and Pickard, C.E., Leeds, to prepare competition schemes of drainage and sewage disposal for the townships of Darton, Kexborough, and Barugh. After consideration the board decided to adopt the scheme sent in by Messrs. Duncan and Pickard. They have therefore been appointed the engineers to carry out the works of drainage and disposal of sewage. The mode of purification is that known as the Carbonised Refuse System, combining therewith the disposal of town's refuse under Jagger's patent.

CHIPS.

The Cardiff corporation have adopted a scheme to form the Bute, the Penarth, and the Barry docks into a public trust. It is estimated that something like £7,000,000 will be necessary for the acquirement of the properties.

The opening services of the new Ebenezer Congregational Chapel at Cwmtwrch were celebrated last week. The building, which affords sitting accommodation for 750 people, has been erected by Messrs. Williams and Morgan, under the supervision of the architect, Mr. Owen Powell, at a cost of £1,400.

It is said that the London County Council are about to have the mound, or tumulus, in Parliament-hill-fields, Highgate—sometimes spoken of as Boadicea's Tomb—opened and scientifically examined, in order to determine, if possible, whether it is really a place of historic interest and worthy of still being preserved as such.

The Lord Mayor attended in state, on Monday, the reopening services of the Church of St. Stephen, Coleman-street. The seating accommodation has been increased, and an entirely new floor has been laid, beneath which is a concrete foundation; hot-water pipes have been fixed for heating the church, and the electric light has been adopted.

A scheme is on foot for the erection of a steel rope suspension bridge across the River Wye at Sellach, Herefordshire. Already a fair amount has been collected in the district, and application for grants have been made to the county council and the Great Western Railway. The plans show a suspension bridge with a clear span of 180ft., and necessary approaches to same; the design is light and pleasing. Mr. Ernest Davies, M S.A., of Hereford, is the architect.

A new four-dialled illuminated turret clock, striking the hours upon a bell fixed in the tower, has just been erected for the Acomb School Board, by Messrs. W. Potts and Sons, clock manufacturers, of Guildford-street, Leeds, and 22, Collingwood-street, Newcastle-on-Tyne. Messrs. Potts are also making a new illuminated turret clock for Hunstlet new board school, for the Leeds School Board, and one for Rufforth Church, near York.

The Lords of the Admiralty have for the tenth time awarded the contract for the supply of "Victor" metallic joints, and other asbestos goods, for use in Her Majesty's Navy, to the United Asbestos Company, Limited, Dock House, Billiter-street, London, E.C.

The theatre at Rochdale, which was burnt down some time since, is about to be rebuilt, from plans by Mr. Frank Matcham, of London, and will be reopened in November next.

The Commission on the Paris Exhibition of 1900 having decided that architects competing for designs may either retain or demolish the Eiffel Tower, M. Mascart, as a member of the Commission watching over that building till its reversion to the Paris Municipality in 1909, pleads strongly for its preservation.

A new church is about to be built at Kea, near Truro. Mr. A. Carkeek, of Redruth, is the builder, his tender having been accepted at £4,131, and Mr. G. H. Fellowes Prynne is the architect.

Our Office Table.

THE private view of the works submitted for national competition at the South Kensington Museum took place yesterday (Thursday). The number of works selected for competition is 3,605. Of the nine gold medals, one is given to Henry Mitchell, of Glasgow, for his design for a college, a design submitted in a late Soane Medallion competition. J. Benjamin Fletcher, of Leicester, wins one also for a nice series of ink sketches of doorways and other church details. Silver medals are awarded to Thomas S. Purdie, Glasgow, for a design for an exchange (Alexander Thomson's Travelling Studentship) in a severe Greek style; and to W. Tait Conner, also of Glasgow, for his Tite design for a royal mausoleum. Several other creditable designs are exhibited, and Glasgow contributes a number of works of merit. We hope to notice the architectural and other designs next week.

THE representation of the French School at the National Gallery, at present very meagre and inadequate, has been strengthened by the "Holy Family," by Eustache Le Sueur, presented this week by Mr. Francis T. Palgrave, and hung, on Monday, at the north-west corner of Room XIV. The work is numbered 1422, and measures 29in. in height by 19in. in width. The Virgin, clad in the traditional blue and red, stands on the left, supporting on her knee the Infant Christ. Opposite is St. Elizabeth, who is directing John the Baptist to raise his hands in the attitude of adoration towards his Cousin. In the background is St. Joseph, leaning on a long staff. The treatment is simple and broad, and the colouring pure and harmonious, although low. Le Sueur, of whose work this is the only example in the Gallery, was born in Paris in 1616, studied under Simon Vouet, was known as the "French Raffaelle," and died in 1655. With the exception of Nicholas Poussin, no French painter approached so nearly to the dignity of the Roman school.

AFTER many vicissitudes, and having undergone the ordeal of a month's investigation before a Select Committee, the London Streets and Buildings Bill of the London County Council has a fair prospect of passing into law, although shorn of many of its original provisions. The Earl of Morley, who has taken charge of the Bill in the Upper House, obtained leave on Monday to dispense with standing orders prohibiting the second reading of a private measure brought from the House of Commons after June 26th, and the Bill was accordingly read a second time on that evening.

THE Sheffield Corporation some time ago initiated a scheme for widening High-street, involving the purchase of eighteen blocks of property. Up to a month ago, as we stated at the time, settlements had been come to with sixteen of the owners; but terms were not settled between the corporation and Mrs. Younge, the owner of the Clarence Hotel and adjoining shops, in the occupation of Mr. Walsh. Arrangements were therefore made for an arbitration, and the proceedings were to have commenced on Monday; but on the parties meeting, a consultation took place, and it was agreed that the corporation should pay for 501 square yards of land required the sum of £28,500, and that they should give up certain important rights of light.

THE promoters of the Birmingham, North Warwickshire, and Stratford-on-Avon Railway have succeeded in proving the preamble of their Bill to the satisfaction of the House of Lords' Committee, as they had previously done to that of a Select Committee of the House of Commons, and there is little doubt that the Bill will receive the Royal assent. The accommodation the projected line will afford is urgently needed in the district, some eight or twelve miles wide, lying to the south-west of Birmingham, between the Midland and Great Western Railways. Its chief interest, however, is that it forms an important link in a new and direct route to London. The Bill gives powers for a connection to be made with the East and West Junction Railway from Stratford to Morton Pinkney, where it would meet the proposed line between London and Sheffield which is to be made by the Manchester, Sheffield, and Lincolnshire Railway Company, and for which the capital has just been raised. The route thus formed from Moor-street, Birmingham, to the Baker-street Station of the Metropolitan Railway Company would measure 115 miles, only three miles more than the North-Western route from New-street to Euston.

THE autumn congress of the Sanitary Institute is to be held at Liverpool from September 24th to the 29th. According to the programme we have received, the sectional meetings comprise sanitary science and preventive medicine, engineering and architecture and chemistry, meteorology and geology. Conferences will be held on sanitation of the passenger and mercantile marine service, on medical officers of health, municipal and county engineers, sanitary inspectors, &c., and an exhibition of apparatus and appliances relating to health and domestic comfort will be held. The council of the institute invite papers on subjects appropriate to the sections and conferences, and the co-operation of all interested in sanitary knowledge. All communications should be addressed to the secretary, Mr. E. White Wallis, F.S.S., Parkes Museum, Margaret-street, W.

THE notion of some builders, that by adding lime to cement mortar it is improved in cold weather, has been refuted. Many masons say that by adding a little lime to the mortar freezing would be averted; but when such mortar is spread over a cold stone or brick, the mortar would quickly freeze even though the water be warmed, for the coldness of the stones or brickwork would speedily rob the mortar of its heat. But by warming the stones or bricks the mortar may be kept from freezing for a considerable time, long enough, in fact, to allow the cement to set before freezing commences. An American builder (Mr. O. W. Norcross) warms foundation-stones by a jet of steam before laying them in cement in cold weather. A better and quicker way of heating the stones is said to be to pile the stones or bricks over a furnace in which a moderate fire is kept up night and day, the masons or bricklayers can then be supplied with hot bricks as the work proceeds, which enable the cement mortar to be used in the coldest weather.

IT will be remembered that the Duke of York, when distributing prizes recently on board a training-ship, expressed his deep sympathy with the parents of a boy who, on the very morning when he was to have taken his prize from His Royal Highness, lost his life while cleaning a window. On Wednesday morning the Duke paid a special visit to the exhibit of the National Accident Prevention Window Company, 34, New Bridge-street, London, and, after asking many practical questions, cordially expressed his approval of the window. Mr. W. Youlton, a London architect, who is the inventor, had the honour of explaining the advantages of the window to His Royal Highness. We have already commended the invention, and again urge architects and builders to make themselves acquainted with its advantages, which are many.

ACCORDING to the *Centralblatt der Bauverwaltung*, the new bridge over the Elbe river at Magdeburg, Germany, has a roadway about 26ft. wide, with two street railway tracks in the centre. The pavement consists of pine blocks 4·4in. high, and 3·2in. wide, laid on a bed of 0·8in. of asphalt. Owing to the presence of the railway, the travel over the bridge on each side is entirely in one direction, and the wear on the pavement is very great. After the blocks had been down five years a careful examination of them was made, and it was found that on the rising and level pavement the side of the blocks which the wheels passed over first were not worn at all, but were pressed from 0·5 to 0·6in. into the asphalt. The wear had taken place on the further side. On the falling part of the carriage-way on each side of the bridge the wear had been the opposite. The explanation offered is that the friction of the wheels shoved the blocks in the opposite direction to that of the vehicle, and the traffic was heavy enough to make this shoving of enough force to produce the results noticed.

BLOCK concrete walls are not so recent an introduction as many imagine. Mr. Ranger, a builder, of Brighton, in 1832, took out a patent for an "artificial stone," which was used in several important buildings, among them the College of Surgeons, Lincoln's Inn Fields, and houses in Pall Mall, which have stood remarkably well. He used an aggregate of sea gravel, broken flints, masons' chippings, &c., and he mixed these with powdered grey Dorking lime and boiling water; the latter caused the concrete to set rapidly. This material was put into a mould, and in ten minutes the sides and ends of mould could be taken away; the block was fit for use in a fortnight. The material was rammed into the mould to drive out the air. The mould was a simple box with movable sides and ends, these being held together by four iron cramps. A bar passing through the mould was left while the concretewas being deposited and afterwards withdrawn, and was intended for the convenience of handling and hoisting, for an iron bar could be placed through the hole when required for handling or moving the block.

FLINDERS-STREET market, upon which the city council of Melbourne have spent something like a quarter of a million of money, occupied a good deal of the time of the city council at their last meeting, on a recommendation from the market committee that the contractor be fined £1,000 for delay in completing the contract. The chairman of the committee stated that the contract should have been completed in December, 1892, but it was not finished till August, 1893. This laid the contractor open to penalties of £2,550, but under all the circumstances the architect had recommended to the committee that a penalty of £1,000 be imposed. The town council had lost money by the delay, for at the beginning of 1893 the shops could have been let, but before August the boom had burst, and they had not been let since. He thought a fine of £500 would meet the case. A member of the market committee thought that £250 would be a sufficient fine. After a long discussion it was resolved to refer the question back to the committee for a definite recommendation. A member said the council had no idea it was going to spend £250,000 on the markets when it commenced. A great mistake had been made in not confining the work to a fish market. The chairman of the committee said the income of the markets was meeting the expenditure, which was a good result in these times, and he was quite prepared to take the building on lease and pay the interest of the money expended. An endeavour was made to have an account of £2,274 for professional services by Mr. R. G. Gordon, architect of the building, postponed till the other question was settled; but it was pointed out that the architect had given his final certificate some months since, and the account was passed for payment.

A PERSPECTIVE view is given in *Indian Engineering* of the new public offices now in course of erection at Mehsana for His Highness the Gaekwar of Baroda, from the designs of Mr. F. W. Stevens, C.I.E., F.R.I.B.A., of Bombay. The site of the new building is on the top of a hill overlooking the town of Mehsana, and the structure is designed in the Hindu style, which will harmonise with the buildings of the town. The plan in shape partakes of the letter H. Over the centre grand staircase is a large masonry dome 110ft. high of circular plan, with four similarly shaped cupolas at the angles. Surmounting the angles of corridors of the wings are square-shaped, pointed domes, which emphasise the wings and give variety of outline to the exterior. The ground floor gives accommodation to the departments, judicial, municipal, and engineering, and the upper floor will be occupied by the judicial and Naib Suba's departments. The main façade, which is well broken, is 320ft. long, and the wings are each 100ft. in length; the width is 52ft. The walls are of local bricks, and the dressings, domes, minarets, &c., will be of white Dhrangadra stone. The floors and roofs are to be of iron girders and teak joists, with concrete and asphalte covering.

A deputation of builders waited upon the Cleethorpes Local Board last week, to protest against the action of the building inspector in insisting upon the partition walls of back buildings being carried to the ridge. The board decided that the request of the deputation could not be granted.

A district church was recently opened at Little Walden, Essex. It has been built from designs by Mr. Edward Burgess, of London, and measures 40ft. by 20ft. The walls are of Ashdon red bricks, with dressings of Weldon stone, and the roof is covered with Broseley. The internal roof is of pitch-pine, and the pulpit, reading-desk, and doors are of oak.

Dr. Heinrich Brunn, Professor of Archæology at Munich University, and a member of the Bavarian Privy Council, died at Schliersee on Monday, in his 73rd year.

CHIPS.

Another City church is doomed—that of All Hallows the Great in Upper Thames-street.

A new theatre is about to be erected at Wallsend from plans by Mr. W. Hope, of North Shields.

A new organ, to be built by Messrs. Hele and Co., of Plymouth, is about to be placed in Marylebone Presbyterian Church.

The name of Mr. Frederick Barlow, builder, of Rothwell, has been added to the commissioners of the peace for Northamptonshire.

A Masonic hall is about to be built in Beaconsfield-street, Blyth, Northumberland, from plans by Mr. A. A. Windle, architect, of that town.

New vagrant wards at Crossland Moor, Huddersfield, were opened on Thursday in last week. The wards are on the cell principle, and in two blocks. The cost has been £5,500, and Mr. J. S. Kirk, of Huddersfield, was the architect.

In a breach of promise case, tried at Nottingham on Thursday in last week, before Mr. Justice Wills, in which Samuel Finch Wilkinson, builder and contractor, Newton, was the defendant, the plaintiff, a dressmaker, was awarded £50 damages.

The London County Council's Bill for the construction of a southern approach to the Tower Bridge, was considered on Wednesday by the Committee of the House of Lords, and the clause which relates to betterment was altered in certain particulars.

The small church at Frinton, between Clacton and Walton-on-the-Naze, which was enlarged and restored in 1879, has again been lengthened by an addition of 21ft. to the western end of the nave, giving 100 additional sittings. A new bell-turret has been built.

An organ of three manuals and 35 stops is being built for All Saints' Church, Falmouth, at a cost of £700, as a special gift. The case is of carved oak, and has been designed by Mr. E. Sedding, of Plymouth. The builders are Messrs. Hele and Co., Wyndham-street, Plymouth.

The memorial statue of the late Cardinal Newman will be placed in front of the Oratory at Brompton, objection having been made to its erection at Oxford. The statue, which will be of white Campanella marble, will be placed under a canopy of Portland stone, and is estimated to cost £2,000, towards which about £1,440 is in hand.

The ceremony of opening to the public the new corporation buildings at Dudley, and free libraries at Netherton and Woodside, was performed by the Countess of Dudley, on Tuesday. The buildings have been erected at a total cost of £8,400, the contracts for the edifice at Netherton amounting to about £5,600, and that at Woodside to £2,800. The buildings at Netherton include a public hall (accommodating 1,000 persons), lending library, reading-room, fire station, and three houses for married policemen. At Woodside the buildings comprise a lending library, reading-room, recreation-room, fire station, and two police houses. Mr. T. Grazebrook was the architect, Messrs. Webb and Round were the builders for the Woodside suite of erections, and Mr. D. Willetts (Old Hill) had the contract for the erection of the structures at Netherton. The Earl of Dudley gave at both places sufficient land, worth about £6,000, for the erection of all the buildings.

Two Early English windows in the north transept of Newport Church, North-West Essex, have been filled with Early 14th-century glass. The subjects are SS. Catherine and George. The glass, which was purchased in London, has been rearranged and fixed by Messrs. Heaton, Butler, and Bayne.

Extensive improvements are about to be made to College Green by the Bristol Corporation. The inner railings, which give to the place a pen-like appearance, will be cleared away, so that except as to the boundary railings the whole of the space will be thrown open. The entrance from the bottom of Park-street will be widened, and approached by a slope, instead of steps. None of the trees are to be removed, but some plants and shrubs will be added.

At the half-yearly meeting of the Manchester, Sheffield, and Lincolnshire Railway Co., held on Wednesday, Lord Warncliffe mentioned that the full amount of £4,200,000 required for their extension to London had all been taken up. As they were anxious to lose no time in proceeding with the work, they proposed in a few days to invite tenders from the largest contractors. The company would make it a condition that these tenders must be sent in by the first week in September. This was allowing as short a time to the contractors as possible. The work ought to be executed within the time they originally contemplated—that was, between three and four years, or possibly a little over four years —and the estimates that had been formed of the expenditure were more likely to be within than beyond the mark.

A new Baptist chapel at Codrington, Somerset, was opened on Wednesday week. It is constructed of native blue stone, with Bath stone dressings. Mr. J. B. Hudson, of Yate, was the contractor.

The Hertford and Ware Joint Hospital Board have instructed Messrs. Newman and Newman, of Tooley-street, London Bridge, to prepare plans for the Isolation Hospital to be built at Gallows Hill.

The harbour commissioners of Burntisland, N.B., have instructed Messrs. Thomas Meik and Son, of Edinburgh, the engineers of the present dock, to prepare plans for providing a new deep-water dock at that port. Mr. R. Henderson, the harbour engineer, will be associated with Messrs. Meik in the undertaking.

Mr. J. G. Naish, the well-known painter of Cornish and Devonshire coast landscapes, has placed a full-size cast in bronze from Luca della Robbia's panel called "The Heavenly Choir" in the church at Ilfracombe. The original is now in the Bargello, and represents a group of angels, with psalteries in their hands.

The Duke of York will lay the foundation stone of the new General Post Office for Liverpool on September 10th. The building is being erected from the designs of Mr. Menry Tanner, F.R.I.B.A., of H.M. Office of Works, and was illustrated by plans, perspective and working drawings, in our issues of Oct. 27, Nov. 24, and Dec. 15, 1893.

On Saturday the Mayor of Croydon opened a new municipal lodging-house, which has been erected at Pitlake by the corporation at a cost of about £6,500. The building is divided into two wings, the left being reserved for women and the right for men. It has been built on similar lines to the London County Council establishment in Drury-lane and Lord Rowton's at Vauxhall, the cubicle principle being adopted. The charge made for a bed is to be 5d.

The dedication of the restored west front of Rochester Cathedral took place on Wednesday. This façade, which was built early in the 12th-century by Bishop John, replacing an earlier west front erected by Bishop Gundulf, which had suffered through decay, has been restored on its original lines by Mr. J. L. Pearson, R.A., the contractor being Mr. John Thompson, of Peterborough. The principal features of the restoration, in addition to the repairs, are the raising to their original height of the two flanking turrets, which were lopped off 150 years ago, and the filling of two vacant niches by statues of Bishops Gundulf and John, executed by Mr. N. Hitch. The work just accomplished is part of a larger scheme, which owe its inception to Dean Hole.

FAMBRINI & DANIELS,
MANUFACTURERS OF IMPERISHABLE CONCRETE MASONRY FOR
CORNICES, STRING-COURSES, MODELLED PANELS,
AND EVERY STONE-WORK REQUISITE.

AND ENGINEERING JOURNAL.
VOL. LXVII.—No. 2065.

FRIDAY, AUGUST 3, 1894.

INTERESTING AND UNINTERESTING ART.

IT seems strange but it is quite true, that for a century before the Gothic revival the great aim of architects was to make architecture uninteresting. They got hold of the idea that unless all life, all character, all individuality were carefully squeezed out of it, it could not be "pure." Their efforts succeeded. Like Mrs. General in "Little Dorrit," they produced a "surface"; and, like her, they left nothing below that surface which was worth a moment's examination. It is in this fashion that our art was treated during the time of the Georges, and the fashion reached its climax in the age of "the first gentleman in Europe." Then came the great reaction from Classic to Mediæval. But a change of style, like a change of creed, is not necessarily a change of spirit. The old insipidity remained. The revived Gothic, like the Georgian Classic, was mostly, to use a phrase of Swift's, "deadly dull and dry," and it is only now, when its outward vestments are being thrown aside, that we see many signs of the freshness and naturalness which should have been its highest distinction.

It is with buildings as it is with books: they may have many admirable qualities, and yet not be interesting. Such works remind us of Johnson's cruel remark about "Paradise Lost"—that nobody ever wished it longer. There are some great buildings, as there are some great books, which one studies mainly from a sense of duty. They are "faultily faultless, icily regular, splendidly null." We may learn from them, but we cannot love them. And there are others—full of imperfections, perhaps not half finished, perhaps even incapable from the first of ever being finished—which we never grow tired of. We visit them, and sketch them, and watch them from every point of view, till we end by liking their faults as well as our own. Perhaps it might almost be said that entire perfection is not interesting; the things that have attained are not for us. Human beings with endless possibilities before them are a little out of harmony with all that has found its goal and can go no further. "Things won are done—joy's soul lies in the doing." And so it happens that we turn away, ere long, from all that is quite complete and satisfactory, while we linger fondly over the problems that are only half-solved, and the promises that are only partly fulfilled.

The same building may be interesting in one aspect, and trite enough in others. For instance, it may follow a general type that is tame and commonplace, and yet its details may save it. Roman work, as our great-grandfathers knew it, may be grand; but can hardly be called vitalising or inspiring. It is too regular—too uniform—too mechanical. This, however, is not Roman work as it actually was in the time of the Romans, any more than a fossil skeleton in a museum is the bird or beast in his habit as he lived. It is simply that part of the building in one case, and that part of the animal in the other, which, by its durability, has happened to outlast the other parts. Classic architecture, as it was represented in the books of 50 or 100 years ago, consisted of little else beside columns and entablatures. The proportions varied slightly. In this temple the Corinthian order was so many modules high, while in that temple it was so many modules and a fraction. Our good predecessors of the last century thought that both could not possibly be right, so they held a sort of General Council, and settled, once for all as they supposed, the orthodox width and height, and section of every detail. This was one of the most successful steps they ever took towards making architecture uninteresting; or, as they would have said, towards making it regular and pure. But it would not have suited the Romans. Old Classic art never had the dulness and dryness of modern Classic. Its details redeemed it. There was not only its sculpture, which we partly know, but there was its painting, of which we know very little; there was its wall-decoration, its metal-work, its marble or mosaic floors, its woodwork, its ceilings, its lattices, and its glass. When by good luck we come across any of these, we understand how men of high intellect and imagination found the Classic world a home and not a prison. Its details saved it—the details which, for the most part, perished long before our days; the details which, by their freshness and variety, their freedom and naturalness, would have given a fatal shock to the makers of that abomination of desolation—the Classic revival of the Georgian period.

Arrangement and composition are what give interest to many buildings. In architecture, perhaps, they may be lacking; or, if not, their architecture may be of that cut-and-dried sort which nobody would cross the street to look at. Their designer was not great at details, but he had inspirations of his own about planning and general effect. This was where Wren's strength lay. To some people, perhaps, it is heresy to say so, for when a man's greatness is once admitted, it becomes the popular belief that he was great in every direction. So we have seen persons who ought to know better grovelling in slavish veneration before some of Wren's early productions, which he, probably enough, lived to wish "blotted from the things that be." But people should distinguish. Few designers have ever approached Wren at his best, in his own particular line. Few architects have ever invented so fresh and beautiful a tower as that of Bow, so skilful and novel an interior as that of St. Stephen's, Walbrook. But if we cannot reach the level of Wren at his best, we can all sink to the level of Wren at his worst. Yet even here his planning often saves him from utter inanity. We see that he had an idea to express, even when he could not find time, or would not take trouble, to express it properly. And though the idea may sometimes not be a very good one, as in the ground-plan of St. Antholin, Watling-street, or though it may be only half turned to account, as at St. Swithin's, Cannon-street, yet it is so refreshing to find a man with any internal impulse of his own, that we cannot help watching to see what he makes of it, or what it makes of him.

A work in which two streams of tendency meet is nearly always interesting. It is rarely perfect, or calm, or harmonious, but it is sure to be suggestive. Its very discords are an appeal to us to resolve them; its very mistakes are a question to us as how they could have been avoided. For the architect who wants to be original, transitional periods are the periods to study. The great mistake of the Gothic revival was, that the promoters set themselves to copy Gothic art—not in its nascent state, when it might have branched out into any of a hundred different directions, but in its finished growth and highest development. It is not at its full perfection that anything can be best transplanted. The gardener who wants to move a flower, moves it before its first buds expand—not when its petals lie open to the sun. Put into new soil, with the first stirrings of the spring it sends down fresh roots and throws up fresh stems, and so it takes full possession of its ground. Art has many nascent stages, when two contrary ingredients, like an acid and an alkali, are effervescing before they combine. There was the stage when Classic art first encountered Christianity. We know its productions as "debased Classic," for a "debased" style is the usual prelude of a new style. The vegetation of one year has to decay, that the vegetation of another year may have leaf-mould to grow in—and so it is with art. Then there was the stage when Romanesque architecture, in the time of the Crusaders, met with an influence from the East. We know what happened: it died, and the Gothic styles arose in place of it. But how suggestive the meeting is! How many possibilities seem to have lain in it, beside the one which actually became a fact. Look at the Later Romanesque of Germany; look even at the Transitional Romanesque of England, touched, but not yet destroyed by the grace and lightness of Asia. Note the infinite picturesqueness of Limburg; note the charm of those small western transepts at Peterborough. It was only for a little while that such things were built; the spirit of the 13th century asked for something wilder and more ambitious. But we in the 19th century are perhaps more in sympathy with their unaspiring beauty than with the "star-y-pointing pyramids" of Salisbury or Freiburg.

There are two phases in the architecture of Spain which are full of interest. One is where Gothic and Moorish tendencies met. It was not chiefly in the great churches they did so, though even in some of them traces of Mohammedan art may be found. It is rather in civil and domestic buildings—in carving, in brickwork, and in woodwork that we find them combined. The result, in these secondary features, is often very beautiful, and if our age were capable of profiting by suggestions, might put us on the track of a European style adapted for our works in India. But the subsequent history of Spain shows another and better-known mingling of opposite currents. There, as everywhere else in Europe, this happened in the time of the Early Renaissance. But in Spain, more than elsewhere, and longer than in the rest of Europe, the departing Gothic and the coming Classic did really coalesce. The Renaissance in England gives one the impression that the builders of that period wished to be wholly Italian in their style, but did not at first know how. They were like men learning a foreign language, using its words as far as they could, and filling up with their native dialect the blanks which their ignorance left. In Spain, on the contrary, it might be said that the change for some time only affected minor details. Look, for instance, at the central lantern of Burgos, or the great tower of Salamanca. At a distance they seem almost entirely Gothic. In general feeling and composition they remain characteristically Mediæval. It is only on a nearer view that we find their buttresses are changed into pilasters, their crockets into scrolls or acanthus leaves, and that their lesser features in general are modified in the same direction. We may see a parallel change going on in our own buildings at the present moment. The Gothic revival is meeting the Classic element in modern work, and is both transforming and being transformed by it. Take, for instance, the Imperial Institute. At a first glance, it—and still more, a photograph of it—strikes you as purely Mediæval. It is only on closer examination that you find a change in detail, analogous to that at Salamanca and Burgos.

The best English work of our day will perhaps strike posterity as more interesting than any that has for two or three centuries preceded it. It may be far enough from perfection; it may be anything but rounded, complete, and final. The idea of finality has passed away with the last generation. It fancied it could bring back the 13th century, and fix it for ever. Having caught its style at the climax, it only wished to keep it perpetually. So the men of Gotham tried to keep the spring, but neither spring nor style will stay, and we have learned the fact, as they did. Therefore our architecture at present is full of efforts and experiments, and everything is pardoned to it except tameness. The Romantic tendency, which makes for life and growth, is struggling everywhere with what is miscalled the "Classic" one, which tends to ossification and death. Is architecture still to be full of change and vitality, as it has been in every age and country where it flourished, or is it to be a cut-and-dried system of mechanical rules, as it was in the time —the almost unparalleled time—of the Four Georges? The works in which such a question is being fought out cannot fail to be interesting. May those which succeed them be equally so, and never lapse into the deadly dulness, the modern "Classic" monotony of later Spain.

THE NATIONAL COMPETITION PRIZE DESIGNS.

VISITORS to the National Competition Prize Designs and Drawings at the South Kensington Museum, when they come to the screens on which the prize architectural designs are placed, cannot fail to note two extreme schools of architecture which find favour amongst the students. On one screen they will observe the drawings of a Glasgow student—Mr. Thomas S. Purdie, who receives a silver medal—for an exchange, which might have been designed or erected, as far at least as style is concerned, early in the present century—a design displaying all the refinement of detail and Classical feeling of the best period of revived Greek architecture. It is in the Alexander Thomson's Neo-Grec manner—indeed, the design is for the Thomson Travelling Studentship. On a second screen they will see another Glasgow student's design for a college, which wins the gold medal, thoroughly academical in its plan and general treatment, but in a distinctly Late Gothic style, breathing somewhat the Renaissance spirit in its details, and in parts Seddingesque. It is by Mr. Henry Mitchell. Designs more opposite in style and sentiment it would be difficult to conceive: the one broad and severe in its lines and detail, the other elaborate and picturesque in its masses and features. The design for the exchange is thoroughly Thomsonian; there is a tetrastyle portico of the Ionic order on a platform of steps leading to the grand hall, with flights on either side, and then, through an octagon vestibule to the exchange hall, 115ft. by 70ft., a rectangular-shaped cella surrounded by a peristyle of the Ionic order. Side porticoes to the octagonal hall are recessed. The entrances are narrow. On each side of main staircase hall are the telephone and postal departments, and the other side reading-room, &c. Mr. Henry Mitchell's design for a college we have previously noticed in connection with the Soane Medallion competition of the Institute. There is some skill shown in the plan of each student's set of rooms with its study, bedroom, lobby, pantry, and stairs; these dwellings are disposed round two cloistered quadrangles. There is a well-arranged entrance gateway, with library and chapel projecting at each end, and two lofty flanking towers. The dining-hall is picturesque in its features, and the drawing and detail are masterly. But the chief interest in these designs is that they represent two extreme types of architecture. They may perplex the ordinary visitor; they show, at least, there are two deeply-imbued convictions in the minds of the younger architects, and that we are as far off as ever from one national school. A third Glasgow student, William Tait Conner, takes a silver medal for a design for a royal mausoleum—another design we have seen before at the Institute. A great octagon with heavy-ribbed dome, and coupled disengaged columns at the angles, having an apse on one side, and a massive, rectangular-shaped, two-storied building forming the entrance, and staircases in front—a heavily-outlined and inelegant combination of forms, treated in an Italian style with some boldness. There is a want of gradation in the parts and details, and in the domical composition. We may notice a few other designs.

A bronze medal is awarded to James H. Craigie, Glasgow, for a design for an exchange. A circular portico leads to an entrance and domed hall, with side pedimented entrances. The exchange hall is surrounded by columns of the Ionic order. A like prize is given to Charles D. James, Bradford, for a museum and public library, an elaborate Renaissance design of symmetrical elevation. The two orders in the entrance and the details of end pavilions are not pleasing, and the first-floor windows are meagre. A central tower and cupola rises over the entrance hall. A concert-room occupies the rear block in the axis of building. Another royal mausoleum design is by George Gunn, of Glasgow, submitted for the Tite prize. It has a large octagonal nave, and side apsidal recesses, with chancel and altar sarcophagus, a vestibule, and portico. Lateral colonnades and stairs down to crypt are shown, and the dome is a replica of that of St. Paul's. The design is pretentious and heavy, and takes a bronze medal. Albert H. Hodge, Glasgow, is the author of one or two able designs displaying considerable freshness and originality of conception in the detail and decorative treatment. The country residence for which a bronze medal is given is too broken and unrestful, especially the garden front. Red brick and green tiles are shown. The plan is cut up and irregular in outline. A large hall and staircase forms a principal feature, and the terracotta decoration and fresco, shown by a pencil detail, exhibit a masterly inventiveness and resource, though spoilt by a want of reserve and scale. The latter is conspicuous in the huge figures round hall and staircase. In another design for a market and corn exchange, by Albert Hodge, there is the same freedom and ability in the decoration of friezes. The author, in the exuberance of his invention has perched figures on chimneypieces. The pencil drawings are clever, and would be more intelligible if a less affected style of lettering were adopted. A Nottingham student (A. Bradshaw) sends a fair plan for a public hall with corner tower, having surrounding corridors and side exits. The front, however, lacks breadth. Another student there (J. P. Dixon) obtains a book prize for a design for a market-hall in the Georgian style, with a lofty tower at one corner. There are some good features and details, but the perspective is faulty. The tower is drawn at an acute angle, giving a distorted appearance to the drawing; the circular porch is equally wrong. Amongst other designs we can only notice R. Bedingfield's drawings for a suburban house, the elevations of which are better than the plans; a nice coloured sketch for a gate lodge in brick and tile; also a village school which takes a book prize. The bronze medal study for a church (No. 70) is poor; the pointed aisle windows and the square-headed clerestory windows appear in their wrong positions, and the details are not worthy of the careful drawing. W. C. Gregory's design for a small market-hall is simple and appropriate in plan, and shows artistic feeling, and is awarded a bronze medal. Other designs for a Perpendicular church and a college chapel lack a proper knowledge of Gothic architecture. We also notice a nice sketch for a chimneypiece for town-hall, showing a fairly good feeling for colour, but defective in detail.

The measured drawings are fewer in number this year. The fine marble rood-loft from Bois-le-Duc, which forms one of the entrances to the architectural court of the Museum, has been most faithfully drawn to an inch scale, and coloured by John H. Parkyn, who takes the honorary silver medal of the Training Class. Two other copies take a bronze and book prize. The work is a fine specimen of Flemish Renaissance of 1625. The coloured drawings of the rood-screen of Glasgow Cathedral are clever. Albert H. Hodge, of that city, takes the bronze medal, and evinces a true sense of the beauty of the original. The pierced Decorated tracery and the tombs are drawn with much feeling. Amongst the silver-medal drawings we notice the beautiful pulpit and arcade of Beaulieu Church, New Forest, Hants—a remarkable example of a corbelled stone wall-pulpit and arcade in the Early English style. The drawings and details are by a Birmingham student, James Alfred Swan, who sends also details of Temple Balsall Church, Warwickshire. The drawings of sedilia of All Saints' Church, Hawton, Notts, are awarded the same prize for a finely executed set. Four well-drawn doorways in ink, representing four periods of architecture, from Barfreston Church, Stone Church, Rochester Cathedral, cloister entrance of Canterbury, and other sketches from Kent receive the prize. The author is Harry P. Clifford, of the Training College. A gold medal is awarded to Benjamin J. Fletcher, Leicester, for pencil sketches from several Continental churches, very effective and broad in touch. Other measured drawings of merit include those of Lady Chapel, Lichfield, a fine Decorated example; screen of aisle, Dunster Church, Somersetshire; pencil sketches from Gloucester Cathedral, Lichfield, and Lincoln; south aisle of nave of Chester; Bloxham Church, Oxon, representing the interesting plan of church, all of which take bronze medals. In many of the drawings much labour has been wasted in repetitional features, and in mechanical drawing, that would have been better spent in other details of the same work. As pointed out by the examiners (Professor G. Aitchison, A.R.A., T. G. Jackson, A.R.A., and J. J. Stevenson), some of the measured drawings pretend to give the jointing of masonry, which is obviously incorrect. Other students waste their time in shading by ruled lines which could have been quicker and better done by a wash. As a sensible way of making a measured drawing, the examiners refer to staircase at Leicester by Stephen O. Taylor, which receives a book prize. The coloured drawings of this class are of commonplace interest. Another important remark is made by the examiners—namely, that the conventional way should be discouraged of representing by outlines ornament the effect of which depends entirely on light and shade. On this principle they have awarded the gold medal to B. J. Fletcher, of Leicester, for his pencil sketches of ornament from Bordeaux, Chartres, Troyes, &c.

In the studies of historic styles of ornament, a few meritorious drawings are to be seen. Evelyn G. Thompson, Southport, wins a gold medal for a series of studies in ornament. Many of these represent brocades and other textile fabrics, and this lady student has made an analysis of each kind, showing how the designer is to proceed. The examiners' commend this kind of study, and observe that they would like to see the analytical study more "generally pursued, instead of brainless copying." A silver medal is given to H. C. Wallis, Ryde, I. of Wight, for a very beautifully-drawn representation of a mosaic pavement in the Roman Villa at Bognor, Sussex; a bronze medal to B. J. Fletcher, the recipient of a gold medal for pencil sketches, for some clever studies of tracery and details.

Turning to design, we notice several designs for panels painted in monochrome, for which silver medals are given, as those by Frederick W. Clough, Bradford; Harry Kershaw, Heywood; J. Moore, Birmingham. The second of these is by a boy only 15, displaying much talent for naturalistic ornament, elegant, but rather crowded in the stems. The same prize goes to Jane Twiss, of the Training Class, for a nice frieze panel, with mask and foliage, also for a design for a mosaic pavement, by Geo. J. Carder, of Wordsley, in which peacocks and winged figures are cleverly introduced in border and centre, with wreaths and interlacing bands. The mosaic tile designs are few and inferior. No. 185 is bold in conception, and No. 36 has a silver medal; the design has a good motive, in which birds and strap ornaments are arranged in nice colour. In wall-papers little ability has been shown. No. 54 (silver medal) is bold, in which leafage and fruit have been cleverly adapted for a flat surface—two treatments are shown. No. 28 is well adapted for block printing, and the structure of pattern is good, and colour pleasing. The silver medal also is given to Caroline Thornhill, Blackheath, for a design for wall decoration, No. 22, in which there is a well-designed frieze and filling, the lines of which are agreeably arranged—the motives being fish and sea-plant forms. No. 184 is pleasing also in the structure of pattern. A bold pattern and border is No. 45 for a lace curtain. A handsome design for a hanging is No. 138, in which oak and honeysuckle are adapted.

Internal decoration is poorly represented, and the examiners complain that this section attracts very few students of any talent, and that the designs are commonplace. It is to be regretted that so important a branch of design has received so little attention. Two or three designs, with figures in chalk for stained glass, from Birmingham (Nos. 16, 79, 83) may be mentioned, in which talent is shown in decorative figure design, but hardly sufficient detail is given. In metal-work a gold medal is given to Eleanor L. Mercer, of Sheffield, for some designs for silversmiths' work, including a scent bottle, needle and cigarette cases, chatelaines, bouquet holder, &c. Beauty of outline and delicate detail are shown. The silver vase, No. 638, is extremely elegant in outline. The signs and door-plates in *repoussé* (618), and the boot-scraper (167) are spirited. For wrought-iron gates we see very little of merit; the gate piers in No. 100 are extremely meagre and small for the ironwork. In modelled work we must mention the gold medal design for book cover by Florence D. Steele, South Kensington, to whom the Princess of Wales's Scholarship has been awarded. All the precious parts of the design are protected, and the ornament is appropriate for the material and quiet. The gesso ceiling (64), and the design for frieze (65), silver medal works, are creditable examples. Another gold medal modelled design for a book cover is No. 624, in which the panelled ornament and figures are delicate and refined. Several clever book illustrations are exhibited, of which the menu cards and book plates (No. 192) are conspicuous. The gold medal is won by Robert Spence, Newcastle, for two original designs: one is a battle scene, the other a drawing of "George Fox in Carlisle Gaol," and the silver medal is awarded to Winifred Smith, Birmingham, for a cleverly-drawn series illustrating romances and fairy tales, children's singing games, &c., full of invention and spirited drawing.

THREE PERIODS OF ENGLISH ARCHITECTURE.*

WHAT our English architecture would have come to had not foreign influences checked its growth in the 15th century, is a question that has often been raised. The late Mr. Fergusson and others have speculated on the probabilities of living architecture and what might have happened had modern architects not turned it into a profession. Leopold Eidlitz, in his able work on "The Nature and Functions of Art," has shown the possibilities of the Mediæval styles, and has very justly observed that true and living architecture is a matter of functions, not one of forms. The same line of argument has been taken up by other leading authorities, and we have repeatedly in these pages inculcated the idea that it must be by evolution of pre-existing types, attention to conditions and requirements before mere results of previous ages, that progress can be looked for. Mr. Thomas Harris, F.R.I.B.A., has clearly been seeking a solution of this problem, and his work on "The Three Periods" is chiefly a repertoire of quotations from certain authorities which confirm this principle of growth. No one can dispute the proposition in its abstract terms, although many will differ from the author in his conclusions. The problem attempted is, "What form would the 16th-century Gothic have assumed at the close of the 19th century had its development been uninterrupted?" The discovery of a method is the one thing upon which all will not agree. Mr. Harris divides his work under three distinct periods: "At Work," "Asleep," and "Awaking," which euphemistically distinguish the living and historic art, the period of decadence and the Renaissance, and the Modern Revival. Under the first of these periods, and with the help of a catena of authorities, he refers to the regular steps in the domestic plan, how gradually it was developed from the earliest type, and had adapted itself to the requirements of each period, how the plan preserved its main features till the time of the Renaissance, when foreign influences prevailed over the indigenous Tudor. Several quotations are given from various sources—some of the authors will hardly be taken as authorities on questions of historical development—and plans and illustrations follow to illustrate the growth of domestic plan and design. One objection to these quoted passages is that they are often torn from their context, and can scarcely be said to favour the conclusions of the author, though in this portion of the book there is little to which exception can be taken. Mr. Harris observes that the Italian Renaissance arrested the brick development of the Transition period. Thus, speaking of terracotta, he says "its use died out with the Gothic Renaissance, and from this it would appear that this material was destined to play an important part had the development continued on Gothic lines; but, whatever the reason, the fact remains that the Italian Renaissance found no use for it, and consequently it was discarded." Again, he points out the "plan remained practically unaltered," the other features, doors and windows, roofs and pinnacles, retained their Gothic forms, "but as time went on, the influence of the Renaissance was more and more felt, for a strong German element had been introduced into the country soon after the Italian began to exercise its power. This was Italian work after passing through the alembic of the German mind, and consequently was more Gothic in feeling than the variety imported directly from Italy, or than that coming to us by way of France. The competition between these foreign styles continued until the Gothic element became subservient." Had it not been for the battle of these styles, the author thinks the "ultimate architecture of this transition would probably have gone on other lines," and have in the process of transformation passed through inconceivable developments before supplanting the indigenous style. But this natural evolution was lost in the German and Italian forms, and the three styles became at the close of the 16th century the "bastard" Elizabethan or Jacobean. Several examples are described to illustrate this period, among them Holland House, Kensington; Oxborough Hall, commenced in 1483; East Barsham, Norfolk, 1509 (which is illustrated by us this week); Hampton Court, commenced 1515, finished 1520; Layer Marney Towers, Essex, 1520. At the end of the 16th century Gothic Renaissance became extinct. After it Italian and German influences prevailed, sometimes one more than the other, and the Italian began to lose ground. Wollaton exemplified the former, Bramshill House, Hants, is mentioned to illustrate the latter influence, and a phototint of the last is given. Longleat, Wilts, and other examples are from the Building News.

In the section "Asleep," Mr. Harris is on less satisfactory ground: he has to assign a date to this intermediate period. While we may name an approximate date at which the Gothic architecture gave place to foreign elements, it is rather hard to say how long architecture has been in the dormant condition. The author assumes the third period to have commenced with the Gothic revival, and he credits the pioneers of that movement with the advent of the new architecture. In proof of this, he quotes a passage from Mr. T. G. Jackson's "Modern Gothic Architecture," and refers to his own brochure, published in 1860, on "Victorian Architecture," where Mr. Harris ventured upon the opinion, which practically his present volume is intended to revive, that, if "architecture is to have any meaning at all, a 'new style' is necessary." Many extracts are given from this work, the upshot of which is that we must be prepared to adopt new methods of construction, and new materials like iron, and to accustom ourselves to a new code of proportions. This new style must, he thinks, be founded on the last phase of Gothic, the Tudor, and external polychromy must be one of its chief characteristics. Numerous passages from the writings of Sir G. G. Scott, Viollet-le-Duc, Eidlitz, Professor Kerr, W. Emerson, T. G. Jackson, Jas. Fergusson, &c., are cited, though these differ much in their views of the development of Gothic. In the third and last period, "Awaking," reference is made to metal as the coming material, and its possibilities are sketched. The author alludes to the claims of aluminium as a new metal which is coming to the front, though we are unable to endorse all that can be said of it as a building material. The conclusions arrived at by Mr. Harris are, briefly, that architects are not advancing with or keeping abreast of the times, but are showing a tendency to hark back; that all attempts to invent a new style are abortive—it must grow out of something; that metal seems likely to be the most prominent building material of the future; that in combination with this material various kinds of vitreous manufactures, mosaics, &c., or granite and marble should be employed as panel-filling, and that colour will hold a high position. We agree with the author that metal is a material which demands recognition. It has already been adopted largely in construction; but we cannot believe that it will ever supplant stone, brick, or timber in the architecture of the future, whatever may be its value as a constructive material. A style, or styles, undoubtedly will be evolved in the future; but it or they must be based on a new system of construction, on modern requirements, rather than upon the use of a material which, whatever its value constructively, has fewer aptitudes for building and artistic effect than those in ordinary use. Old architectural forms may, as Leopold Eidlitz says, be dissolved into their elements, but these must be used as separate entities as a basis of new forms. Mr. Harris's book is illustrated by several blocks and plates,

and is worth perusal if only for the labour he has taken to piece together the thoughts of those who have given the subject of architectural development their consideration. The drift of these quotations may be summed up in the advice that the architect must study functions instead of forms. It is premature to say on what particular phase or style of the past the future architecture will be founded.

NOTES ON METHODS OF CONSTRUCTION AT PARIS.

CHIMNEY FLUES AND PIPES.

THE use of earthenware pipes for the building up of chimney flues is now universal at Paris and in the larger French towns. Rarely, except in the case of party-walls or in the case of small houses, are the flues built of brickwork. The pipes are considered to permit much more rapid work, the flues are clean and thoroughly sound, and pargetting is unnecessary. Again, in the case of a flaw it is generally an easy matter to replace the broken portion of piping. The chimney-breast is not employed, and there is, therefore, no necessity for foundations for the latter.

There are a number of different systems of piping, each one claiming perfection and having its partisans. It will, therefore, be interesting to remark a few of those most generally employed at Paris, as shown in Figs. 1, 5, 10, and 11.

All of these are roughly fluted on the two outer surfaces, in order to firmly hold the proper thickness of plastering. The interiors are purposely left rough, to afford a proper hold for the soot, and in the case of the rectangular pipes the corners are slightly rounded.

Some years ago it was the custom generally at Paris, on the construction of a new building, to form the necessary flues in the thickness of the party-wall, the first owner of the wall building at the same time as his own flues a similar number of flues for the use of the building which would eventually be built against the party-wall. This manner of building flues in the thickness of the party-wall was soon, however, forbidden by the building regulations; but after a certain time the prohibition was withdrawn, and it was left to the party-owners to construct the joint wall as they might agree upon. The insurance companies, however, then decided that they would take no responsibilities for houses of which the party-wall was thus built, for it was evident that a wall pierced in a large portion with chimney flues was not sufficient protection against fire, and did not form a sufficient division between two properties.

This being the case, although the construction of flues in party-walls is not forbidden, and is in some cases found necessary, it is now the custom to build the chimney flues against the surface of the wall by means of the hanging pipes shown in Figs. 12, 13, and 14.

The "wagons," or pipes for building into walls, are made of dimensions suitable for walls of the thickness of one brick to two and a half bricks. The walls of the Paris houses are generally built of a thickness to allow a 14in. by 9in. flue; in the case of other walls the hanging pipes are generally employed.

Fig. 1 is a system of pipe made by the Vaugirard Brick Co., and presents many advantages over some of the other systems. The flue is rectangular, with rounded angles, the exterior is provided with projections the size and shape of an ordinary brick. These projections are so arranged as to allow one pipe to fit against the other, as shown in Fig. 2. The joints, as will be seen by Fig. 3, representing the grouping of three inclined flues, are broken horizontally and vertically. These pipes in all systems are made for inclination at various angles; the angle may not, however, be more than 30° from the vertical. The system as shown in Fig. 3 has many merits; the putting together is very simple, the pipes are well bedded together; the joints being well broken, there is little danger of leakage. Again, the rectangular projections allow proper bonding with the brickwork of the wall. In the case that any of the iron joists of the floor require support on the portion of the wall pierced by the chimney-flue, by employing two inclined pipes, Fig. 4, sufficient room is obtained for the passing of the joists, and a firm bedding is obtained on the projecting edge.

Another system (Fig. 5) is the "wagon solidaire Lacote," having a height equal to four bricks. The ends are alternately convex and concave, the pipes are fitted together as shown in Fig. 6, where two flues, one inclined and one vertical, pass up from the floor below, and two others inclined, supported by a bar, take the smoke from the two chimneys on either side of the wall. This system is much employed, but an inconvenience is that of joining the rounded end of the pipe with the square brickwork of the wall.

Another system is that of Fig. 10. The objection that the projecting ties are weak disappears when the pipes are placed together and well jointed.

Fig. 11 shows the system Duprat, of the height of three bricks. The outer walls are hollow, and are supposed to afford greater protection and solidity. In these last two examples the horizontal joints are not broken.

The system of chimney-bricks Lacote is also much employed. This brick (shown in Fig. 7) is of the height of two bricks, the upper vertical projection forming the thickness of a brick. The length of this brick is of the thickness of the wall less one half-brick. When two are fitted together, as in Fig. 8, they form the thickness of the wall, the extremity of each resting on the wall, the remaining portion on the lower one. This special brick forms a secure joint, and has the advantage of making a neat jointing in cases where the wall is left unplastered.

Hanging pipes, or pipes fixed to the wall, are much employed, and are most useful and convenient, either in the case when the available portion of the wall is already filled with flues, or in the case of thin partition walls, or, if necessity is found, to add one or two flues to those already existing. The regulations allow these pipes to be fixed to walls of not less than one brick thick; for the topmost story, however, they may be fixed against partitions of ½in. thickness. The ordinary form known as the "Boisseau Gourlier" is that of Fig. 12, of the height of six bricks, with rough surface for plastering and ribbed end. That of Fig. 13 is known as the "Lacote," and has, on the side towards the inside of the wall three angular projections, called witnesses, intended to oblige the plasterer to cover with the regulation thickness of plaster. This regulation thickness is a little over 3in., including the thickness of the pipe. These pipes are fixed against the wall with plaster, as in Fig. 14, showing three flues from the lower floors, and one to take the smoke from the chimney of that floor.

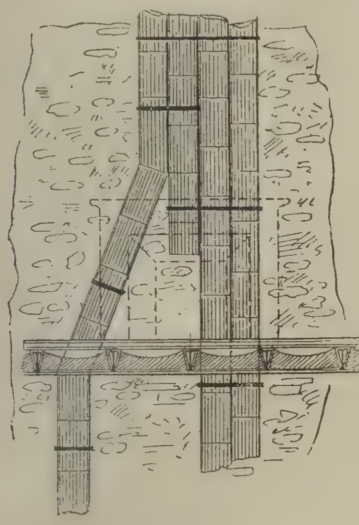

FIG. 14.

The pipes are further firmly fixed to the wall by means of iron straps, placed about every 5ft., and the whole is properly covered with the regulation thickness of plaster. These pipes are most convenient, for they can be inclined in any direction to avoid doors or windows; they are very light, and economise space. Most of these systems are patented in France and abroad, and form a source of large profits to brickmakers. The wall pipes cost from £3 to £4 10s. per hundred, and the hanging pipes from £2 to £3 10s. per hundred, less trade discount. There is, therefore, a great economy in employing them, both as regards cost and labour.

ARTHUR VYE PARMINTER.

PUBLIC HEALTH CONGRESS IN LONDON.

WE continue from our last issue, page 106, and complete, our report of the Congress of the British Institute of Public Health, held during the past week at King's College, London, and which, notwithstanding some misunderstandings and withdrawals at the outset, has passed off very satisfactorily, and has drawn together large audiences.

On Friday there was at noon a general meeting of all sections of the Congress in the large hall, under the presidency of the Bishop of London, when a discussion took place on

THE HOUSING OF THE WORKING CLASSES.

Cardinal Vaughan, in introducing the subject, remarked that there were two main views as to the best way of improving the dwellings of the poor—viz., the block system and the cottage system. Believing as he did that the wellbeing and civilisation of the people depended largely upon their home surroundings, especially in regard to the up-bringing of the children, he could not look upon the proposal to crowd together masses of people under one roof as in any way meeting the difficulty, nor could he believe that the rooms so provided could in any sense take the place of home. The advantages of the block system had reference chiefly to the necessity of living not far from the place of work, and there could be no doubt that for artisans, mechanics, and the lower middle classes these advantages were very great; but for the lowest class of all, and most needy, the most helpless, and often the most vicious, it was an injudicious thing to crowd them together in these blocks. The problem of housing the working classes was in his view to be solved by extension outwards into the country, and by the building of cottage homes, where there would be light and colour and fresh air, and each man's home would be his castle. For the attainment of this object the railway companies might be of great assistance by purchasing land along their lines and building, owning, and managing large cottage towns. In the discussion which followed, Sir Charles Cameron, M.P., argued that artisan dwellings were a mistake, and that what was wanted was a provision of decent accommodation for the very poorest class of all. It was unanimously agreed, on the motion of Cardinal Vaughan, "That while the necessary provision of block dwellings for the housing of the artisan class is being pushed forward within the Metropolis, it is desirable that every effort should be made to increase the number of cottage dwellings in the more accessible suburbs of London and all other large towns, in connection, especially, with the railway system."

Some interesting papers were read on the same day in Section D, Engineering and Architecture, presided over by Professor Banister Fletcher, F.R.I.B.A. In an address on

SEWAGE EFFLUENTS,

Mr. W. Kaye Parry, of Dublin, directed attention to some of the practical aspects of the pollution difficulty, and propounded a series of questions to which he said authoritative answers were demanded. He next referred to the possibility of safely discharging crude sewage into rivers of relatively large volume, and in this connection touched on the Massachussets experiments on the vitality of the typhoid bacillus in river water. He insisted on the necessity for legislation for the protection from pollution of the foreshore of seaside health resorts, and advocated the establishment of standards of purity for effluents. Analytical data were, in the writer's opinion, somewhat illusory, as evidences of the propriety of permitting the effluents which had been analysed to be delivered into rivers and other watercourses.

A LONDON ARCHITECT'S TROUBLES WITH THE LOCAL SANITARY AUTHORITIES.

Mr. Lewis Solomon, F.R.I.B.A., read the following paper:—There are two totally different ways of executing drainage work for an occupant of a London house. One is to do the work in a thoroughly satisfactory manner; and the other to do as little as possible—merely sufficient to comply with the orders of the local sanitary authorities. I assume that an architect has been consulted by a client who requires the sanitary arrangement of his house made thoroughly sound, and that the work is to be done in a complete and economical way, without any special fads, and that the architect has the fullest intention of doing the work thoroughly. The architect's first step, after survey, is to make a plan of the drains, and submit that to the local authorities. Each parish has its own rules for constructing the drainage of houses, and some parishes require the drain plan to one scale, while others require it drawn to a quite different scale. I submit that a uniform scale is desirable, as long as any parish has the power to ask for any particular scale. Some parishes require the position of all closets above the lowest floor to be shown on the drain plan, in addition to those on the lowest floor, while other parishes do not. On the other hand, some parishes require the position of all basement sinks to be indicated, in addition to water-closets and gullies, while others do not require this. A uniform regulation should be issued. Assuming the plans passed by the authorities, the next trouble is the size of the pipes. Most parishes allow 6in. pipes to be used, but I have before now had to take up a new and perfect 6in. pipe drain and replace it by a 9in. pipe, because the sanitary authorities refused to sanction so small a pipe as 6in. If the main house drain passes under the house most parishes insist upon its being 6in. in diameter, whereas if it has to receive only one or two sinks and rain water at the further end 4in. diameter pipes are far better. In some parishes nothing whatever is demanded as to the bedding of pipes in concrete. Some require the pipes to be laid on concrete; some require the concrete to go half-way up the pipes, and others require the pipes to be entirely bedded in concrete. The next trouble is the inspection chamber. Some parishes insist on every house having a chamber at the front, while other parishes require one at the back of the house as well. Some require also a chamber where an entry into the drain occurs in the middle of its length from a soil-pipe. On the other hand, not long ago I had to remove a chamber from such a position, because in that particular parish the sanitary authorities would not sanction internal chambers at all. Some parishes approve of air-inlets at every soil-pipe entry; others will only allow one air inlet. One parish approves of an air-inlet at the front chamber, and a second inlet at the highest point of the drains, whereas in another case two air inlets were objected to, and the authorities insisted on one being removed. Some parishes insist on an outlet ventilator being put at the topmost point of the drains, in addition to outlet ventilation afforded by the continuation of the soil-pipes above the roofs. Some will have the ventilation pipe the same bore as the soil-pipe, whereas in other parishes a 3in. ventilator is considered sufficient for a 4in. soil-pipe. Among recent troubles thrust upon architects by some parishes is the use of certain special water-closet apparatus. Recently I specified that a Sharpe's flush-rim basin should be used for a servants' w.c., and the authorities told my builder that such a w.c. was not allowed in that parish, as they required a special straight-back closet-basin to be used, and would not permit any other. Some parishes allow the drains to be connected to the sewer under the road by the builder doing the drains, other parishes will not give this permission. There is no uniform regulation as to testing drains. Some parishes do not test at all; others test the drains, while others again test the drains and chambers also. A very annoying matter to an architect is the red-tape of some of the vestries, who refuse to acknowledge a letter not addressed to the particular branch of the same department which has to superintend the drains. For instance, lately I applied to the surveyor of a parish to send his sanitary officer to see the drains tested in my presence, and I would make my time suit his. The man came, but refused even to look at the drains, although they were charged, as that was not in his department; he said he belonged to the medical department, instead of the surveyor's, and had been wrongly sent. All I asked him to do was to look, as I was prepared to show him the drains were sound, but as his time was paid for by the parish, he preferred wasting mine to giving himself any trouble whatever. One other matter has come under my notice since writing the above, that while some vestries insist on a sanitary certificate being obtained before the house is occupied, others refuse to grant such a certificate when asked for, although every detail has been carried out under the personal supervision of the local sanitary inspector. It may be said by anyone not accustomed to architect's practice: "If you object to any certain parish requirements, and believe them to be foolish and causing waste of your client's money, why give way, instead of standing on your rights on your client's behalf?" The answer is simple. Under clause 83 of the Metropolitan Local Management Act any person inserting a drain, or water supply, or sanitary apparatus not made according to the directions or regulation of the Vestry, is subject to a fine of £10, and further, if he does not remove such drain or water supply or sanitary apparatus, the vestry have the power to demolish it, and may cause the work they require to be done, and the expenses thereof shall be paid by the parties who have so offended. It will be seen from this that the powers of the vestry are absolute, and although they are generally used fairly, I have known threats to be used where any attempt has been made to argue against the surveyor's dictum For instance, where I had to put a 9in. drain to take two w.c.'s and two rain-water pipes, in place of the 6in. pipe I had inserted, the surveyor threatened to enter the premises and pull up the 6in. pipe, so I was forced to change it with my client's reluctant consent. Again, if any question is disputed, the architect probably has either to give his time and expenses gratis, as the onus of proving his ability is thrown upon him, or else his client has to be mulcted heavily in proportion to the benefit obtained, whereas the expenses of the sanitary authorities are paid by the ratepayers. These powers are more than confirmed by the Public Health London Act, 1891, which says: "If, on examination, any water-closet, sink, or pipe *appears* to be in bad order or to require cleansing, the sanitary authorities, if they think fit, may enter on the premises and execute the works, and the expenses incurred by them in so doing shall be paid to them by the owner or occupier of the premises." There is no doubt that this power is on the whole sensibly used; but it gives a busy-body the opportunity of annoying a perfectly innocent person. Suppose, for instance, after washing up the plates the sink is dirty, the sanitary authorities may cause considerable worry to the owner of the house. Those in good circumstances laugh at this as an absurdity; but in weekly properties the owner is often worried over matters which only *appear* to be out of order, but really are not. I have myself seen a notice served on the landlord because the weekly occupant had removed the cover of a bell trap, and not put it back at once. It might have been advisable to call for the replacement of the bell-trap by a gully, but the notice merely required the reinstatement of the bell-trap cover, which was possibly lying in the sink alongside. The object of these few words is to get some expression of opinion from this meeting that there should be uniform regulations for every parish in London in regard to the main sanitary requirements of the drainage of a house, whilst with regard to the minor requirements, these should be left to the discretion of the house owner or his architect. By main requirements I mean the necessity of every house having its drains of suitable materials, such as earthenware or iron pipes, that the diameter of such pipes should not be less than 4in., that they should be bedded on concrete, that the joints should be of cement if stoneware pipes are used, that there should be inlet and outlet ventilation to the drains, that there should be on intercepting trap to shut off the house drains from the main sewer. Minor matters are the shape and pattern of the various fittings and apparatus, and such matters as only affect the occupier of the house. Some items should be discretionary up to a certain point. For instance, houses under the value of £20 should not be compelled to have inspection chambers; but intercepting traps should be sufficient, as sanctioned in certain parishes, provided they can be cleared without too much trouble and expense. In conclusion, I would suggest to the meeting to consider whether or not it is advisable that a committee be appointed to submit this question to all the London vestries, and get their consent to a uniform set of regulations for the sanitary requirements of a London house.

In the evening the annual dinner of the Institute was held at the Lincoln's Inn Hall, Professor W. R. Smith, the President, in the chair. The Duke of Cambridge was the principal guest.

On Saturday the members of the Congress made an excursion to Hatfield, and in the evening a popular lecture on microbes was delivered by Professor Crookshank, at King's College, before a working men's audience. Having described various forms of bacteria and their destructive powers, he urged as preventive measures pure air, pure water, pure food, and pure surroundings. The address was profusely illustrated by apparatus, cultivations, and lantern slides.

On Monday a general meeting of the Congress was held, under the presidency of Professor W. R. Smith, to discuss

THE PROVISION OF ISOLATION HOSPITALS.

Councillor Dick, chairman of the Glasgow Hospital Committee, who opened the discussion, moved a resolution calling upon the Executive of the Congress to press upon the Government to make the provision of rate-supported hospitals compulsory.—Dr. Sargeant, Medical Officer of Health for Lancashire, seconded the motion.—Dr. Collins, Medical Officer of Health for Kingston-upon-Thames, spoke of the great difficulty experienced by local authorities in obtaining sites for isolation hospitals, and urged that compulsory powers for purchasing land for the purpose should be given to local authorities.—Sir Charles Cameron, of Dublin, said that that city had a perfect craze for erecting hospitals. That was an example that might well be followed by other places, as he was strongly of opinion that infectious cases should not be treated in general hospitals. After further discussion the resolution was carried, with an addition that powers should be given for compulsorily acquiring land.

Mr. Acworth, chairman of the Small-pox Committee of the Metropolitan Asylums Board, moved "That in the opinion of this Congress the Local Government Board is not justified in affording to the owners and occupiers of land in the vicinity of a site proposed to be purchased by a public authority for infection hospital purpose any protection beyond that given them by the action of the general law."—Mr. Scovell, of the Asylums Board, considered that the power of the President of the Local Government Board to make arbitrary decisions as to whether certain sites should or should not be taken should be put an end to.—The motion was carried.

The Lord Provost of Edinburgh (Sir James Russell) presided over the Municipal and Parliamentary Section, at which Mr. Stanley Boulter read a paper on "Municipal-aided Purchase of Artisan Dwellings." Mr. Boulter said it had been objected that there would be considerable loss on such an undertaking, but he quoted figures to show that, while the rent-roll of the Peabody Buildings and of the Industrial Dwellings Company was £24,000 per annum, the annual loss was only £70.

The Earl of Meath read a paper on "Municipalities and Popular Recreation." He hoped soon to see our Metropolitan parks and gardens lighted by electricity; at present some of our public parks, like Hyde Park, were a disgrace to civilisation after dark. He moved "That municipal authorities should be empowered to establish and maintain winter gardens, with wholesome entertainment for the people." Cardinal Vaughan seconded the motion.

In the Engineering and Architectural Section on Monday, Professor Banister Fletcher in the chair, Mr. Campbell Douglas, F.R.I.B.A., of Glasgow, read a paper on

THE PLANNING OF FEVER HOSPITALS.

He laid down some general principles which he considered should be attended to in any well-considered plan for such an institution. As to locality, if provided for a large town where the interests of a school of medicine had to be regarded, the hospital should not be at too great a distance. It should, in any case, be placed in a secluded locality, provided it were not very far remote, and he did not think this distance need be great to prevent risk to the public health. While it was true that that hospital showing the greatest percentage of cures was the cheapest, it did not follow that the most expensive hospital was the most efficient. As to arrangement, the wards should be placed with the long axes lying north-west, and south-east, and he would not lay down any hard-and-fast rule as to the relative distances between wards. Much depended on whether natural displacement or mechanical propulsion were the means adopted for ventilation; but it might be laid down that the air could hardly be pure enough. The lecturer compared the Belvidere Hospital at Glasgow with the old City Fever Hospital in the centre of Edinburgh. The Glasgow institution contains 13 double pavilions of one-story wards, each half containing 15 beds, or 390 in all. Although ventilation is well attended to on the non-propulsion system, and the situation is comparatively rural, the death-rate is higher than in the old-fashioned, almost antiquated city fever hospital at Edinburgh, where the patients are treated in two- and sometimes three-story buildings, the relative rates being less than 6 per cent. deaths in Edinburgh to more than 10 per cent. in Glasgow. Having described the Hamburg Hospital and the Urban and Virchow's hospitals at Berlin, he urged that the great point in planning was to provide plenty of cubic space per bed. About 2,000c.ft. of space should be allowed per bed, and not less than 3,000c.ft. of fresh air delivered per hour. The wards should stand above a thorougly dry and well-ventilated under-story, the whole surface of which should be laid with concrete and asphalte. The walls should be built of hard, dense, non-porous stone or well-burned bricks, and should be solid for 5ft. above the ward floor level. The lower walls might be lined with glazed tiles of ivory yellow or pale green colour, and the upper portions covered with non-absorbent plaster, such as Keen's cement, all being finished flush. The floors might be of good red pine in narrow breadths and waxed, and the ceilings should be kept flat or level. The windows should be double-hung, and reach as near the ceiling as possible; the tables should have metal stands with tops and shelves of glazed earthenware and polished glass, and the bedstead should, of course, be of iron, with hair mattresses. The water-closets should be abundant, and classified, and the heating by open fireplaces, unless the wards were too large to allow this, when hot-water or steam pipes should be employed. In conclusion, Mr. Douglas suggested that hospital accommodation should be provided for every one per thousand of the population in a normal state of health.

ARCHITECTURE AND HYGIENE OF SCHOOLS.

Mr. Thomas J. Bailey, F.R.I.B.A., in a paper on this subject, remarked: The crowding together of large numbers of families on small areas of land has led to the necessity of erecting, in some cases, schools of an exceptional size, and before describing a typical one in detail, it may be well to carry our minds back to the schools built in the earlier days of the school boards, and to observe the growth in this direction, as in others, during the last 21 years, that being just the time since the first school built by the School Board for London was opened. However diversified the arrangements of the buildings of these earlier schools were to suit the sites and surroundings, the buildings themselves were, as a rule, planned with a long central room, and one or two smaller classrooms at each end. The central room, or schoolroom, crowded with children, was a passage to reach the classrooms, and was arranged with desks all along the back wall, the principal windows being in this wall, behind the children, and necessarily full in the eyes of the teachers. These rooms were only 21ft. or 22ft. wide, the desks occupying 12ft. to 13ft. from the back, and the space in front used as a passage and full up with teachers' desks, blackboards and general teaching paraphernalia. The classrooms were, from their position, enabled to be lighted from the side. The staircases were generally narrow, ill-lighted, and, opening almost immediately into the schoolroom, fed it with a supply of cold air in the winter which was sufficient to counteract any warming power supplied in the room. There appears to have been rather a haphazard arrangement for cloaks and lavatories, the accommodation for the purpose having been, generally, very meagre and insufficient, and calling forth many requirements from H.M. inspectors for their improvement. The requirements of the Education Department were then, however, very different from what they are at the present day, as a reference to the Code of only about twelve years ago will show, and it is interesting to notice that the Code at that time, as for many years before, published model plans for schools of varying sizes, which plans, if now sent to them for approval, would receive distinct condemnation. It is sometimes said: If the Department sanctioned these plans, why do they now require alterations in the buildings? But, surely, if the Code for teaching has advanced, greater perfectness in the buildings where such teaching is carried on is also requisite, and it must be remembered that the more advanced Code is applicable everywhere. The weak points of the schools described became apparent in their working, and were found to be:—(1) The want of access to the class-rooms independent of the way through the main room, to avoid disturbance of the classes. (2) The need for dividing up the main room to isolate the classes. (3) The distressing and bad effects of back-lighting. With regard to (1), this led to the construction of corridors outside the main room to reach the end classrooms; but at first these were built narrow, were used as cloak-rooms, and were not warmed. Such corridors, although better than none at all, have long received their condemnation; they were widened from 4ft. to 8ft., then to 12ft., then to 20ft., and then, as will be seen, by a process of evolution, the hall became developed. As soon as the corridors were widened, separate cloak-rooms, independent of these, were built; a system of warming other than open fires was established, and extended to the corridors and cloak-rooms, and thus the discomfort occasioned by the cold draughts from the staircases was obviated, the latter being shut-off by swing doors. As soon as the hall became recognised as a necessary part of a school, when the class-room system was entirely adopted, (2) and (3) became cured, as the main teaching-room I have described ceased to exist, and the school then consisted of the requisite number of independent classrooms, each properly side-lighted, and having its separate access directly into the hall or corridor. The sites themselves need a word of remark, for many of the earlier schools were built on such small plots of land, frequently almost entirely back land, that their light and air suffer seriously. This is not likely to occur in future, as the Education Department now require that there shall be a minimum of 30sq.ft. of open playground for each child, and this requirement insures that the site will be sufficiently open and airy for its purpose, and to secure that the offices are far enough away from the main building as not to constitute a nuisance. This requirement with regard to areas of open playground must be looked upon as a public benefit beyond that accruing to the school itself, as it may be taken generally that the larger the school, the greater density of the population around it, and, consequently, the greater need for these open spaces; and where the playgrounds are properly used for drill, organised games, &c., where children are brought amenable to discipline in recreation as in work, it must be an incalculable benefit, and the playground thus becomes, as Mr. Stow designated it, "the uncovered schoolroom." The comparison between the earlier and present schools would not be complete without a reference to the offices or latrines. As these had to be erected as separate blocks away from the main buildings, and, therefore specially subject to the influence of frost, they were not fitted with single pans, but the only alternative at that time—viz., iron troughs with plug outlets. The buildings in which they were placed were small for their purpose, entirely roofed in, and usually connected by a shed, roof, or covered way with the school. This was found to be so insanitary that the connecting roofs have been removed, as also the roofs over the passages and urinals, and when the automatic flushing tank and stoneware trough (glazed) was invented, a new and more wholesome order of things prevailed. Although, even yet, perfection has not been attained in this direction, experiments are now being made in order to get rid of the trough system altogether, and yet to avoid the inevitable repairs which would be consequent upon such a large number of single apparati. And now for a short description of the Hugh Myddelton School,* which I have taken as a modern type, a large, important school in the centre of London, opened by H.R.H. the Prince of Wales in December last, and named to perpetuate the founder of the New River Co., in his own district. As is well known, the school stands upon an historic site, taking the place of the old House of Detention in Clerkenwell. The area of the site is 95,832sq.ft., or upwards of two acres of land, and, being surrounded by streets, is well off for light and air and playgrounds in such a crowded district. The school is built for 2,000 children in three departments. There are also on the site a separate school of twelve classrooms—six on each side of a corridor, 20ft. wide, for the instruction of the deaf. Also a centre for cookery instruction, and a centre for laundry work. The main school is three stories high, the infants' being on the ground floor, and consists in each department of a central hall 80ft. by 40ft., lighted at each end by large windows. On each side of the hall are classrooms—10 in all—with an average seating accommodation of 60 each in the boys' and girls' departments. It may be here remarked, that the method of calculating the accommodation in the infants' department is 8 superficial feet for each child, and therefore, on the lower floor of a three-story school, each classroom seated for 60 in the graded departments is reckoned to give infants' accommodation for 75 to 80. There are four spacious staircases, well lighted, giving access to the upper floors; and in proximity to these are ample cloakroom and lavatory accommodation, and also large rooms for the use of the staff of teachers in each department. The halls and classrooms on the two lower floors are 15ft. clear height, and on the upper floor are more as they run into the roof. The system of warming adopted is low-pressure steam, with ventilating radiators; and the hall, being amply warmed, and being a large area, not seated for teaching, and therefore unoccupied while the classrooms are in use, provides a plentiful supply in winter of warmed uncontaminated air to the classrooms. Means are also provided in these for inlet of fresh air directly from the outside, both by shafts in the corners of the rooms, where stagnant air is apt to accumulate, as also by the ventilating radiators and sills of the windows. Extracts for foul air are provided in brick shafts at the ceiling level, an open fire is provided in the babies' room, both for the required cheerfulness and the promotion of the greater ventilation required here. These means have proved amply sufficient in their results. I have been in and out of this school many times during the last winter, and I am sure the teachers will bear me out in agreeing that there is an entire absence of what is known as the "school smell," with which, I am afraid, we are all familiar in the schools of twenty years ago. The cloak-rooms are warmed by rows of steam pipes, and ventilated by a current of air from end to end. The boys occupy the top floor, and at the two ends of the building, over the further classrooms, are a drawing-class room and a manual training-room respectively. I am afraid this latter is a source of disturbance to the classroom beneath it, and as the Board have now decided that this shall be one of the selected schools where higher standards are taught, a chemical laboratory or science room will be required in this position, and a manual training workshop can be erected in the boys' playground, for which there is ample room. The playgrounds, like all those under the Board, are laid to gentle falls, properly drained, and the surface covered with tar-paving, so that it is always available, part being covered in for use in wet or bad weather. This description of the Hugh Myddelton school applies generally to all the schools now being erected by the School Board, except where the sites are sufficiently large to allow of one-story buildings, in which cases the classrooms for boys and girls are grouped round a central hall common to both, and can be worked either as mixed or separate schools. The infants' department in these cases is usually in a separate building. This system of building is obtaining more in the suburbs of London, where land is comparatively cheap, and, in such cases, sites of about two acres are being secured, experience having shown that, where a school is built for, say, 800, on a proportionate site—*i.e.*, one quarter of an acre for every 250 children, as required by the Code, the development of the neighbourhood has necessitated an enlargement of the school, and more land has had to be subsequently acquired for the purpose at an enhanced cost. It is not much to be surprised at, considering what schools were when school boards began their work, that so much development has taken place in so short a time, and, the contrast between earlier schools and the more modern ones being so marked, should lead to considerable expense in alterations and improvements in the former, especially considering that the same teaching results are not only expected, but actually required from ill-adapted, and in many cases, overcrowded, draughty, and unventilated buildings, as from the new roomy, healthy schools which, I venture to think, fulfil all requirements of the present day. And if any further evolution takes place, it is only likely to be in the direction of an alteration in the 60 unit for classrooms. Although, even if this is reduced, there will be an advantage in a little more elbow-room, and an increase in the cubical air supply per scholar in classrooms of the present size, calculated for a smaller number of children. And, remembering that, 15 years ago, a classroom as now calculated for 60 with a cubical space of 150ft. per scholar was allowed for 70 with a cubical space of 128ft., this would be a further step in the right direction.

The members of the section afterwards visited the subways of the Holborn Viaduct and the City Destructor at Letts's Wharf, under the direction of Mr. F. G. Burmaster.

In the evening the Master and Wardens of the Carpenters' Company entertained the chief members of the Congress at dinner in their hall.

The closing meeting of the Congress was held on Tuesday at King's College, Professor W. R. Smith in the chair. The report presented by Professor Banister Fletcher, of the Engineering and Building Construction Section, was referred to the Council of the Institute for further consideration. The report stated that the present want of uniformity in the regulations and by-laws of local anthorities in relation to sanitary construction and appliances was detrimental to sanitary progress and injurious to the health of the people, and should, therefore, be amended; and that it was desirable that the Local Government Board should frame a model set of rules and regulations. Every sanitary inspector should have a practical knowledge of building construction, as he could not fulfil his duty unless he had the trade technical knowledge. The Section deeply regretted the want of uniformity in the decisions given by judges and magistrates, and believed that the only remedy was the appointment by Government of a special tribunal which should deal with all questions of building construction and sanitary appliances. Whilst fully recognising the wise application by the Corporation of the City of London of the funds in their hands in the building of the Tower Bridge, the Congress could not but express its hope that municipal baths should now engage their attention, and thus remove this stigma from that great City.

In the evening a dinner was given to leading members of the Congress by the Sanitary Committee of the City Commissioners of Sewers, Professor Banister Fletcher in the chair; and a conversazione was held by the Corporation at the Guildhall, and was attended by over two thousand guests.

BUILDERS' BENEVOLENT INSTITUTION.

ANNUAL MEETING.

THE 47th annual meeting of this institution took place on Thursday, 26th July, at the offices, 35, Southampton-row, Bloomsbury. Mr. George Plucknett, J.P. (hon. treasurer), occupied the chair, supported by Messrs. Thomas Stirling, C. Bussell, Robert Perkins, and other friends of the charity.

Major Brutton (the secretary) read the annual report, which states that the committee consider the institution is prospering; but they do not withhold the fact that it needs increased income, so as to provide for all those who, from unavoidable causes, are of necessity obliged to seek its benefits. Thus for want of sufficient income the committee are unable to recommend for election all who apply and are eligible; this being the more to be regretted, as most of them are of an age which pleads for immediate relief. There are doubtless many builders in the metropolis and its environs who are in easy circumstances, but who have never contributed to the finds of the charity; nevertheless the committee hope such persons may be induced to subscribe, as contributions from them would secure provision for all fit applicants. There are now fifteen men and thirty-three women depending upon the institution. The preponderance in the number of females is in consequence of the widows of pensioners having been made pensioners on the decease of their husbands, in accordance with the rules. During the past year five male and two female pensioners had died; one male and three female pensioners had been elected. The late Mr. Thomas Robinson, formerly a partner in the firm of Messrs. William Cubitt and Co., has bequeathed £1,000 to the institution, which according to the rules affecting legacies, will be invested in Consols, and added to the other funded property belonging to the charity. The committee also express their thanks to Mr. George Haward Trollope for the successful exertion he made in his presidential year to obtain a substantial sum for the institution, this object having been accomplished by Mr. Trollope's influence and liberality. The committee had the gratification to intimate that Mr. Basil Pym Ellis, of the firm of Messrs. Lucas and Aird, had consented to be the president for the ensuing year, and that he would preside at the annual dinner to be held on the 15th of November next, in the hall of the Worshipful Company of Carpenters, London-wall.

Mr. Thomas Stirling moved the adoption of the report and balance-sheet. Mr. Robert Perkins seconded the motion, which was agreed to unanimously.

The thanks of the meeting were given to Mr. G. H. Trollope for his support and services during the past year, and votes of thanks were also passed to the vice-presidents and trustees, and to Mr. Plucknett for his valuable services, he being again re-elected treasurer.

A vote of thanks was passed to the committee, and the retiring members re-elected, with the addition of Mr. Trollope. Thanks were also voted to the auditors, who were reappointed.

On the motion of Mr. Stirling, Mr. Basil Pym Ellis was appointed president for the ensuing year, and a vote of thanks to the chairman closed the proceedings.

NATIONAL ASSOCIATION OF MASTER BUILDERS.

THE half-yearly meeting of the National Association of Master Builders of Great Britain was held last week at Bolton. The president of the association (Mr. John Bowen, Birmingham) occupied the chair, and 75 delegates were present representing the principal cities and towns of the kingdom. The report and treasurer's statement presented to the meeting by the secretary (Mr. J. A. S. Hassall, Liverpool) and treasurer (Mr. C. W. Green, Liverpool) showed the association to be in a flourishing condition. A report of a special sub-committee dealing with a suggested formation of a central fund, by means of a levy upon each member, was discussed. The report was received and its consideration left over until the next half-yearly meeting. The present position of the "Temperton v. Russell" case was explained, and further sums were promised by members, and a sum voted by the association towards the costs of the case. On the proposition of Ald. Jessop, of Huddersfield, the following resolution was passed:—"That the National Association of Master Builders of Great Britain use their best efforts to get the obnoxious rule relating to worked stone being imported into all towns in Great Britain expunged if the stone is prepared at standard rate of wages." This rule was considered most objectionable and unreasonable. The meeting expressed itself determined to contest the insertion or continuance of such a rule as named. Correspondence with Her Majesty's Office of Works and other general business was transacted, and the meeting terminated after three hours' deliberations. After the termination of the meeting, the Bolton Association entertained the delegates to dinner at the Commercial Hotel. Subsequently the company returned to the Mayor's Dining Room, in the Town Hall, where a social evening was spent. The chair was occupied by the local president (Mr. Wm. Lee) and the vice-chair by Mr. Bradbury (vice-president). Mr. Marsden (treasurer) supported the chair. The Mayor of Bolton, Alderman Nicholson, attended and received a hearty welcome, and responded in a practical speech. The toast of the National Association was proposed by Mr. Marsden, and responded to by the president of that body. "The Bolton Master Builders' Association" was proposed by Mr. Walker (Derby), and responded to by Mr. Townson. "The Mayor and Corporation of Bolton and local governing bodies" was given by Mr. Ratcliffe. The "Building and General Trade of Bolton" was proposed by Mr. Cuerden, and responded to by Mr. A. Atherton. Mr. Maginnis proposed "The Architects," which was responded to by Mr. Robert Neill. "The President and Officers of the Bolton Master Builders' Association" was given by Mr. Humphreys (president of the Bristol Association), and was responded to by Messrs. Lee and Bradbury, president and vice-president.

THE THRUSTS ON WALLS AND ARCHES.*—VI.

By G. A. T. Middleton.

RESISTANCE TO SLIDING.

FAILURE by sliding, though not very common, is yet possible, and of occasional occurrence, and so must be provided against. Of course, were all substances perfectly smooth, and so perfectly frictionless, sliding would inevitably take place, and the more nearly two adjacent surfaces approximate to perfect smoothness, the greater is the possibility of their sliding upon one another.

Fig. 19.

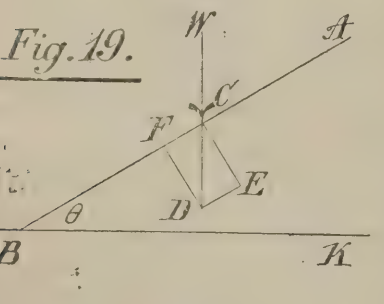

Fig. 20.

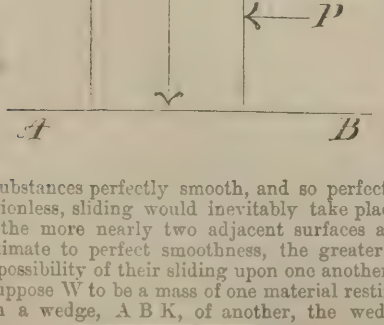

Suppose W to be a mass of one material resting upon a wedge, A B K, of another, the wedge being such that sliding is just upon the point of taking place, the angle A B K or θ being the angle of repose between the two substances. The weight of the mass W can be represented to scale by the vertical line C D, and under these circumstances it is being held in position by the normal resistance of the wedge A B K, as represented by the line C E at right angles to A B, and by the friction, as represented by the line C F along A B—the lengths of these lines being determined by forming a parallelogram of forces round C D, resolving it into forces, C E and C F, normal and parallel respectively to A B.

F C is the value of the friction between the two substances under consideration, which has to be overcome before sliding can take place. Under the present circumstances, it is just met and equated by the component of W which acts along A B, and its value is constant for these two substances, being equal to the normal component C E, multiplied by the tangent of the angle of repose (tan. θ).

This is readily proved, for the angle D C E is equal to the angle θ, and D E = F C.

Therefore—

$$\begin{aligned} \frac{DE}{CE} &= \tan. DCE \\ &= \tan. \theta \\ \therefore DE &= CE \tan. \theta \\ \therefore FC &= CE \tan. \theta \end{aligned}$$

Tan. θ is known as the *coefficient of friction*, and is a constant multiplier for any two materials the angle of repose between which is known.

Thus, if W be the weight of a block of one material resting upon a horizontal surface, A B, of another, the coefficient of friction between the two materials being known, and the normal component of the weight being in this case equal to the weight itself, then the friction is represented by—

W × coefficient of friction.

and the pressure P, parallel with the surface A B, which is necessary to overcome this friction and cause sliding, must consequently be greater than W × coefficient of friction.

The following table gives the generally accepted angles of repose and their tangents (or the coefficients of friction):—

	Angle of repose.	Coefficient of friction.
Masonry and brickwork, dry	31° to 35°	·6 to ·7
Ditto with wet mortar	25½°	·47
Ditto with slightly damp mortar	36½°	·74
Ditto on dry clay	27°	·51
Ditto on moist clay	18¼°	·33
Wood on stone	22°	·4
Metals on stone	35° to 16⅔°	·7 to ·3
Wood on wood, dry	14° to 26½°	·25 to ·5
Metals on metals, dry	8½° to 11½°	·15 to ·2
Smoothest and best greased surfaces	1¾° to 2°	·03 to ·036

OBITUARY.

Mr. Lawrence Booth, F.R.I.B.A., of Oxford Arcade, Manchester, died at his residence, Crumpsall Green, Crumpsall, on Wednesday night, in his 58th year. For a long time Mr. Booth had been in failing health from consumption, which was the main cause of death. A native of Bury, Lancashire, he served his time with Mr. Joseph Stott, architect, of Oldham, and afterwards commenced practice at Union Churches, Bury. Some years later Mr. Booth removed to Manchester, and became senior partner in the firm of Blackwell and Booth, and on the death of Mr. Blackwell he took over the business, and took as partner his chief clerk, Mr. Thomas Chadwick. Mr. Booth's works include the Bury Infirmary, Hope Hospital (Salford Union), the largest building he was ever engaged upon; enlargements in connection with the Royal Infirmary, Manchester, and Barnes's Convalescent Home, Cheadle. We may also mention the Jesse Haworth Memorial Church at Walshaw, consecrated February 17th, 1892; St. Thomas's Church (1867) and Schools, Bury; St. Andrew's (Dundee) Presbyterian Church, Ramsbottom; the Lancashire and Yorkshire Bank, Silver-street, Bury; the Prince's Club, Manchester-road; the Union Club, also at Bury; the restoration of Bury Parish Church; part of the Bury Union Workhouse; Helen's Holme, Chesham; The Brooklands, and a house near Whitefield. Mr. Booth designed the headquarters of what was then the 2nd Manchester Volunteer Battalion at Ardwick (opened by the Duke of Cambridge); St. Mary's large schools and the vicarage, Rawtenstall, and the restoration of the church; he had some connection with the erection of the Winter Garden, Southport; designed and erected the Newton Heath public baths, hall, and free library; Salford Baths, Middleton Free Library, and a large number of warehouses and other buildings in the city of Manchester. As an arbitrator in property disputes, Mr. Booth was very frequently engaged. He joined the Royal Institute of British Architects as an Associate, in 1864, and six years later became a Fellow. The firm of Booth and Chadwick last year obtained the first prize of £300 offered by the Stockport Union authorities for the best design for a new workhouse. Along with a number of other gentlemen, Mr. Booth joined in the purchasing of the Colwyn and Pwlly Crochon Estate, Colwyn Bay, and the floating of it as a company under that title. Many of the buildings on that estate were designed by Mr. Booth's firm.

CHIPS.

Mr. C. E. Mallows, whose pen-and-ink work is well known, has been for fully a year past laid aside by very severe illness, and now that he is slowly recovering, some of his friends propose to present him with a token of their esteem and sympathy. For this purpose Messrs T. E. Collcutt, Aston Webb, and Leonard Stokes are willing to receive subscriptions up to the 7th of August. It has been decided that the presentation shall consist of a purse of sovereigns.

Alvaston parish church, Derbyshire, has just been enriched by the addition of a large chiming clock and peal of bells, the whole being the gift of Mr. W. Bradshaw. The clock is fitted with all the latest improvements, and was made by John Smith and Sons, Midland Clock Works, Derby.

The St. John's School, Bristol, is being warmed and ventilated by means of Shorland's patent Manchester grates, the same being supplied by Messrs. E. H. Shorland and Brother, of Manchester.

It is proposed to restore the parish church of St. Michael at Michaelstown-y-Vedw, near Cardiff, at an estimated cost of £1,000. Messrs. Seddon and Coates Carter, of London and Cardiff, are the architects.

On Saturday memorial stones were laid of a Baptist chapel which is being erected in Arthur-Road, Saltley, Birmingham. The chapel will cost about £2,500. It will be of red brick, with stone facings, in a Gothic style; the dimensions will be 75ft. by 35ft., and will give accommodation for about 500 persons. In the rear of the chapel there will be three vestries, one 17ft. by 13ft., the other two 13ft. by 10ft. The school will be 70ft. by 39ft., with infants' room at the rear with separate entrance, the whole school to accommodate 500 children.

The Carnarvon Corporation met on Monday night for the election of a borough surveyor, in succession to Mr. Wynn Roberts, who has accepted a similar appointment at Oswestry. The candidates were Mr. Davies, surveyor to the Newton Local Board, in whose favour the selection committee were unanimous out of 40 candidates, and Councillor R. Lloyd-Jones, who for some years held the office, and in favour of whom 459 ratepayers petitioned. Alderman B. Williams protested against an attempt to ignore the action of the committee who had not even named Mr. Lloyd-Jones. On a division Mr. Lloyd-Jones was temporarily elected by ten votes to nine, the mayor not voting. A vacancy on the council is thus caused.

Messrs. Debenham, Tewson, and Farmer offered for sale, at the Mart, Tokenhouse-yard, on Tuesday, the fabric and site of the church of All Hallows the Great, Upper Thames-street. The principal features of interest and various adornments have been removed to the church of St. Michael Royal, on College-hill, with which parish All Hallows is in future to be united, and the old oak panelling and pewing were withdrawn from the sale. The site of the church covers an area of 4,130sq.ft., with a frontage of 87½ft. to Thames-street, and a depth of 48ft. Part of the proceeds of the sale are to be devoted to the erection of a church in a densely-populated part of St. Pancras. The property was knocked down for £13,100, or a little over £3 per foot, to Alderman Sir Francis Truscott.

Alterations are being made to South Mims church, Barnet, from the designs of Mr. J. C. Traylen, architect, Stamford. The ventilation of same will now be effected on the Boyle system, consisting of the latest patented improved form of the self-acting air-pump ventilators, for the extraction of the vitiated air, and improved air inlets for the admission of fresh air.

AUTOGRAPH DRAWINGS BY THE LATE JOSEPH NASH.

We are indebted to Mr. Wyatt Papworth for the loan of this interesting group of original sepia sketches by the late Joseph Nash, which form part of a small set of studies now belonging to the executors of the late Mr. Alfred Morant, C.E., and who kindly consented to this selection which we have made for our representative series of reproductions of drawings by this famous master of the pictorial rendering of architectural subjects. All the specimens included in the accompanying pictures are examples of brick building, three being from Norfolk and one from Surrey. This last shows the historic Palace Hall at Croydon as it appeared in 1830, after the fire which partly demolished the place that year. The hall is, of course, chiefly remarkable for its fine roof, which Nash's sketch clearly displays, showing the open framing up to the ridge, very similar in construction and design to the celebrated roof over the hall of Christ Church, Oxford. It dates from the reign of Henry VII. or VIII., and has good arched principals, with pendants and angel corbels. The hall was long used as a bleaching-house in connection with a laundry. The windows, like those of the Archbishop's Palace Chapel, are of a debased form of Perpendicular Gothic, and the walls of brick have stone dressings. Details of the building figure in Pugin's "Examples." The screen and stalls in the chapel are of James I. date. Thorpland Hall, of the Tudors, was erected when Henry VII. was king. Its builders were the Fermors, and it stands about three miles from East Barsham, in Norfolk. The walls, partly of flint, have brick and moulded terracotta dressings, with ashlar copings and window framings in stone. The chimney-shafts are good brick ones, and the house, though small, has characteristic gables. Wolterton Manor House, as East Barsham Hall is sometimes called, supplies the two subjects of the remaining studies. Plans and geometrical elevations of this extremely interesting mansion were published in the Building News for Nov. 1st, 1889. Sir William Fermor erected the house about the same time as Thorpland Hall; but it is a much finer and richer example of Domestic architecture, of course, and ranks as one of the most notable examples of the use of elaborated terracotta in England of its date and style. The griffin and greyhound over the gateway support the arms of France and England, and are unsurpassed for freedom of treatment and boldness of design. The chimneys also are exceptionally beautiful. The buildings have long been partly ruined, and are used as a farmhouse. These drawings by Nash were exhibited at the Burlington Fine Arts Club, in Savile-row, in 1884.

R.I.B.A. SOANE MEDALLION PRIZE DRAWINGS: DESIGN FOR A COLLEGE.

We now complete the series of illustrations which we made from the prize set of designs by Mr. Jas. H. Tonge, who won £100 and the Soane Medallion with them last winter. Our other plates, giving views, details, and plans, will be found in our pages for May 25th and June 15th this year.

"PASSMORE EDWARDS" FREE LIBRARY, REDRUTH.

This building is the gift of Mr. J. Passmore Edwards, who was born within three miles of Redruth. In addition to the accommodation shown on the plans, there is a basement floor containing heating chamber, stores, and living-rooms for a caretaker. The external walls are of granite raised from quarries on the carn close by. All the dressings are also of granite, finely dressed. The fittings internally are of pitch-pine. The work has been intrusted to Mr. John Symons, of Blackwater, an old schoolmate of Mr. Passmore Edwards.

TRAINING COLLEGE FOR WOMEN.

The Cambridge Training College for women was incorporated on January 26th, 1893. Its object is to give a professional training to educated women who intend to teach. In addition to the course of training, it offers the advantages of a college life, and one year's residence in Cambridge. The students are allowed to attend university lectures on teaching, and have ample opportunity for teaching in various schools in Cambridge. The building provides accommodation for about 50 students, most of them having separate rooms, and a few larger rooms are provided where two friends may be together. The lecture-room, library, &c., are on the ground floor, and the dining-hall, kitchen, and offices connected with it are on the first floor. The building is carried out in red brick, and the ornamental portions in terracotta. The roof is covered with red tiles. The college was commenced about ten years ago, in small premises, and has since grown steadily in numbers and importance, under the able management of Miss E. P. Hughes, the lady principal. A bequest from the Pfeiffer trustees of £3,000, with assistance from other friends of the college, has enabled the governing body to commence the present building.

NO. IX. CAVENDISH-SQUARE.

The building at the corner of Cavendish-square and Chandos-street, which we illustrate this week, is a block of flats on a somewhat more elaborate scale than those in most other situations. Several of the flats, in addition to the three usual reception-rooms and a large smoking lounge-hall, have eight or nine bedrooms, a kitchen, a scullery, and all the usual domestic accommodation. Every flat has its own bath, hot water, and double set of closets. The suites are approached from Cavendish-square by a semicircular stone staircase with very broad landings, and the passenger lift and service lift go to every floor of the building. The floors are fireproof, and boarded over the fireproofing. Both the fronts to Cavendish-square and Chandos-street are of Portland stone and Ibstock red brick, and the porch is entirely of Portland stone, in keeping with the other mansions on the north side of Cavendish-square. The building has been erected by Mr. Thos. Boyce, of Hart-street, Bloomsbury, at a cost of considerably over £30,000, from the designs of the joint architects, Mr. Lewis Solomon, F.R.I.B.A., and Mr. E. Carrington Arnold, of 55, New Broad-street, E.C.

BIRMINGHAM ARCHITECTURAL ASSOCIATION.

An experimental sketching excursion has been made by this association, and with such satisfactory results that it is hoped it will become an annual affair. Evesham was the first place visited, where the members met on Friday afternoon, July 13, driving in the evening to Broadway, which was made the head-quarters until the following Tuesday, when the members dispersed, taking various routes back to Birmingham. On Saturday morning a drive of some five miles through a beautifully wooded country at the foot of the Cotswold Hills brought the party to Stanway House, the seat of Lord Elcho, who kindly gave access to the house, and hospitably entertained the visitors. This house is remarkable for its west front and forecourt, containing the gateway said to be designed by Inigo Jones, also the gateways leading into the churchyard and stables, views of which may be seen in Mr. Gotch's book, which show the fine bay window to the hall. There is a tithe barn in the grounds, formerly attached to the abbey of Tewkesbury, and now used as a tennis court. A move was made at 1.30 for Sudeley Castle, a larger house forming three sides of a quadrangle, for many years in a ruinous condition; but restorations have been made from time to time, until now the whole is practically inhabited, except the banqueting hall, which reminds one of that at Kenilworth. The house is well worth seeing, and contains a perfect museum of valuable pictures, furniture, and curiosities of great historical interest. Winchcomb, an old-fashioned market town, situated just outside the park, has a fine Perpendicular church, containing a good sedilia, and Renaissance organ case and candelabra, and the town possesses many picturesque bits. Broadway occupied the whole of Sunday morning, when a good number of sketches were made of the numberless groups of cottages lining the straggling village street. The old church, now used as a cemetery chapel, is of various dates, and has a Late central tower with a quaint square turret springing from the east wall of the north transept. The absence of buttresses is a notable feature, giving breadth to the wall surfaces of the small church. After luncheon a walk along the hills brought Buckland in sight, a village having a small church, with manor house adjoining. The rectory is also a stone house, and contains a 14th-century hall, with hammerbeam roof truss and half-timber gallery front, which is shown with much readiness by the rector, who does not object to sketching on Sunday. The next village, Stanton, contains an unrestored church of great interest, and the stone cottages are some of the finest in Worcestershire. Monday morning was inclined to be wet, which prevented very much being done at Weston Subedge, the first stopping-place. Here are more stone cottages of great variety and character, and well worth careful study. Aston Subedge, about two miles off, has an L-planned manor house, containing a good staircase leading up to rooms now used as a granary. Chipping Campden was the principal feature of Monday's programme, being noted for its long wide street with market house, town hall, and houses built at intervals up the centre. Many of the inns have their old signs still swinging on their fronts, making a picturesque and fretted skyline. Not a few of the houses are of great interest, especially the wool-staplers—now used as a priest's house—and the almshouses, making a fine group with the church and ruins of Campden House. The latter has been freely illustrated in the A.A. Sketch Book. A drive of some six miles back to Broadway over the hills, in order to see the remarkable views, brought the day to a close. Several members were compelled to return direct to Birmingham on Tuesday morning; the remainder, driving with them as far as Evesham, started for Moreton-in-Marsh to see the Redesdale Memorial Hall and Batsford Park, lately built at the cost of Mr. A. B. Freeman-Mitford, M.P., from designs by Messrs. Ernest George and Peto, and illustrated in the Building News of May 13, 1887, and Jan. 4, 1889. Both are certainly very remarkable works, and particularly interesting to carefully examine after a course of stone mullioned old work, upon which the designs are based and executed in the materials of the locality. The stables of the house are unfortunately not by the same architects. The afternoon was spent in rambling through Chastleton House, a drawing of which, by Mr. E. Guy Dawber, appeared in the Building News for May 12, 1893, and also illustrated in Mr. Gotch's book. The house is only occupied at the present time by a caretaker, but contains the old furniture, china, and tapestries, in this respect resembling Haddon Hall, and affording subjects for measuring and sketching for several days in itself.

Charles E. Bateman.

BLACKBURN FEVER HOSPITAL.

WAYSIDE NOTES.

I THOUGHT so! The meeting of the Commissioners of the Exhibiton of 1851 was held last Friday at Marlborough House. The Prince of Wales presided, and there were twenty commissioners present, including Prince Christian, the Duke of Cambridge, and the Duke of Fife. It is nearly two years since the last meeting was held, and the report read, which chiefly related to financial questions connected with the Gore House estate, was a long one. Among the matters discussed was the position of Alexandra House for the reception of female students attending science classes in South Kensington, and it was resolved to form an association of trustees to be intrusted with its administration. It was further decided to contribute £200 a year for five years in aid of the maintenance of the department for investigating and testing the natural products of the colonies and India at the Imperial Institute, in addition to the payment of £300 for the same purpose. That means another £1,300, from funds which are really national, towards the abortive Institute which does little but dine and wine its members and tea the loungers at sixpence a head!

I do hope Clerks of Vestries and District Boards will respond to the letter addressed to them by the Vestry Clerk of Hammersmith with the view of supporting the intended application of the London County Council to the Board of Trade to hold an inquiry into the management and working of the gas companies supplying the metropolis, with a view to ascertaining whether there is any reason why the gas supplied to consumers on the north side of the Thames should be charged at a higher rate than that supplied to consumers on the south side, and whether measures can be taken for securing a uniform rate of charge by all companies supplying gas to consumers residing in the county of London; such inquiry to include the question of the advantage or otherwise of enriching the standard of gas and the use of portable apparatus for testing same. It is really time this rank robbery on the part of certain gas companies should end. If private consumers choose to be fleeced in this fashion, there is certainly no reason why the public authorities should submit to it, and it behoves every local authority to back up the action of the London County Council enthusiastically.

I was finishing my tomato soup at the Temperance Hotel, Doncaster, the other day, and had just ordered chicken and bacon and bread-sauce to follow, when I turned to the outside front cover of the *menu*, and there I read at the top:—

Herbert Athron,
Architect and Surveyor, Auctioneer and Valuer,
House and Estate Agent.
Property bought and sold on commission. Houses let for
race week. Valuations for mortgages or probate.
Dolphin Chambers, Market Place.

I am glad to give this additional advertisement to this enterprising Doncaster "architect and surveyor." It is not so attractive, of course, as it appears on the *menu*, where it is suggestively flanked by a group of appetising fishes on one side, and a noble sirloin on the other, comestibles which I trust duly reward the business-like enterprise of the advertiser. There is no time like after dinner to approach a possible client—possibly one who has made a good thing in "race week" into the bargain, and as to its being "unprofessional"—who cares nowadays?

Bumbledom, it seems, is compelled to allow Kensington Gardens to be smoke-dried. At the south-western corner of the gardens there has been erected a huge building, which, after lying vacant for some years, has recently been opened as an hotel. From its main chimney there now issues at all times of the day a volume of dense smoke, which exceeds in density and energy the performance of the most refractory of black-country chimneys. The wind usually setting towards the gardens, this smoke fills and vitiates the air even to the further side of the round pond, and covers the whole of the area most usually resorted to by children as a playground. Its noxious effects are thus widespread in the summer; they will be still more so when the foggy days hold them earthwards. The reason the nuisance is allowed to continue—so Mr. Marcus B. Huish says, in a letter to the *Times*—is, that the hotel is not in the parish of Kensington, but in that of St. Margaret's, Westminster, whose municipal offices and officers are some miles away, and, presumably, careless about the contamination of Kensington Gardens. Such is vestrydom!

The paper read by Mr. Thomas J. Bailey, F.R.I.B.A., the architect to the London School Board, on the "Architecture and Hygiene of Schools," a report of which is given in the present issue, is of special interest, it sketches the development of the board school as we now see it. Mr. Bailey takes the Hugh Myddelton School as a modern type, and I refer my readers to the plans published in this journal, as upon this type all the most approved schools are now built. Mr. Bailey thinks if any further evolution takes place, it is likely to be in the alteration of the 60 unit for classrooms. In the interests of hygiene I should like to see a little more space in the classroom. It is often very crowded. Referring to sanitary appliances, I was glad to find that the automatic flushing tank and stoneware glazed trough are now used in place of the old arrangements.

The City Church Preservation Society seems to have made some difference in the price fetched at the sale of the site of All Hallows Church, Thames-street, on Tuesday. At any rate, the sum realised, £13,100, was regarded as considerably below the value. A circular was placed in the hands of all who entered the sale-room, purporting to contain "counsel's opinion" that the site could not be legally built on, and that the first attempt to build would be met by legal proceedings. The auctioneer endeavoured to remove the apprehensions of any intending purchasers as to their risk of incurring legal proceedings by pointing out that if opposition should be raised and sustained to the use of the site for building purposes, they would not be compelled to complete the purchase; and he also said that the Ecclesiastical Commissioners had taken an eminent counsel's opinion, and were assured that their action was absolutely legal. It remains to be seen whether the threat of the City church preservers can be made good. I hope it may. Very little, after all, goes to the masses in the suburbs from the sale of these City churches, and they might so easily be profitably utilised, instead of being demolished to make room for Grains and the money-changers.

CHIPS.

Professor Banister Fletcher, F.R.I.B.A., was nominated on Tuesday to represent the City Commission of Sewers at the International Congress of Hygiene and Demography at Buda-Pesth next month.

Lady Galsworthy laid on Tuesday the foundation stone of Brook Hospital, at Shooter's Hill. The new hospital, which is to occupy 32 acres, will accommodate 500 patients and a staff of about 270. The cases treated will be scarlet fever, enteric fever, and diphtheria. The hospital is estimated to cost £200,000, or £400 per bed. Mr. T. W. Aldwinckle, F.R.I.B.A., is the architect.

At Tuesday's meeting of the London County Council the consideration of the proposed improvements at the junction of Wellington-street and the Strand was postponed until after the vacation. A committee recommended that the artisans' dwellings to be provided on the Goldsmiths-row site to accommodate 144 persons, at a cost of £5,953, should be erected without the intervention of a contractor, and that the plans, estimates, and specifications should be referred to the Works Committee for that purpose. They also submitted a similar recommendation with respect to the Cable-street scheme, by which 520 persons will be accommodated at a cost of £19,880, including £500 for a caretaker's lodge. The recommendations were adopted.

A new church is about to be built at Llwydcoed, near Aberdare, from plans by Mr. C. E. Halliday, of High-street, Cardiff.

At a meeting of the Middlesbrough Lunatic Asylum Committee, on Monday, it was resolved to accept tenders amounting to £68,000 for the building of the new asylum.

The parish church of Weobley, one of the finest for size, dignity, and grandeur in the diocese of Hereford, is about to be restored at an estimated cost of £1,500, from plans by Messrs. Bodley and Garner, of London.

New station buildings are being erected for the Lancashire and Yorkshire Railway Company at Broadley, near Whitworth, Lancs. The contractor is Mr. Walker, of Bradford.

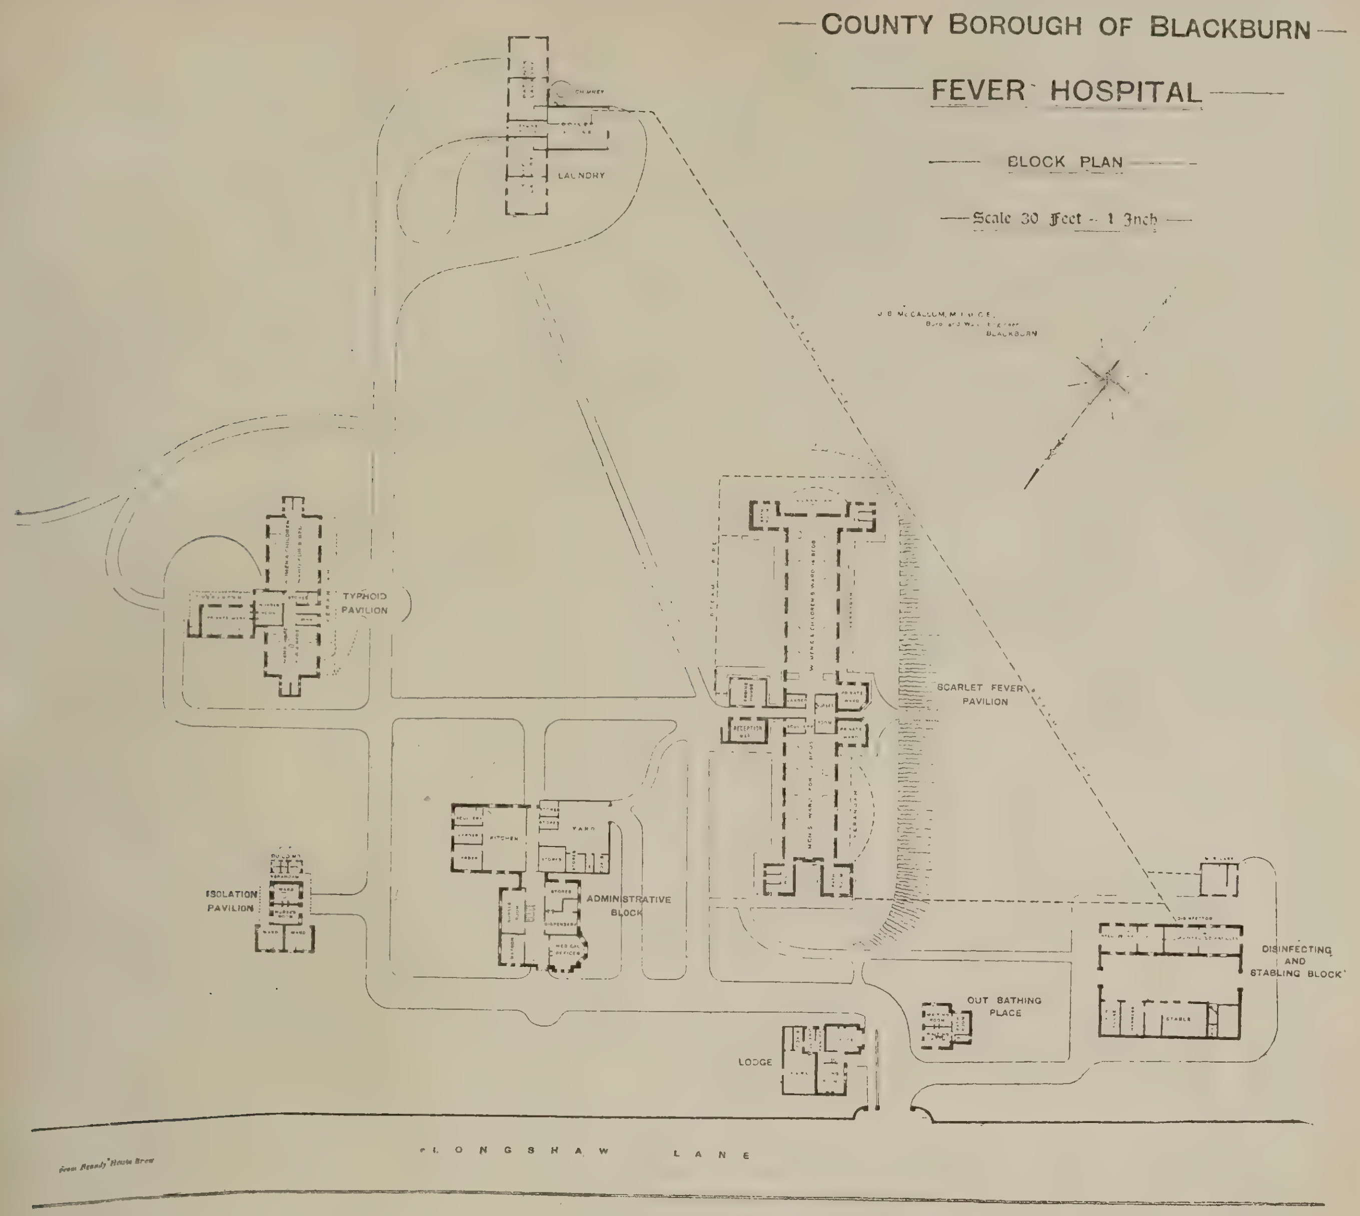
ARCHITECTURAL & ARCHÆOLOGICAL SOCIETIES.

Glasgow Architectural Association.—The members of this association will visit on Tuesday next Belmont Established Church at Hillhead, of which Mr. James Miller is the architect, and will make an excusion to Edinburgh on Saturday, the 25th inst., to see the University buildings. The programme for the ensuing session is as follows:—Sept. 4, Opening address by the president, Mr. Alex. N. Paterson, M.A.; Sept. 29, Visit to Linlithgow; Oct. 2, "Planning of Country Houses," by Mr. William Fraser; Oct. 6, Visit to Paisley; Oct. 16, "The Abbeys and Cathedrals of Scotland," by Mr. P. M'Gregor Chalmers; Nov. 6, "On Tramp," by Mr. J. Kennedy Hunter; Nov. 2, Lecture by Mr. James Chalmers; Nov. 30, Annual Conversazione and Dance; Dec. 4, "Planning of Farm Houses," by Mr. Chas. J. Davidson; Dec. 18, "The Thirteenth and Fourteenth Centuries in Italy," by Mr. T. L. Watson; Jan. 8, 1895, "Monumental Buildings," by Mr. W. J. Blaine; Jan. 22, "An Architectural Chat," by Mr. J. A. Morris; Feb. 5, "The Development of School Planning," by Mr. R. W. Horn; Feb. 19, "The Monks and their Abbeys," by Mr. Henbest Capper; March 5, "The Early Development of the Christian Church," by Mr. W. J. Anderson; April 2, "The Work and Influence of the Brothers Adam in Scotland," by Mr. John White; April 20, Visit to Stirling; May 6, "Decorated Gothic," by Mr. D. B. Dobson; May 24, Visit to Douglas; and, June 3, Annual Business Meeting.

Kent Archæological Society.—The annual meeting of this society was opened at Faversham Town Hall on Tuesday, under the presidency of Earl Stanhope. After the adoption of the report and the re-election of officers, visits were paid to the parish church and to the old grammar school, erected in the 15th century and recently converted into a Freemasons' hall. At Davington the priory and the Norman church of the nuns, erected on the site of a Saxon church, were seen, and the next visit was to Preston parish church, within the borough, at which the Rev. Canon Scott Robertson acted as guide and lecturer. In the evening the annual dinner was held in the drill-hall. At a meeting which followed papers were read by Mr. George Payn (hon. secretary), Mr. F. F. Giraud, and the Rev. C. V. Collier.

The Royal Archæological Institute.—This Institute has been holding its annual congress during the past week at Shrewsbury, under the presidency of Sir H. H. Howorth, M.P., F.R.S., whose inaugural address, dealing with anthropological topics and tracing all Teutonic art to Byzantine sources, was delivered at the Guildhall on Tuesday week. In the evening of the same day the Architectural section was opened with an address by the president of the section, Mr. C. J. Ferguson, F.S.A., and a lecture was given by Mr. W. H. St. John Hope on "Monastic Arrangements," illustrated by restored plans of all the abbeys in Salop. On Wednesday an excursion was made to Pitchford Hall and Church, Acton Burnell Church, the Castle and Parliament House, Langley Chapel and gateway of Manor House, and Condover Hall and Church, the Rev. T. Auden, F.S.A., vicar of Condover, and chairman of the Shropshire Archæological Society, acting as guide. In the evening the antiquarian section was opened with an address by Mr. Stanley Leighton, M.P., and Mr. J. T. Micklethwaite, F.S.A., gave a paper on "Monastic Life," followed by one from Mr. Mill Stephenson, F.S.A., on "The Monumental Brasses of Shropshire." On Thursday the members visited Shifnal, Tong, and Donnington churches and Lillieshall Abbey, and an address was given in the evening by Mr. W. H. St. John Hope. Other rounds of visits were made on Friday and Monday, and on Wednesday the proceedings were brought to a close by a joint-visit with the Shropshire Archæological Society to Clun Castle.

At Peasedown, Somerset, on the borders of the parishes of Camerton, Wellow, and Dunkeston, a permanent stone church has been built by Messrs. Franklin, from designs by Messrs. Bodley and Garner, of Gray's Inn, E.C. The iron church which is thus replaced has been re-erected at the Causeway, Fishponds, near Bristol. It is 92ft. by 26ft., and stands on a brick foundation, with concrete flooring. The removal and re-erection have been carried out at a cost of £600 by Mr. C. Hayes, of Thomas-street, Bristol, under the direction of Mr. R. Cridland, architect, of that city, and the reopening service took place on Saturday.



BLACKBURN FEVER HOSPITAL.

This fever hospital, opened by the mayor on July 25th, is situated at Longshaw, in the borough of Blackburn, about 250 yards west of the old Roman road leading from Edgeworth to Blackburn. The site of 10½ acres is inclosed by a boundary wall 6ft. 6in. high. A stream runs through the site, affording a good outlet for subsoil drainage. On entering the gates there is a porter's lodge on the left hand, which contains an office, kitchen, scullery, two bedrooms, bath, lavatory, and w.c. The out bathing place is opposite the lodge, and to the right of the entrance gates. There are two waiting rooms, 10ft. by 12ft, also bath, lavatory, and w.c. It is intended that it shall be used principally as the final disinfecting and discharging place for patients. A patient, before being discharged, will be admitted into one of the waiting-rooms, will bathe, and then receive his disinfected clothes in the other waiting-room (discharging-room). The discharging-room will thus be kept free from infection. Besides patients, it may often be desirable to disinfect here persons who have been in contact with infectious disease, either at the hospital or in the town. The danger from visitors whom it may be necessary to admit to the wards will in this way be much diminished.

The administrative block situated to the left of the main entrance, is three stories high, and contains accommodation for the medical officer, matron, and nurses, with 16 bedrooms, baths, lavatories, and w.c.'s. Hydrants are placed on the landings of all floors of this block, with a 3in. hose-pipe 30ft. long attached, and can be readily used in case of fire. A detached portion of the administrative block, one story high, contains kitchen, scullery, dairy, pantry, larder, &c., and is placed in such a position as to afford easy access to the various wards in which provisions, &c., are required. The pavilions, two in number, consist of long one-storied buildings, divided into two main wards by the nurses' room and scullery. The absence of crevices liable to collect dust is one of the special features of the pavilions. The angles between floors, walls, and ceilings have been carefully rounded off. All the floors are formed of oak blocks, laid on 4in. of concrete and 2in. of cement. The scarlet-fever pavilion lies to the right of the administrative block, and contains the following wards:—men's ward, 60ft. long by 24ft. wide, and affords accommodation for 10 beds. The women and children's ward is 84ft. long by 24ft. wide, and accommodates 14 beds. There is a private ward to each of these containing one bed. The two main wards are separated by the nurses' room, 18ft. long by 11ft. wide, and is situated so as to afford perfect control over the wards. Crossing the corridor, and immediately opposite the nurses' room, is the scullery and larder. There is also an isolated reception ward and small ventilating engine house at the entrance to this pavilion. Lavatories, bath-rooms, with movable baths and sprays, w.c.'s, sinks, &c., are provided in both the men's and women's wards. A verandah, to which patients can be easily wheeled, has been erected on the west side. The typhoid-fever pavilion lies to the rear of the administrative block on the left hand, and provides accommodation for four beds in the men's ward and six beds in the women's and children's ward. The two wards are separated partly by a corridor 13ft. long by 9ft. wide, and partly by the nurses' room. Full control over both wards can be obtained by means of windows placed in the nurses' room. A private ward, 24ft. long by 12ft. wide, containing two beds, lies to the rear of the nurses' room. Lavatories, baths, w.c.'s, scullery, linen and food stores have been erected in suitable positions. The wards are heated by Manchester grates, placed in the centre of the floors. A verandah runs the length of the entire building on the west side, for the convenience of convalescent patients. The isolation block is situated immediately to the left of the administrative block, and contains three single wards, 13ft. long by 11ft. wide, with nurses' room, and outbuilding containing bath, sink, and w.c. An interesting feature of the hospital is the ventilation of the scarlet-fever pavilion. It has been carried out by the Sturtevant Company, and combines heating with ventilation. Air is supplied to the building and withdrawn by means of two fans, worked by a 4H.P. engine. The air is heated before admission by means of steam pipes, around which it circulates. The air is also filtered, and can when necessary be moistened, and to a certain extent cooled. This conditioned air is admitted at a height of 10ft., and the outlets are placed close to the floors under the beds. The extracted air is conducted by earthenware pipes to the laundry chimney. The ventilating pipes are of glazed earthenware, and are so arranged that they can be cleansed. As, however, the air will be filtered before admission, it is not anticipated that there will be much deposit. The cubic space allowed per bed is 2,000ft., and it is found from tests that have been made that 10,000ft. of fresh air per bed per hour can be introduced without the fans having to work at an undue speed. The ventilation of the other parts of the hospital does not call for any special remarks. It is carried on by fireplaces, ventilating stoves, ventilating gas-lights, and Boyle's patent ventilators. The laundry lies to the extreme south of the site, and contains patients' laundry, engine house, staff laundry, boiler house, and chimney 90ft. high. The patients' laundry is entirely cut off from the staff laundry. There are in each laundry wringing and boiling machines, steeping tanks, draining troughs, rinsers, ironers, and drying machines. A shafting from the engine-house runs the entire length of both laundries, and is connected by means of driving-belts to the various machines. Steam and hot and cold water are connected to all appliances. The disinfectory, stabling, and mortuary block faces Longshaw-lane, to the west of the site. The disinfector occupies a building 24ft. long by 12ft. wide, and has two entrances. The stabling accommodation includes harness room, coach-house, and a four-stalled stable, with hay-loft, &c. Close to the disinfector is the mortuary, and post-mortem room. The disinfector was made by Messrs. Goddard, Massey, and Warner. The disinfecting agent, superheated steam, can be obtained either from the laundry boiler or from the small boiler which forms part of the apparatus. Special means are taken for preventing any undue condensation of moisture on the sides of the chamber or on the articles. Some condensation is unavoidable, and to dry the clothes hot air is admitted into the chamber from around the fire. Infected clothing is taken into the building by the east entrance, and removed from the west, so that one-half of the building is kept quite free from infection. The disinfector will serve not only for the hospital, but for the whole town. The grounds of the hospital are drained by means of surface or tile drains. These consist of round hard-burnt clay pipes, 6in. in diameter, laid 3ft. apart and 1ft. deep, with an inclination of about 1ft. in 50ft. towards the west side of the site. A 9in. drain connects these at the boundary wall, and finally discharges into the brook running through the grounds. Tile drains are laid round all buildings at a depth of 1ft., and covered with 6in. of broken stones. These are laid in addition to a damp-roof course on all foundations, to insure perfect dryness in the walls. All drains, before entering any building, are disconnected by means of Buchan's disconnecting traps, built into manholes. The soil pipes from the various closets are ventilated by means of cast-iron pipes carried up the walls to about 3ft. above the eaves of the roofs. All water closets, sinks, and hoppers are of the most modernised type, with patent flushing apparatus, and have been supplied by Messrs. Doulton and Co., of Lambeth, and Messrs. Twyford and Co., of Hanley. The present accommodation provided is: In scarlet-fever ward, 26 beds; typhoid-fever ward, 12 beds; isolation ward, 3 beds. This is allowing 2,000c.ft. of air space for each bed. The accommodation can at any time be increased to 55 or 60 beds. There are also 16 beds provided in the administrative block for the use of the staff. All outside walls are formed of bricks, with Yorkshire stone dressings. All walls, ceilings, coves, &c., have been plastered and finished with patent adamant plaster, supplied by the Patent Adamant Company Limited, of Birmingham. Electric bells have been fitted, also telephones which connect each block of buildings with the officers' quarters, and likewise with the central. The plans for the hospital were prepared and carried out by the staff of the borough engineer (Mr. J. B. McCallum, M.Inst.C.E.) with the medical assistance in the first instance of Dr. S. Barwise, formerly M.O.H. for Blackburn, now county medical officer for Derbyshire; and secondly, as regards all recent medical details, by Dr. J. Wheatley, M.O.H. of the county borough of Blackburn. The chief contractors were: for masonry and brickwork, J. Whittaker; for joinery, Kenyon and Moulding; for plumbing, E. Cunliffe; for painting, John Hargreaves; for plastering, A. Airey; for flagging and slating, R. and T. Seed; all of Blackburn. The total cost, including land and furniture, has been about £21,000.

◆

In answer to an appeal from Mrs. Humphry Ward, Mr. J. Passmore Edwards has intimated his willingness to provide the necessary buildings for the extension of University Hall Settlement in Somers Town, provided the site be secured. It is proposed to erect a concert room holding 600 persons, library, reading-room, gymnasium, and classrooms.

COMPETITIONS.

Coventry.—The scheme for the erection of more adequate municipal buildings for this rapidly growing city made some further progress on Tuesday, when the city council decided to institute a competition for the buildings, and to appoint Mr. Charles Barry, F.S.A., of Westminster, as assessor, at a fee of 110 guineas. Competitive designs will be invited from architects practising in Coventry, and from a limited number of others to be selected by the committee. A premium of £150 is to be offered for the best design, and £50 each for the designs placed second and third in order of merit by the assessor. The plans and design placed first in order of merit, and in respect of which the premium of £150 is paid, will remain the property of the corporation, all others being returned to their respective authors. An ominous paragraph in the committee's report, which was adopted, recommended: "That competitors be informed that, as the council is uncertain when, if ever, complete municipal buildings will be erected, they are unable to agree at present to employ the author of the design placed first to carry it out; but that they do propose, if no insuperable objection exists, to employ him to carry out such portion of it as can at once, or from time to time, be undertaken, on the usual professional terms, such portions to be so arranged as to be part of the entire design, and consistent with its future complete realisation. That they also agree to pay the author of such design (or his representatives) 1¼ per cent. on the estimated cost of the unexecuted portion of his design, if within seven years from the choice of the same no instructions are given for the completion of the buildings, having due regard to any portions which may then have been executed by the architect."

Darlington.—A special meeting of the Darlington School Board was held at the School Board offices on Tuesday afternoon, to receive and consider the report of Mr. E. R. Robson, architect, London, on the competitive plans for the new schools in Corporation-road, who places the designs in the following order: 1st, "Q. E. D.," by Messrs. Clark and Moscrop, Darlington. 2nd, "1894," by Messrs. Clark and Moscrop, Darlington. 3rd, "Up to Date," by Mr. G. G. Hoskins, Darlington. 4th, "Progress," by Mr. Frank Martin, Darlington. 5th, "Lux," by Messrs. J. P. and H. D. Pritchett. Mr. J. Hall occupied the chair. The chairman said Mr. Robson had gone very carefully into the designs. They proposed, therefore, to employ the author of "Q. E. D." as the architect for the new schools. The motion was then put to the meeting, and carried unanimously.

Monument to Thomas-a-Kempis.—A committee has been formed, having for its object the collection of subscriptions, for the erection of a monument in Holland in honour of the venerable Thomas-à-Kempis, Prebendary of the Order of St. Augustine, and the well-known writer of the "Imitation of Christ." In order to be able to erect the monument, this committee wishes to start a competition. Artists in Holland and abroad are invited to compete. The monument must be erected in the style of the 15th century, and must be of solid stone. It will be placed in the Catholic Church of St. Michael, Zwolle (Holland). The cost must not be more than 10,000fls. (£840). All competitors are required to send in structural drawings, and carefully prepared sketches. The first prize will be 1,000fls. (£84), and the second prize 500fls. (£42). All designs must be received on or before the 15th January, 1895. The committee is composed of eight clergymen, presided over by the Reverend Canon L. B. Mulder, of Wolvega, Holland. The jury consists of two architects, three clergymen, one sculptor, and an art-expert and antiquarian. All wishing to take part in the above competition, can get all directions and requirements by directly applying to Mr. H. B. G. Molkenboer, Vossiusstraat 50, Amsterdam.

Rochdale.—The town council have decided to institute a limited competition, restricted to eight architects, for the Technical Institute and Free Library to be built on the Green, and to give each competitor a sum of 75 guineas for his design, the author of the selected design to be employed to carry out the work on the usual terms. The total cost of the building is limited to £40,000, and Mr. MacVicar Anderson has been appointed the assessor.

Salford.—The Salford School Board, having recently invited competitive designs from five firms of architects practising in Manchester and Salford for the erection of new schools, Marlborough-road, Hightown, have chosen for execution the scheme submitted by Messrs. Woodhouse and Willoughby, FF.R.I.B.A., of 109, King-street, Manchester. Provision is made for 870 scholars, 450 infants on the ground floor, and 420 girls on the first floor. A gymnasium and cookery classroom are also provided. The school is on the central hall principle. The front elevation is intended to be faced with Ruabon stocks and terracotta. The estimated cost is about £9,000.

Sheffield.—At the last meeting of the Sheffield School Board a committee reported that fourteen sets of designs had been sent in by architects practising in the city for a proposed school at Tinsley Park-road. Those by Messrs. Holmes and Watson, of St. James's-row, Sheffield, were selected for execution, and they were appointed architects. A premium of £15 was awarded to Mr. C. J. Innocent, and £10 to Mr. W. J. Hale for the second and third best plans.

Yorks, North Riding, C.C. Offices.—The five architects invited to compete for above—viz., Messrs. Brierley and Demaine, York; Messrs. Clark and Moscrop, Darlington; Messrs. Broderick and Smith, Hull; Mr. C. H. Fowler, F.S.A., Durham; and Mr. C. J. Ferguson, F.S.A., London, have sent in their designs for above. At a committee meeting of the council it was decided to ask Mr. Alfred Waterhouse, R.A., to assist in the selection. Each of the invited architects receives a premium of £25.

CHIPS.

Adjudications in bankruptcy have been made in the cases of John Pearce Flew (trading as Flew and Co.), of Glasbury-road, late Bank-buildings, West Kensington, W., builder and contractor; and George Pluckrose (trading as William Oldrey and Co.), Carlton-bridge, Westbourne-park, W., builder.

A new Congregational church is to be built at Grange-over-Sands, to accommodate about 340. The tender of Mr. Jas. Garden, of Dalton-in-Furness, for the whole work having just been accepted. The total cost will be about £2,250. Mr. E. Howard Dawson, A.R.I.B.A., of Lancaster, is the architect, and has also in course of preparation plans for new churches for the same body at Dalton and at Carnforth.

The local board of health of Merthyr Tydfil have adopted plans by Mr. E. A. Johnson, M.S.A., Abergavenny, for new public offices and a county court.

The new coast electric tramway between Douglas and Laxey was formally opened to the public on Saturday. An inaugural party, among whom were Dr. Hopkinson, of the firm of Mather and Platt, Manchester, consulting electrician to the company, and Mr. F. Saunderson, C.E., the company's engineer, travelled from Douglas to Laxey by special car, the distance of eight miles along the cliffs being covered in a little over half an hour.

The memorial-stone of the Verdin Technical Schools, at Winsford, will be laid to-morrow (Saturday) afternoon. The building is in course of erection from plans by Messrs. Woodhouse and Willoughby, of Manchester.

The foundation-stone of the Memorial Cottage Hospital at Crewe was laid on Saturday. It is being built at a cost of £2,800 on a site near the entrance of the Queen's Park. Mr. C. R. Woodbridge, of Edleston-road, Crewe, is the builder.

The chancel and transepts just added to Plaxtol parish church, Kent, were consecrated by the Archbishop of Canterbury on Wednesday.

The first section of the Mary Cross Deaf and Dumb school for North and North-East Lancashire was opened at Preston by Earl Derby on Saturday. The building at present provides accommodation for 50 children, and has cost £5,200. Messrs James and Green, of Blackburn, are the architects.

New schools added to St. Peter's Church, Stockport, were opened last week by the Bishop of Chester. The cost has been nearly £4,000. The building is of brick with Ruabon terracotta dressings. Messrs. Woodhouse and Willoughby, of Manchester, were the architects, and Messrs. T. and W. Meadows the contractors.

The annual report of Mr. Hainsworth, inspector of buildings under the Leeds Corporation, shows that the 2,017 new buildings approved during the year include 9 villas, 30 semi-detached villas, 586 through houses, and 1,392 back-to-back houses. Among 45 miscellaneous plans were two churches, four chapels, one addition to church, two additions to chapels, five mission-rooms, a synagogue, four schools (two with swimming-baths attached), and seventeen additions to schools.

Building Intelligence.

Caerphilly.—The memorial-stone of a Congregational chapel, replacing on a fresh site one used for many years past, was laid on Wednesday week. The style of the new building is a free treatment of Gothic, and the church is built of local and Pontypridd stone, with dressings of Bath stone. It will accommodate about 520 worshippers, and has a gallery over the entrance and at the two sides. At the rear is a schoolroom to accommodate about 200, and a vestry and classroom are also provided. Behind the pulpit is a large organ-chamber, with provision at the front for the choir. This is reached by a separate stair from the schoolroom entrance. The chapel measures internally 51ft. 6in. in length by 36ft. in breadth, and the schoolroom 20ft. by 36ft. respectively. The architect of the building is Mr. John H. Phillips, St. John's-chambers, Cardiff, and Caerphilly; and the builder is Mr. Thomas Rossiter, of Caerphilly, the amount of contract being £1,500.

Handsworth.—The foundation stone of the enlargement of St. James's Church, Handsworth, was laid last week by the Earl of Dartmouth. A few years ago the recess at the east end was replaced by a chancel. The work of renovating the nave was intrusted to Mr. J. A. Chatwin, of Birmingham, who has prepared designs in the Geometrical style, which will be carried out by Messrs. Barnsley and Sons. It is proposed to remove the galleries and the south aisle, building in place of the latter a large nave, the present chancel and remaining portion of the church constituting a north aisle. A new chancel and south aisle, with chancel arch, over which will be placed an organ-chamber, will also be constructed. At the west end is to be erected a lofty baptistery. The new portion will be externally faced with brick with Hollington stone dressings, the interior having Bath stone dressings and spaces between stuccoed. The roof will have massive timbers, and be boarded. There will also be choir and clergy vestries. In dimensions the new nave will be 38ft. by 22ft., the chancel aisle 20ft. by 15ft., and the south aisle 86ft. by 15ft. The cost is estimated at £8,000.

Newcastle-on-Tyne.—The corner stone of the Masonic Hall for Northumberland was laid in Pilgrim-street, Newcastle, with Masonic pomp last week. The style is Classic. The grand entrance leads direct by "seven" steps to the central lobby, and to a spacious corridor leading to the retiring rooms for both ladies and gentlemen, the whole of the ground floor being devoted to public reception and ball-rooms. The large ball-room is 72ft. long, 36ft. wide, and 25ft. high, and it is arranged, not only for use as a dancing-room, but for large meetings, concerts and lectures, and for Masonic banquets. It will accommodate between 500 and 600 persons for meetings, 150 to 200 couples for dancing, and for 250 diners at banquets. The cost of the hall, exclusive of site, will be from £14,000 to £15,000. The architect is Brother J. Johnson, Queen Victoria-street, E.C., whose designs were selected in competition by the arbitrator, Brother Chas. Barry, P.G.S. of Works, England, and the builders are Messrs. J. and W. Lowrey.

Shedfield, Hants.—The modern parish church of St. John the Baptist, Shedfield, is being completed by the erection of a north aisle and porch. The building is Decorated in style, and has been erected from designs by Mr. John Colston, F.R.I.B.A., of Winchester. The first portion of the parish church, which replaced an ugly brick edifice reared at the beginning of the century, was built in 1875-80, by Messrs. Knight and Son, contractors, of Wickham, at a cost of £5,763. That contract included nave, chancel, south aisle, and transept, and base of south-west tower. In the year 1887 the tower was completed, and now contains a peal of six bells. The north aisle and porch are fast approaching completion; the contract for the work, under the direction of Messrs. Colson and Son, the architects, having been taken by Messrs. Rapley and Son, builders, of Gosport. The carved capitals and sculpture on the first portion of the church was the handiwork at the time of Mr. Harry Hems, of Exeter. Messrs. Harry Hems and Sons have just done the carved work in the new north aisle. The total cost of the church has been close on £2,000.

Staines.—The new church of St. Peter, Staines, built at the cost of Sir E. Clarke, M.P., was consecrated by the Bishop of Marlborough on Saturday last. The architect is Mr. George H. Fellowes Prynne, F.R.I.B.A., of 6, Queen Anne's Gate, Westminster. The tender of Messrs. Goddard and Sons, of Farnham, for £6,000 was accepted, this sum being exclusive of the tower and spire, which have since been given by Sir E. Clarke at an additional cost of about £1,400. The screen has also since been given at a cost of nearly £300. The style chosen in design is a free treatment of Perpendicular in red brick and stone. The nave is of four bays 26ft. by 80ft., having a height of 40ft. to the apex of the waggon roof. The chancel is of the same width and height as the nave. Aisles are thrown out on the north and south sides of the nave. There is a narthex at the west end, with western entrance. The tower, which is placed at the south-west end of the south aisle, is in three stages, and capped with a copper-covered spire. In the lower stage, on the nave-floor level, a baptistery is formed. The upper stages are ornamented externally with panelled work in brick and stone. A southern transept, with separate entrance, forms the nave of a small chapel on the south side of the chancel. On the north side of chancel are clergy and choir vestries, with the organ-chamber. The altar is elevated by nine steps from the nave-floor level. A unique feature of the church is the constructional rood-screen, which is carried right up into the chancel arch, the upper portion of which is enriched with tracery. The central figure and rood are designed to be cut out of the solid stonework of the tracery, and the side-figures placed on corbels formed in the panels of the tracery. All the sculptured work has been done by Mr. J. Taylerson, of Lavender-hill; Mr. W. H. Augur, of Staines, has acted as clerk of works; the stalls and altar (which is decorated in gold and colour) have been carried out from the architect's designs by Messrs. Lonnie and Co., of Camberwell; the iron screen work, chancel gates, and door furniture have been made by Messrs. Singer and Sons, of Frome. The dossal is a very handsome piece of work, made of white and gold tapestry of Tudor pomegranate design, with three orphries of crimson silk plush trimmed with rich crimson and gold silk lace. This, together with the side hangings, forms a most effective decoration of the east wall. They have been supplied by Mr. Alfred Stalman, of 67, Frith-street, Soho, London.

CHIPS.

The inauguration of a new organ took place on Friday at Ayton Parish Church, N.B. The organ has been erected at a cost of about £1,000, and is fitted up with hydraulic engines and patent starters by Messrs. Melvin and Sons, Glasgow.

The ratepayers of St. Pancras have again voted against the proposal to adopt the provision of the Free Libraries Acts in that parish.

An organ, built by Mr. Howles, of Bristol, was opened last (Thursday) night at the Hill-road Congregational Church, Clevedon, Somerset.

Christ Church, Rotherhithe, is to be restored and reseated under the superintendence of Messrs. Newman and Newman, of Tooley-street, London Bridge, S.E.

Under the will of Sir Austen Henry Layard, after the death of Lady Layard, the portrait of his uncle, Benjamin Austen, by Sir Martin Archer Shee, P.R.A., is to be presented to the Incorporated Law Society. All his other pictures (excepting portraits) are then to be offered to the trustees of the National Gallery. The portraits are left to his nephew, Captain Arthur M'Gregor Layard.

The members of the Hampshire Field Club visited the Isle of Wight on Thursday in last week, when they inspected St. Thomas's Church, Newport, rebuilt in 1854, on the site of the one erected in 1180, and afterwards roamed over Merston Manor House, a Jacobean mansion, and the church and castle at Carisbrooke.

A Select Committee of the House of Lords have decided to allow the London, Walthamstow, and Epping Forest Railway Bill to proceed. By this Bill, which has already passed the House of Commons, a new company is incorporated with powers to construct a railway commencing at South-place, Finsbury, passing northward through St. Luke's, Hoxton, Shoreditch, Kingsland, Hackney, and Upper Clapton, and southward through Walthamstow and Leyton to Chapel-end and Chingford, whence it will skirt Epping Forest and terminate at High Beech. Between Upper Clapton and High Beech the railway will form junctions with the Midland and Great Eastern Railway systems.

Correspondence.

ASSISTANT SURVEYORS, WAR OFFICE.

To the Editor of the Building News.

Sir,—After reading the words "so well ventilated" in the opening paragraph of the letter written by "One Who Is In It," in your issue of July 27, my eyes fell on the heading "Sewer Ventilation" in the next column, and I could not help thinking that the theory advanced by Mr. Hurst as to the dangers of indiscriminate stirring up of dirty puddles is very applicable to this discussion concerning the R.E. Department.

Such unpleasant verbal microbes as "dirty work," "wishing to pose," "act for their individual gain," "disagreeable military duties," &c.—granting for the moment that they are all true, and well deserved—would be much better sealed up; or, if they must find vent, filtered through metaphorical cotton wool.

It is pretty certain that the last discussion did more harm than good to us, because of the numbers of these microbes which found vent then. I would venture to suggest that more moderate language should be employed if this correspondence is to continue. Those of us who are most dissatisfied, who see no good at all in the existing arrangements, must allow that they cannot hope, by a few letters in this or any other paper, to upset the whole department—even if that were desirable. Pulling down the Temple of Dagon required the muscles of a Samson, and was his last resort when nothing was left to be hoped for but revenge—a pass to which I should be sorry to think we have come.

I think the calculations as to promotion are erroneously pessimistic. I admit that if every one of the present staff survives in health and strength and remains in the department until he is 65, the figures are right. I have in my possession a diagram, corrected to date, which shows all the life-history of each man, and it is not a pleasant object of study for the assistant who happens to have his name in the second column of the Army List. But I find that of 62 names in the list for 1879, only 14 will be left at the end of this year, and 20 names will have been struck out of the list printed privately in 1889. This seems fairly strong evidence that retirements will average between three or four per annum. I give this suggestion for what it is worth. Some of the retirements and deaths will, of course, be among the assistants themselves.

I wish, however, principally to notice the argument stated in these words: "They hide the workers and blind the eyes of the public."

First, then, I have heard the same language used in private offices. All civilian architects and engineers are not superior in every way to their head draughtsman, and Tom Pinch is not unknown in Great George-street or Bloomsbury. The leader in last week's Building News affords some interesting reading in this connection.

Second, and now I feel I am going to wave the red rag in earnest. *An ornamental head to the department is a necessity.* Is there any one in the R.E.C.S. so extremely—what shall I say?—trustful (?) as to think that when the Temple of Dagon has collapsed with a mighty crash, and the dust has cleared away, we shall be discovered unhurt, sitting on the top of the ruins, the chief surveyor rechristened "Chief, Army Works Department," at the present I.G.F.'s salary, and all the rest of us smilingly perusing our appointments to lucrative posts under him? No, the present staff of Tom Pinches would remain (*perhaps*) in the same position, the only change would be that a new set of superiors would be put over them, civilians this time. "Iniquitous!" you say. Well, perhaps I agree with you; but are we singular in this respect? I fancy I have heard Radical politicians attacking the existence of the Queen and Royal family on precisely the same grounds. There we have Pecksniff, a host of Pecksniffs, *in excelsis*. Show me any public department without its ornamental head; I will go the length of saying its *useless*, ornamental head, and then we can begin to clamour for an entirely middle-class works department, in which every man shall be estimated at, and paid according to, his true worth. In the present state of society in this country, the head officials of the Army Works Department must be drawn from the same class as the heads of all other departments, and we practical men cannot evade that fact, though some of us appear to forget it occasionally. Some of us have an idea that the importation of the German system would end our woes. It is doubtful. We are not in possession of any details as to who the German civilian architects are, and how they are treated. Newspaper reports as to the behaviour of German army officers towards civilians are not encouraging.

I could write much more on this subject, but I shall probably have to supplement this later on. In case, therefore, I should be misunderstood to mean that I have no fault to find with the existing status of the R.E.C.S., I will now give a short list of my principal grievances.

1. The premium on celibacy. In the case of our married men, their wives' and families' passages should be paid, and a fair allowance of luggage made for each person, stating a maximum, if necessary.

2. The vacancies in the higher ranks should be filled up.

3. Travelling allowances are meagre, and surveyors are forced to use second-rate hotels, or supplement the rate out of their own pocket.

4. Married men to have quarters. A constant source of loss is having to leave a place with a house on one's hands.

The above are financial. The following may be termed administrative :—

5. The placing of the staff to be more in the hands of the chief surveyor than it now is apparently. All assistants to have at least six months with others senior to them, before being stationed alone.

6. District surveyor to have a better-defined position—i.e., as regards the public. His name to appear, as a matter of course, in all directories, lists of staff, &c., in a way to show that he is an important wheel in the machinery. We should not then have regimental officers asking, "Who, or what, is the surveyor?"

7. Abolish the term assistant surveyor, and alter the R.E. regulations defining his duties.

8. I think we could all do without the M.F.W. A chapter might be written on him; but I refrain.

I must stop—not that I have exhausted the subject, or even the list of grievances; but this letter is, I am afraid, too long. The social question I should like to take up at another time, if opportunity offers.

This I must say, however: that if anyone is deterred from entering the department by the letters which have been written, *will it not be the best men—the men we want?* Have your correspondents considered this?—I am, &c.,

Balbus.

Sir,—Will you allow me the use of your columns to endorse all that has been written by "One Who Was In It" in his letter of warning to intending candidates for appointment as above. Intending candidates should not lose sight of the following facts :—

That as surveyors of the civil staff, Royal Engineers, they are "bossed" by military officers who have no professional knowledge or experience.

They can never, as the conditions of the Service now are, become the head of their department, but are subject at any age, and after any length of service, to be put under the direction of an officer, greatly their junior in age and service, who, the authorities say, must always rank senior to civilians on account of his military commission, even though that officer be a newly-joined subaltern or recently promoted non-commissioned officer.

The prospect of earning £500 per annum is so very remote that it should be left out of consideration altogether. Candidates now joining must expect to be about 25 years as assistant surveyors—that is to say, that for 15 years or so they must remain at the maximum of £280 per annum.

That the life of a surveyor R.E. is one of utter isolation and social ostracism, due to the fact that the officers with whom they serve either thoughtlessly or wilfully ignore them, outside their official duties, and by their behaviour create the impression in minds of others that they are simply civil subordinates of the Department, and the regulations as to status, &c., are so very vaguely defined as to support them in this view. The relative rank which is assigned to surveyors is lower than that of any other Army Department, and as the status of officers of the Army is judged by the rank individuals can rise to, they suffer accordingly.

All work turned out by the surveyor is appropriated by the Engineer officer as his own—the surveyor gets no credit for the work he performs, nor is he officially recognised in connection therewith.

In proof of this, take the type plans and specifications issued from the War Office, which have the signatures of engineer officers prominently on them; the signatures of the civil surveyors and draughtsmen who prepared them never appear. In the advertisements for War Department contracts in the columns of professional and other papers, the Colonel R.E. is conspicuously to the fore, but no mention is made of the R.E. surveyor, who supplies the plans and affords the necessary information to the contractor.

In conclusion, let me advise intending candidates only to seek appointments in the R.E. department as a last resource; the Office of Works, the Admiralty, the London County Council, and other public bodies offer appointments which, although they may not appear so lucrative at first, are far worthier the consideration of really good professional men than the R.E.D. Until there has been a Royal Commission of inquiry and the conditions of service entirely altered, the War Department should be left severely alone; the pay is not what it is represented, as substantial deductions must be made for moves, and the service is irritating, destructive of all zeal and energy, and the social ostracism complete. —I am, &c.,

Truth Will Out.

WINWICK ASYLUM.

Sir,—We note that you have made a reference in your paper to our having been appointed architects for the new Lancashire County Asylum at Winwick. Mr. W. S. Skinner, of this city, is joint architect with us in this matter, and his name should have been coupled with ours.—We are, &c.,

Henry Crisp and Oatley.

Scottish Provident Chambers,
27, Clare-street, Bristol, July 31.

Intercommunication.

REPLIES.

[11183.]—**Levelling with Theodolite.**—In reply to "Theo," a level is better for levelling than a theodolite, other things being equal, on account, for one reason, of its being lighter. Weight is not an unimportant matter. The level has to be carried by the surveyor from position to position all day long, and one's shoulder is apt to become sore with the impact of the level being placed thereon when moving and carrying to the next position, so that the lighter the instrument is, consistent with stability and efficiency, the better. Another consideration in favour of the level is that, weight and size for weight and size, the telescope is longer and larger than in the theodolite. Its greater length permits of the true level being more accurately and more quickly obtained, and its being larger in diameter admits of more light—an important advantage in the dusk or in cloudy weather. Further, in the level the adjustment screws will usually be found with heads of larger diameter than those of a theodolite, and these are more readily acted upon and turned. In severe weather the fingers become somewhat benumbed with the cold, and it is troublesome to work with small screws. These are the chief advantages which the level possesses for levelling over the theodolite. The latter instrument, however, can be used for such work as levelling, and theoretically is as perfect; but as a matter of practice, it is open to the objections above indicated.—Charles F. Crapp, Birmingham.

[11184.]—**Heraldic Supporters.**—I have been in communication with Sir Albert W. Wood, College of Arms, and would gladly send "L." and "Y." his reply if they think fit to communicate with me.—Edward Griffith, 30, Grosvenor-street, Chester.

[11186.]—**Sewage Filtration.**—In answer to "M.," particulars of the system of filtration of sewage through polarite, and its treatment with ferozone can be obtained from the International Water and Sewage Purification Company, Limited, 7, Victoria-street, London, S.W., and in Mr. W. Santo Crimp's "Sewage Disposal Works" (Charles Griffin and Co., London).—J. T. Rea.

[11186.]—**Sewage Filtration.**—Full particulars of the Ferozone and Polarite system of treating sewage can be obtained of the International Water and Sewage Purification Company, Limited, 7, Victoria-street, Westminster.—Secretary.

[11187.]—**Bridge.**—It seems to me that the question of your correspondent was very well and fully answered in the last number of the Building News, in No. V. of your valuable and ably-written series of articles now in progress, under the title of "Steel Bridges."—Girder.

◆

The parish church in Gunton Park, near Cromer, was reopened on Wednesday by the Bishop of Norwich after extensive restoration.

The Lords of the Admiralty have appointed a small committee to inquire into the proposed erection of extensive naval barracks at Chatham. The scheme includes the conversion of the old convict prison into barrack buildings. The project is estimated to cost over £300,000.

Legal.

RATABLE OCCUPATION.

WHETHER or not the occupiers of certain premises are directly ratable to the poor, is often a matter of much importance in deciding questions affecting their value or suitability for various purposes. The broad principle is of course that the firm having the beneficial occupation of the premises affected is the party to be rated, and not their owner or other person receiving the rent. There are, however, various cases in which occupiers, who would otherwise be ratable, escape that direct liability because of the fact that their occupation is at all times subject to the control of the owner. This is why lodgers, for instance, are not ratable or responsible directly for the rates, although they have, of course, a beneficial occupation. But if, instead of being a lodger, a man becomes a sub-tenant of a part of a house over which the owner or landlord has no control, then his liability to be rated in respect of the premises he occupies at once returns. In a recent case affecting part of the Liverpool Docks, the question was whether the Rochdale Canal Company could be directly rated to the relief of the poor (*Times*, 17 July) on the ground that they had the beneficial occupation of a certain dock as tenants of the Mersey Docks and Harbour Board.

It appeared that under their agreement of tenancy the Canal Company held a certain berth with quay space, cranes, &c., of the board at an agreed rental, and were under various covenants as to repair, while the landlord had the usual powers of re-entry. It was, in short, a regular letting of so much land with water and appliances for use, and as such the premises were clearly ratable to the poor. But the agreement contained a clause under which the Mersey Board had free access to, and complete control over, the portion so sub-let to the Canal Company, and on this ground it was argued that the occupiers of these premises were not directly ratable. The rate had, as a matter of fact, been made and enforced; but the question of law was raised by special case, and it had been decided in favour of the Rochdale Canal Company by a Divisional Court; a judgment now affirmed by the Court of Appeal. The Lords Justices explained that the premises were, of course, ratable to the poor, and they were not discussing the question of any liability for the payment of the rates as between the Canal Company and the Mersey Board. They simply decided that the Canal Company, under the agreement mentioned, were not such occupiers of the premises as made them liable to be rated directly, because they had no such exclusive occupation as would render them thus responsible; being in fact more like lodgers than tenants, so the appeal was dismissed with costs, and the rates must be collected through the Mersey Board, as the occupiers for this purpose.

Fred. Wetherfield, Solicitor.
1, Gresham Buildings, Guildhall, E.C.

Note.—All questions for reply in this column must be headed "Building News," and must reach my offices, as above, by *Tuesday* morning to insure answer same week.

Architect.—Alterations.—Plans.—Payment.—You are entitled to 3 per cent. on estimate for work abandoned, and to the cost of quantities. The subsequent design, &c., is a separate matter, for which about five guineas seems fair. Probably £21 would be a reasonable settlement for the whole bill.

R. W.—Road.—Building Line.—If these houses are built under a lease or agreement, there should have been a clause as to the building line, for breach of which an injunction could be obtained. If not, the adjoining owners could object; but action by the local board would probably be more effectual, and they should be called upon to take steps to prevent this encroachment.

C. P.—Ancient Light.—New Windows.—Either B. or C. can put up a hoarding to block the new lights which A. has opened, and so prevent their becoming ancient lights, unless A. will enter into an agreement and pay a nominal rent. There is no right of action against A. for opening these lights, although they overlook B.'s ground.

◆

Mr. F. J. Williamson, of Esher, has been commissioned to execute a colossal statue of the Queen, to be erected at Rangoon, Burma.

The Works Committee of the London School Board show in their annual report that during the past year 14 new schools were built, to hold 13,669 children, and that the cost of them amounted to £377,278. A number of existing schools were enlarged.

LEGAL INTELLIGENCE.

The Acquisition of Tramways by Local Authorities.—Judgment was given in the House of Lords, on Monday, by the Lord Chanceller and Lords Watson, Shand, and Ashbourne in the appeals raising the question of the liability of county councils when they acquire tramways under their power of purchase at the end of a period of 21 years after construction to pay for goodwill. There were two cases down for decision in which this point was involved—that of the "Edinburgh Street Tramways Company v. the Town Council of Edinburgh" and that of the "London Street Tramways Company v. the London County Council." In each case the referee appointed to determine the price that ought to be paid for the tramway undertaking which was about to be bought up did so by considering what sum it would cost to establish such a system of tramways if it did not already exist, and then deducting from that a certain amount in respect of depreciation. The companies, however, contended that the proper price ought to be arrived at by capitalising the rental value of their undertakings. The first division of the Scottish Court of Session dismissed this contention, and their judgment was now affirmed by a majority. The Queen's Bench Division, on the other hand, allowed the contention; but the order made for the award of the referee to be reconsidered was discharged some months ago by the Court of Appeal, whose decision was declared by a majority, as in the other case, to be in accordance with the statute, Lord Ashbourne alone dissenting.

In re James Smith.—An adjourned meeting for the examination of the debtor was held before Mr. Registrar Linklater on Wednesday. The debtor had traded as a potter in Lime-street, City, and at the Canal Potteries, Old Kent-road, under the style of "Thomas Smith and Co." The accounts filed showed gross liabilities £92,499, of which £52,310 were expected to rank, with assets estimated to produce £28,858. Debtor ascribed his insolvency to want of capital from the beginning of his trading, necessitating borrowing money at interest; but the Official Receiver, in his observations, said that it appeared to be mainly due to losses and liabilities on accommodation bills, loss on trading, and to the drawings for household and personal expenditure. At a former sitting, the debtor admitted that his accommodation-bill transactions during the twenty-five months preceding the date of the receiving order had amounted to no less a sum than £369,042. These transactions were carried on in connection with about twenty persons, who were mostly his customers, and, for the purpose of facilitating the discount of the bills, he opened five or six different banking accounts.—The examination was concluded.

CHIPS.

Sir Frederic Leighton was present at the reopening of the South London Fine Art Gallery on Wednesday evening, when the large cartoon, by F. Madox Brown, of the body of Harold brought to William the Conqueror, was on view for the first time since it was exhibited in Westminster Hall 50 years ago. The gallery will be open daily, 3 to 5 and 7 to 9.30 p.m.

The first walk of the archæological section of the Cardiff Naturalists' Society was held on Friday last, when the members visited the farmhouse at Llancaiach Vawr, the rectangular Roman camp at Gelligaer, and the parish church, which still contains the parish stocks in the tower chamber. The members returned to Cardiff by train from Hengoed.

The foundation-stone of the Central Board School at Millbrook, near Southampton, was laid last week. The building will be erected from designs by Mr. A. F. Gutteridge, of Portland-place, Southampton; the contract has been taken at £10,250 by Mr. H. Cawte, of Shirley. The school will accommodate 1,000 children in three departments.

A new organ, erected at a cost of £200, has been placed in the Congregational Chapel, Melksham. The inauguration took place on Wednesday week. The instrument has been built by Messrs. Samuel and Twyford, Dalston.

Fire broke out at Schofield's Timber Works, Oldham, on Sunday. The flames were subdued; but at night a fresh outbreak occurred, which was, however, extinguished. The damage amounts to several thousand pounds.

The Bishop of Winchester opened and dedicated on Friday a new chapel, which has been erected at Godalming at the expense of the Countess of Meath, for the use of the inmates of the Meath Home of Comfort for Epileptics—a home opened in 1892.

The city council of Birmingham decided, on Tuesday, after a discussion, to grant to Mr. J. W. Gray, the engineer of the water department, a retiring allowance of £600 a year.

Our Office Table.

An important and regrettable modification of Part V. of the London Streets and Buildings Bill was made by the House of Commons Select Committee, and has just been confirmed by the Select Committee of the House of Lords, now engaged in the consideration of the Bill. The original draft of section 55 in this Part V. of the Bill, had provided that in all future dwelling-houses an open space shall be left in the rear of each house defined by an angle of 45°, drawn from the ceiling of the ground floor. Under pressure from property owners, the House of Commons altered this clause so as to require an angle equal to 63·20° only, instead of 45°. Even this notable minimum of the clear space to be provided behind houses—one that will doubtless be treated as a maximum by grasping owners desirous of creating ground-rents, and their tools, the speculative builders—was opposed by the Associated Owners of Property; but after hearing evidence, the committee decided in favour of the principle of limiting open spaces by an angle of 63·20° "where practicable."

The preparations for the reception of the British Association at Oxford on Wednesday next, the 8th inst., are now fully advanced, and it is expected that there will be some 1,800 visitors in the University city during the coming week. The inaugural meeting will take place in the Sheldonian Theatre on Wednesday evening, when the Marquis of Salisbury will deliver his opening address. The second lecture, on Friday, will be delivered by Dr. J. W. Gregory, of the British Museum of Natural History, his topic being "Experiences and Prospects of African Exploration." The third evening lecture will be given on Monday week, the 13th inst., by Professor Shields Nicholson, of the University of Edinburgh, on "Historical Progress and Ideal Socialism." On the morning of Thursday next, the 9th inst., the presidents of the various sections will give their opening addresses. There are nine sections: (*a*) Mathematical and Physical Science, presided over by Professor A. W. Rücker; (*b*) Chemistry and Mineralogy, presided over by Professor H. B. Dixon; (*c*) Geology, presided over by Dr. Fletcher, F.R.S.; (*d*) Biology, presided over by Professor J. Bayley Balfour, of the Edinburgh University; (*e*) Geography, presided over by Captain W. J. L. Wharton; (*f*) Economic Science and Statistics, presided over by Professor C. F. Bastable; (*g*) Mechanical Science, presided over by A. B. W. Kennedy; (*h*) Anthropology, presided over by Sir W. H. Flower; and (*i*) Physiology, presided over by Professor E. A. Schafer.

Mr. A. Fowell Buxton has presented to the National Gallery a "Portrait of a Lady," by Jan A. Van Ravesteijn, a Dutch artist (born in 1572 and died in 1657) previously unrepresented in the collection. The picture, which has been numbered 1423, and hung on the second screen in Room XII., that containing the Peel collection, measures 19in. wide by 26in. high. The portrait is a three-quarter length of an elderly woman, with dark blue eyes; she looks to the left, and she wears a close-fitting black bonnet and dress, silver and pearl earrings, and a deep white cape.

The ultimate extension of the British Musenm by the gradual absorption, as the leases now held from the Duke of Bedford fall in, of the 69 houses and their gardens now abutting on the rear and sides of that institution in Montague-street, Charlotte-street, and Montague-place, may now be looked upon as assured, as the Bill for the acquisition of the land has successfully passed through the House of Commons, and was read a second time without opposition in the House of Lords on Tuesday night. The Museum will eventually cover the entire parallelogram inclosed by Great Russell-street and the three thoroughfares already named. About five acres will be added to the immense area covered by the Museum, and the sum to be paid by the Government for the reversion is £200,000.

To the north of Jerusalem, not far from the Church of St. Stephens, the owner of some ground has, in digging the foundations of a house, discovered a very beautiful mosaic pavement. Mr. Bliss, who has recently commenced explorations for the Palestine Fund, describes it as "a splendid piece of work, measuring about 21ft. by 13ft. . . . Within a beautiful border. . . . is a vine with branches on which hang clusters of grapes, and among the branches are numerous birds—peacocks, ducks, storks, an eagle, a partridge, a parrot in a cage, &c. It is almost perfectly preserved, and near the eastern end is an Armenian inscription to the effect that the place was in memory of all those Armenians whose names the Lord knows." Underneath is a cavern in which were found bones, lamps, and glass vases.

In the early morning of Sunday last the fine old church tower of St. Mary, Norton-sub-Hamdon, was struck by lightning. The whole of the inside, consisting of a peal of five bells, the clock, the chimes, with all the wood and lead work, were in a short time destroyed by fire. This church and tower are well known to those who have taken much interest in Somerset churches. It is almost unique as a village church in being of one style from tower to chancel, with the exception of the porch, which is about a hundred years earlier in date. The tower is nearly 100ft. high, and is a conspicuous object in the landscape, while the melody of the bells was familiar for some miles around. As a matter of course the walls of the building are of stone from the neighbouring quarries on the hill. These are all well built, and for all practical purposes are as sound as when the old builders laid down their tools. The inhabitants of the parish, as the custodians of the building, are most anxious that it shall be handed down to succeeding ages in as good a state as possible. The parishioners appeal earnestly, not only to their neighbours, but to all who love the old Somerset churches, for generous assistance, that they may be able to make good the fearful damage that has been done as far as possible, and so hand down the beautiful building a prized and valued possession to future generations. The Rev. A. G. Edwards is rector. Messrs. C. Trask and F. N. Quantock Shuldham are the churchwardens of the parish.

The annual report of the Department of Science and Art just issued shows a great advance in the number of schools and pupils under scientific instruction during the past year. The pupils in the science schools are not far short of 200,000, compared with less than half that number seven years ago. More than 110,000 of these students were examined in the year, and of these above half were successful in passing in one or more subjects. In the Art Division it is stated that more than two million scholars, in nearly 20,000 elementary schools, are now taught drawing, and are being examined, under the regulations of the department. Throughout the reports generally there are indications that the students in too many cases neglect to follow the rules and conditions under which they are required to work.

The general committee of the Cardiff Fine Art, Industrial, and Maritime Exhibition adopted, at a meeting on Monday, plans and suggestions for the construction of the proposed exhibition buildings, prepared by their architect, Mr. Edwin Seward, R.C.A., of Cardiff. There will be four chief ranges of buildings, forming courts (north and south, east and west), inclosing a central open court of 184ft. by 162ft. Around this there will be a promenade and covered-way gallery, space being thus afforded by which from 3,000 to 4,000 persons could witness the spectacles in the open court. In each case the buildings are set out to contain a central nave of 50ft. span, with side aisles of 15ft. width. The central portion of each court will also be provided with a gallery on the first floor. In the case of the fine art-department, which will form the central entrance front, brick will be employed; but the remainder of the buildings will be in corrugated iron. Italian, Dutch, and English gardens will be laid out on the south side, upon which opens the building devoted to the horticultural department. Here will also be displayed façades representing some of the features of Old Cardiff. These may be combined with a representation of the water-gate which stood near the rear of the Cardiff Town Hall, affording means of access to the Feeder, which will be utilised for water pageants. There will be an electric railway on the western side 2,500ft. long, and within this a switchback of 1,200ft. In the concert hall, space will be provided for audiences of about 2,000, and 200 in the orchestra; but the space can be extended to provide for 4,500 or 5,000 people. It was reported that the guarantee fund had reached £7,482. Mr. E. Seward was formally appointed as architect for the exhibition; his plans and estimate were accepted *nem. dis.*, and it was agreed that the works shall be carried out by contract.

The Court of the Carpenters' Company, in their report to the Livery, state that they have accomplished during the year what places them in the front rank of the City Guilds, especially in the promotion of technical education. The premises acquired by the Company in Great Tichfield-street, formerly the West London School of Art, are now called the Carpenters' Company Trades Training School, and the companies who have classes there for the teaching of their different trades are the Tylers and Bricklayers, Wheelwrights, Painter Stainers, Plasterers, and Masons. The Institute of British Wood Carvers occupy one end of the building. The number of students in all the classes since the commencement has been 140. The Company's educational work at Stratford offers every encouragement for increased effort, the various exhibitions having been of a very satisfactory character.

◆

The West Ham Board of Guardians have adopted plans prepared by their architect, Mr. Sturdy, for a proposed workhouse infirmary at Forest House. The estimated cost is £105,182.

On Tuesday week the Bishop of St. David performed the ceremony of reopening Penrice Church, which for the last twelve months has been undergoing restoration, at the cost of £1,000. The work has been carried out by Messrs. Beynon and Gibbs, of Gower, from the designs of Messrs. Waller and Son, of Gloucester.

Several additions have been made quite lately to the chapel of Stonyhurst College, notably a panelled and carved oak dado, 10ft. high, made by Messrs. Robson and Sons, of Newcastle, and an alabaster altar by Messrs. Boulton and Sons, of Cheltenham. Mr. Hedley, of Newcastle, fixed, in time for the centenary, a carved oak reredos; the panels are filled by paintings by Messrs. Bacon Bros., of London. Messrs. Dunn and Hansom, of Newcastle, have been architects for all the work, and everything has been carried out from their designs and under their superintendence.

Trade News.

WAGES MOVEMENTS.

South Shields.—The Master Builders' Association of South Shields has conceded an advance of ½d. per hour for joiners and machinists, and this new rule came into operation on Wednesday. The North Shields builders have accepted a like advance, and the threatened dispute has thus been averted.

CHIPS.

A new church is about to be built for the parish of St. Lawrance, Barton, adjoining the present church, which will, on the completion of the new edifice, be pulled down. The monuments will be transferred to the new building, the stone from the old church will be utilised for boundary walls to the churchyard, and the woodwork for panelling in the new church.

The little parish church of St. Peter's at Hever, Kent, has recently undergone a thorough and much-needed restoration. The work has been carried out by Mr. W. H. Bourne, of Woodchurch, Kent, under the superintendence of Mr. R. Philip Day, the diocesan architect. The cost has been between £1,300 and £1,400.

The dedication of the twelve clerestory windows of the parish church at Kidderminster, which have been filled with stained glass as a memorial of the late Bishop Claughton, took place on Friday. The windows are illustrative of the Benedicite, and and they have been designed and executed by Messrs. Hardman, Powell, and Co., Birmingham.

HAM HILL STONE.
The attention of Architects is specially invited to the Durability and beautiful Colour of this material.
Quarries Well Opened; Quick Despatch Guaranteed; Stonework Delivered and Fixed Complete. Samples and Estimates Free.
Address:—
THE HAM HILL STONE COMPANY,
NORTON, STOKE-UNDER-HAM, SOMERSET.
London Agent:—
Mr. E. A. WILLIAMS, 16, Craven-street, Strand, W.C.

AND ENGINEERING JOURNAL.
VOL. LXVII.—No. 2066.

FRIDAY, AUGUST 10, 1894.

COMMERCIAL DESIGN.

THOSE who can see a little further than most people cannot fail to discover a good deal of what may be called artistic slavery in the design of our buildings, our manufactures, and art goods. In every case there is something to be made by somebody. In the building of a house the ground landlord or leaseholder, or the speculative builder, makes a profit; the contractor for a public building has to recoup himself; the producer of manufactured articles looks for a remuneration on his capital, and the draughtsman has to be paid for his labour. When the owner gets his building, or the customer his article, a series of profits have been made; the building or article is primarily made to sell. The workman or tradesman obtains his profit, but only like a machine, not an intelligent being. Such a state of things is so general that when we see a building, a piece of furniture, or a wallpaper or carpet, we hardly can say who is responsible for the design, or how many profits have been made on it. It is no longer the product of the designer and workman with one object in view coming direct to the owner or customer. Many persons have had a hand in the production, one making a profit out of the manufacture, another something out of the sale.

Take the ordinary building—from first to last, somebody is trying to make something out of it. The contractor is endeavouring to cut down the brickwork or stonework here or the details there; the manufacturer or merchant seeks a profit by endeavouring to persuade the architect to use a material that is a little easier manufactured; the engineer or specialist to do only as much as he is obliged to do, to make the heating system or ventilation workable, and even the designer and draughtsman are more intent on exhibiting their artistic talents on paper than in the building. If we seek to explain the reason of all this, we must come to the only conclusion—the great hiatus between capital and labour, or between the designer and the workman. The social and industrial condition of the producer lies at the bottom. The workman is cut off from the employer, the producer from the consumer; each seeks to make his own individual profit at the cost of the other. Thus, in the design of carpets and wall-papers and metal goods, the public or individual customer has really to deal with the manufacturer second or third hand, whose taste is stamped on the articles produced and sent into the market, and the dealer or salesman has also a voice in deciding which is to be sold.

A good deal of artistic slavery is engendered by the method of working now in use. Do we not see it amongst our artisans and artists in the production of furniture, joinery for buildings, metalwork decoration, and textiles? Subdivision of labour reduces the workman to a unit, disconnected from his trade as a whole, and all other trades. The professional designer now takes the place of the various crafts; he designs for them. One writer, speaking on the bearing of subdivision of labour on the teaching of design, says truly: "How are we to teach design, technique, and style, in its direct application to material when the pupil has no chance of coming into contact with the whole of his material; when one portion of it is made in Birmingham, another in London, another in New York?" One consequence of this breaking up of the work into fragments is that the designer becomes a mere professional hack; if he draws a piece of furniture or metalwork, he puts a quantity of unnecessary labour into it; his design is a model of finished execution; the drawing is shaded by lines which take him a longer time to perform than the original thought bestowed upon the design—labour thrown away, but which ought to have been expended in the workshop. The consequence to the workman is that he ceases to take any personal interest in a work, and endeavours to frustrate the intentions of the designer. We refer more especially now to the ill consequence, on the designer, which the system in vogue at South Kensington has encouraged in its application of art to industry. By placing design in the hands of a class, instead of encouraging each craftsman to become an artist in the material in which he works, a kind of fictitious draughtsmanship is promoted which goes under the name of design. The very repetition of drawing designs on paper without knowing or touching the material creates a conventional system of designing. The artist gets into a groove of his own. His designs for tiles, pottery, mosaic floors, wall hangings, ironwork betray a certain "set" of thought or mannerism, which gets more and more hard and stereotyped the longer he designs. The artistic specialist cannot see new problems, for he is never brought into contact with the actual manipulation or processes of the potter, the mosaic-worker, the forge, or workshop. Many of the designs which this year are exhibited at South Kensington Museum in the various classes of the department show unerringly this tendency. The art school teaching simply inculcates general principles and rules, and places examples before the student. These are no doubt good and excellent, but they do not enable the pupil to think out the conditions and problems for himself as they arise. A want of knowledge of the real conditions of the material or structure is betrayed by the authors for designs for tiles and pottery, wall-papers and textiles. Thus, for example, we notice in some designs a want of insight into the requirements of the process of tile-making. The pencil or brush appears to be out of sympathy with the material and its mode of working; the very lines and choice of patterns and shading betray the ignorance of the student with clay-working and burning. In the designs for pottery the examiners make a remark which applies generally to other classes as well. They say the students in many cases "appear to be misled by pleasant effects of ordinary water-colour, which could not be rendered in pottery." This is true both in tiles and plaques. A particular effect of colour and shading is sought which cannot be produced. In the textile designs we discover a similar want of sympathy with the structure or fabric. The printed hangings and other designs are either too elaborate or unsuited for printing; carpet designs exhibit often a want of knowledge of the manufacture, or, at least, of the proper treatment of forms, or the patterns are those which have been used before. The drawing in every case is excellent, and a degree of perfection in getting up these designs on paper is attained which does not accord with the practical knowledge of the designer. In fact, in carpet design, as in every other artistic manufacture, the manufacturer has to cater for a much lower public taste than even he desires. The manufacturer often has to keep his personal taste to himself, and to produce patterns and colours which violate every canon of good taste, and the designer must equally meet the want. So long as we have this condition of things to study it is impossible to expect a higher standard of design. Again, to produce at moderate price, mechanical repetition is a necessity; large quantities of each design have to be made. The present mode of introducing these designs to the public tells also against the system in vogue. The manufacturer often forces his own taste on the market, and the public can only buy what the dealer or salesman likes to bring forward. With regard to the pattern-book mode of introduction, those capable of judging know very well that the best goods and designs are shown to a great disadvantage, the result being that the vulgarest designs are bought. As to carpets, the Persian or Eastern examples afford the best schooling probably for the designer. Whatever value there is in geometrical distribution of a pattern, it does not follow that it should be obtrusive. Certainly there should be some indication of design, or it becomes a bewildering jumble to the eye.

But these indications of mannerism, fostered by the system of copyism or design which is promoted in our art schools, do not apply to one branch only, but to all. In the architectural drawings and designs, the examiners have called attention to particular points "to the absurd waste of time and pains in mere mechanical processes and idle repetition." We find this a common failing of much of the modern design. All the reproductive processes which are favoured by our industrial system encourage mechanical repetition. The draughtsman likes repetition, because he obtains effect with a small expenditure of mental effort; the contractor likes it, because it saves labour, and machinery can accomplish the work quicker; the bricklayer, mason, carpenter, plasterer, and decorator all like it, because they can repeat one detail a hundred times over. The architectural draughtsman, or the designer of furniture, metal-work, and pottery in a particular sense exemplifies the working of the modern commercial system. His method is to make pleasing designs on paper; but as these have to satisfy chiefly the employer or manufacturer who requires a large percentage of profit, repetition and mechanical labour are required. He spends his time in repeating details, by shading his drawing by "hatching," or ruled lines, and produces rather a taking picture than a well thought-out design. What a waste of time is seen in elevations or sections shaded by lines, which time might have been saved by a wash of sepia or India ink. In another place we find a school of art students, pretending to show the joints of masonry in a measured drawing, but which lines are merely put in to produce an effect of neatness without any regard to accuracy. Far better, as the examiners say, not to show the jointing. Another hint is given as to the value of explanatory sketches in drawings. Our old masters and our greatest designers have left us instances of their original designs in which these rough explanatory sketches are shown in the margin; and of drawings roughly shaded in pencil, crayon, or brown wash. They made no attempts to produce neat or pretty drawings. No; these old workers were too busy or too nearly in contact with the real materials or buildings to waste their time in repetition of a detail or the mechanical shading of a cornice.

In every field of artistic design there is someone to make a profit. Sometimes the business and commission-taking architect does it at the cost of his clever draughtsman who wins him his competition; sometimes the manufacturer or producer makes it out of the designer or artist of the establishment, who is paid a pitiable salary; sometimes it is the enterprising contractor who places himself between the employer and actual worker. Whichever it is, his training and education is to make attractive drawings on paper apart from, and independent of, all consideration as to material or structure. We have both the "individualist" and "collectivist" systems of industry, the modern "commercial," and the old guild or workshop system, set before us by example and precept; we know what each has done and can do, and it remains with us to adopt that which will give the highest results.

HYGIENIC DEVELOPMENTS IN BUILDING.

TWO or three valuable papers which we reported last week read at the Public Health Congress deal with matters of sufficient importance to call for remark. Cardinal Vaughan, in referring to the housing of the working classes, pointed to the advantage of the cottage system as against that of the "block" system of building, as being more favourable to the home influence and the bringing up of children. On this ground he thought the "outward extension" into the country of cottages was to be preferred to crowding together masses of people under one roof in a busy centre—a plan with which everyone will agree who has considered the problems. No doubt the railway companies along their lines might utilise their land to build and manage cottage towns and provide cheap fares, for many tracts of ground lying waste and profitless at the side of railway junctions could be rendered profitable in this way.

The subject of Architecture and Hygiene of Schools was ably dealt with by Mr. Thomas J. Bailey, F.R.I.B.A. The author's practical knowledge with the requirements of Board schools in London will be read with interest. School Board architecture is one of the modern developments of our day. Its germ is to be traced back to the old elementary school, and to the old Code. Undoubtedly a great change has been made; various modifications have taken place in the plan of schools since the first Board school was built 21 years ago. The first schools built generally had, as Mr. Bailey showed, a long central room with one or two classrooms at each end, the central room forming a passage-room to the classrooms, with desks along the back wall, in which the windows were placed. This central passage-room sort of arrangement had many defects. The room was filled half with desks, and the light was in the teachers' eyes, while the free or passage side of the room was crowded with teachers' desks and apparatus. The want of access to the classrooms, and the division of the main room for classes, were the chief defects in this plan; and to avoid the inconvenience of having to traverse the central room, a corridor or corridors were introduced along the side to give access to the classrooms. This passage was made wider and wider, until the "hall" was evolved with its independent classrooms side-lighted opening into the hall or corridor on one or both sides. It is interesting to notice the several changes as they are described by Mr. Bailey—stages really in the evolution of the modern typical Board school. They are a series of modifications suggested by actual experience in planning which have entirely altered the original type of building. The central hall, with its groups of separate classrooms, is the main difference, the cloak-rooms and entrances have also been gradually provided for, and have grown, so to speak, out of the widening of the corridor. The "model" plan illustrated in the old Code has so completely given way to the new type that the Department would condemn any plan founded on the old arrangement. The sanitary requirements have also undergone a complete change. Playground area has been increased to a minimum of 30sq.ft. for each child. The old latrine provision of closets outside the school, with sometimes covered passageways to the school, has been improved, and automatic flushing-tanks and stoneware troughs substituted for the defective iron troughs. The Hugh Myddelton School, Clerkenwell, is an example of the modern type of school and sanitary arrangements. Here we find all the points to which reference has been made—a main school of three stories, infants on the ground-floor, allowing 8ft. superficial to each child, 10 classrooms for 75 to 80, and a central hall, 80ft. by 40ft. The upper-floor classrooms are for 60, and there are four staircases, the boys being at the top. Warming is provided for by low-pressure steam, with ventilating radiators. Inlets for fresh air and extractors from the ceiling level insure a renewal of the air and prevent stagnation. Cloak-rooms are warmed by steam-pipes, and well ventilated—a very desirable thing when damp garments are hung up. Drawing classes are now a necessary adjunct, and these are provided for on the top floor over the classrooms at one end, and a manual training workshop at the other, though the latter may be better placed in the playground for boys. If there is a chemical laboratory, a position on the upper floor is a good one. No doubt other changes will be adopted to meet the requirements of education as time goes on, but we may take this school as embodying the main points of the improved Code.

The paper on Fever Hospitals, by Mr. Campbell Douglas, F.R.I.B.A., did not throw much fresh light on the question of planning. Two points broached by the author are worth remembering; one is that the most costly hospital was not necessarily the most efficient, and the other that the most effective and modern plan does not always show the best results. The comparison of two hospitals, the Belvedere Hospital, Glasgow, with the City Fever Hospital, Edinburgh, the former with double pavilion one-story wards, and the latter with three stories, was instanced, where the lowest death-rate occurred in the latter, old-fashioned, antiquated city hospital. An allowance per bed of 2,000c.ft. is recommended, a capacity which is perhaps not often found. Among other things the author recommended double-hung windows, an open air under-story below the ward blocks, both of which are now accepted necessaries to insure comfort and health.

On the question of local sanitary authorities, Mr. Lewis Solomon's paper dwelt on many of the difficulties and troubles experienced by the architect in carrying out sanitary work in London. We have repeatedly drawn attention to the irregular practices of sanitary authorities, and their want of a uniform code of rules. For plans of drainage, one authority requires one scale, another a different one; one parish requires the position of closets on each floor to be shown, another does not. By one authority a 9in. drain-pipe is necessary, others are satisfied with 6in. pipes; the rule about laying pipes in concrete under the house is not universally enforced as it ought to be. Some parishes require the pipe to be laid on or half buried in concrete; other parishes require them to be entirely bedded in that material, a diversity that may be observed in many recently built estates. The necessity of having an inspection chamber is equally uncertain in its enforcement. One parish requires it in front; others both behind and in front of the house. Some approve of air inlets to the drains; others do not, and there seems to be a great difference of opinion as to where the outlet ventilator is to be, and of what diameter it should be. In some parishes special types of closet apparatus are required. Testing drains is another matter about which the parish surveyors and inspectors have their own whims. All these things, as well as sanitary certificates being granted before the tenant goes into a house, should be regulated on some uniform basis. At the present time each parish has its own likings; the authorities and their surveyors exercise their powers sometimes indifferently, at other times absolutely, and the architect is either bound to submit or his client be fined.

OF CHURCH EMBROIDERY.—XII.

By May Morris.

DESIGN.

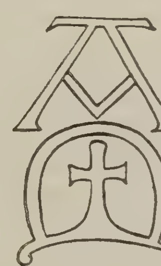
[WITH LITHOGRAPHIC ILLUSTRATIONS.]

I AM lingering a little over Mediæval art, and the illustration that accompanies these notes is again an example of woven stuff, a scrap of fine Italian work with birds and dogs, both very life-like. I hope you will be as pleased with this beautifully harmonious treatment of living everyday nature as I am; but I am sorry that the scrap of stuff is not large enough to give all the repeat of the pattern. Of course I have not said my say about animals and symbolism, but I do not fancy you would care to have me wander very far off the beaten track of embroidery into the realms of archaic worship, and all the strange beliefs enveloping the mysteries of the world's origin, that gave birth to so much of what is familiar to us in decorative art.

The fact is, I do not sympathise with those early Christian writers who, recognising the analogy between their own and pre-Christian religions, feel bound to make explanations, often far-fetched and mystic, for that analogy, and sometimes in the process weaken the vividness and reality of the ancient belief. It is no use trying to give some deep esoteric meaning to all animal symbolism that has come into the Christian religion when its own meaning is perfectly clear and indisputable as to origin. It is the old, old illogical method of explaining an ancient custom by tacking a more modern and often mythical story on to it. What harm if the Byzantine peacock, the sacrificial lamb, the dove of the Trinity, all find their prototyes in early religions? The often-quoted analogy between Orpheus making music to all created animals, and Christ as the Good Shepherd, does not come amiss to my mind, for in both we have represented the same idea of universality, of communion with, and protection of, all living things. The Roman Catholic symbolists, in writing on colour, and on the sacred numbers, become extremely fantastic and interesting also; and here I will say that modern symbolism, already traditional, shows a tendency to become more and more arbitrarily mystical, and should be treated by designers for ecclesiastical decoration with caution and judgment. It would be as well to use only the more familir emblems and symbols, and to allow oneself the same latitude in interpretation that the old artists were allowed. There is often a baldness and poverty about symbolism introduced into modern design, which I account for by the propensity, a mistaken one, I think, to treat such forms too simply, and without sufficient regard to decorative effect. A quatrefoil placed in the centre of an altar-cloth, and unsupported by any floriation or minor work, is dull enough, ornamentally speaking; but interlaced with other forms, or relieved by less-pronounced constructive lines, it becomes pleasing and interesting, and thus treated is one of the most familiar forms in design of the best periods. Banish rustic crosses, lumpy crowns, realistic nails in the passion emblems, and that ugly thing, the Passion-flower, that has not even the merit of antiquity, and reminds the profane mind of nothing more exalted than a neat suburban garden with its crude brick wall.

I know that very little latitude is permissible in the modern church with regard to colour, the symbolism being rigorously adhered to, sometimes at the expense of decorative effect. Easter vestments must, I believe, be entirely white and gold; blue is, as a canonical colour, rarely admissible, in England, at least, and so forth. Early vestments had more variety in their colouring; to go no further than an old church inventory, we find among the possessions of the cathedral of Lincoln, "Item, 13 copes of the same suit (*i.e.*, white damask), with orphreys of blue velvet, figured with flowers of gold." Again, "Item, a cope of white damask broidered with flowers of gold with a red orphrey, having in the Morse this scripture, 'Memoriale Domini Willielmi Fendike quondam Vice-cancellarii hujus Ecclesiæ,' in the hood a bird of gold called a Fanshe." I wish I could believe in the existence in the Zoological Gardens of the bird called a Faushe, or Fanshe; but I fear it is unfindable, and the nearest I can get to the name is that of the respectable and historic phœnix. But, again, it may be a finch (*fauchet*). However, I will spare you a parenthetical dissertation on etymology, a subject of which I am entirely ignorant, and therefore cheerfully ready to write upon. Plenty of blue vestments and church hangings are to be met with in the same rich inventories of Lincoln:—"Item, another cope of blew baudkyn, having a branch of white roses, running in red velvet in the midst of the orphrey, and a spleyed eagle in the hood." "Item, a canapye of blue cloth of Baudekyn with buds of flours in gold." "Item, a canapye of red silke, with green braunchys and white flours poudyrd with swannys of golde between the branchys." Note what a fine eye for colour and composition the writer of this inventory has, and how skilfully he places before us in a few words the hanging, with its golden swans between the blossoming trees.

If one goes in for symbolism of colour to a great extent in ecclesiastical or secular decorative art, one comes upon unexpected embarrassments owing to the ambiguity of the symbolism itself. It has often come into my day's work to arrange and design covers for this and that book, with the behest laid upon me to get as much of the solid contents of the work into my few poor little inches of plane surface as ingenuity or conscience will permit. Sometimes I do it; sometimes I strike; sometimes, when I have a little time to spare and a particularly charming and reasonable woman to deal with, I explain, with all the clumsiness of the inarticulate artist, why and when rigid symbolism is not possible or desirable. If you put the copy of "Tristan and Isolde" that you followed the opera with at Bayreuth into a green cover to recall Isolde's Irish birthplace, you find yourself wishing you had made it red, to express the passion of the story. Green, too, I find, on consulting an authority, denotes "youth, mirth, and gladness, and is emblematic of felicity and prosperity," which is rather a large order, and not descriptive of the fate of these lovers. Now, let me go further, and bring you to the reduction to absurdity of modern symbolism. A leaflet before me, headed "Picture-Poems in Porcelain," explains that a certain firm are desirous of giving to the eager world both pictures and poetry in bedroom furniture (to lighten the heavy sameness of our morning and evening toilette), and you are invited to go and view the results of their public-spirited efforts in a room decorated by an "elegant scheme of plush and silk drapery . . . . the ceiling being hidden by an arrangement of light blue silk, so disposed as to create a sky-like effect." Now this is very promising, and you read on, hoping for more. Then you find that one suit of bedroom furniture (consisting of "washstand and dressing-table, with adjuncts") is made to illustrate the story of Lancelot and Elaine; another Faust, a third Marmion, a fourth the Marriage of the Roses. I must quote, for it is too good to be lost. We have, first, Elaine watching Lancelot and Lavaine; next the hermit's cave at Camelot, with Lancelot lying on a couch and Elaine bringing him the diamond prize; next King Arthur, surrounded by the Knights of the Round Table; next, Elaine confessing her love to Lancelot; next, Elaine witnessing the departure of Lancelot; and elsewhere Elaine sitting alone in her tower, Elaine on her death-bed (with her family and friends around her), Elaine laid out in state on her barge, and, lastly, King Arthur reading Elaine's last will and testament." Please remark what follows: "It will be noted that in every instance flowers take the place of figures, Elaine being represented by a moss rose on a golden stem, Lancelot by a yellow Marshal O'Neil rose on a golden stem, Lavaine by a red English rose, King Arthur by an English rose on a golden stem, with purple and ermine leaves, and so forth." In Faust, we are told, Margaret is a daisy, Faust a pink poppy, Mephisto a red orchid, and Martha a jonquil. "The incidents are well-chosen and picturesquely treated. The ewers and basins are decorated with passages from the score of Gounod's opera, in which the clefs are formed variously of a spider's web, the scabious flower, the orange-blossom flower, and the lilium auratum; and the notes by flies, seeds, orange-blossom buds, and lilium auratum buds." We find that all the exhibits are "delicately imaginative in artistic treatment," "unique," be it observed, "and not destined for exact reproduction." Now I leave Mr. X. (for this is not an advertisement) and his sky-blue silk ceiling, his toilette-table and adjuncts, his symbolism gone mad, and set up my wail of wonderment that a moderately-sane world will encourage such tomfoolery by paying for it in hard cash. Endless is the information to be got out of the writers on symbolism with regard to the sacred properties of numbers. I spare you the quotations I should like to make; but treatises on this subject are excellent reading. On the sacred names, too, there is ample room for mystic symbolism. In the name of the Virgin Mary, some old writers take each letter for an initial: one finds five precious stones in it—M margarita, A adamas, R rubinus, I jaspus, A amethistus; and another finds the qualifying titles of the Virgin—Mediatrix, Auxiliatrix, Reparatrix, Illuminatrix, Advocata. The monogram, giving the first and the last letters of Maria, is sometimes very prettily worked out (as in the accompanying sketch, 13th century). The insertion of these monograms, or the names or initials of the personages represented, give a distinctive character and special interest to figure design, and any motto or legend, clearly and sharply drawn and worked, strikes an important note in the scheme of such design. I need not say that modern eyes will scarcely trouble to decipher them, but that must not deter the designer from using all the decorative resources of his invention; for, unfortunately, artists are bound to work for themselves rather than for their audience to-day, which is just exactly what makes the difference between old and new work. Some years ago I exhibited a pair of embroidered curtains, which were crowned by a couple of verses; very clear Italian lettering, worked in black on a white ground. I shall never forget those verses. I spent the greater part of two days in repeating them to the ladies who came to see the work, and who went away vaguely charmed, asking me out of politeness what the words were, and listening out of sheer good nature and politeness while I recited those weary lines. Nevertheless, I shall continue to put legends and scriptures in my designs when it seems good to me, and pigeons, and cocks and hens, and puppies, and "faushes," and little black pigs, too, if I like. The brutality of the artist who does not care for his public (and only for his critic as far as he prepares the market for him) is the outcome, on the one side, of that irritating divorce of art from common life which, on the other, creates the very indifference of the untrained eye and mind which artists complain of. What a circle of cause and effect! And poor Art, to be so tossed!



Does it ever strike you, by the bye, how ludicrous that word "art" would sound on the lips of a mediæval workman, who was steeped in art to the marrow of his bones? To distinguish between objects of everyday life and objects for use on state occasions would not come amiss to him—the one simple and homely in material and work, the other wrought with becoming magnificence, but both sightly. But the "art-object" to-day knows its place, and stays there. The rickety little table from an artistic shop may be as cheap and nasty as your kitchen table; but your kitchen table would not venture into the drawing-room, and your black-and-gold gimcrack on its three uncertain legs bristles with gentility, and is innocent of "utility-value."

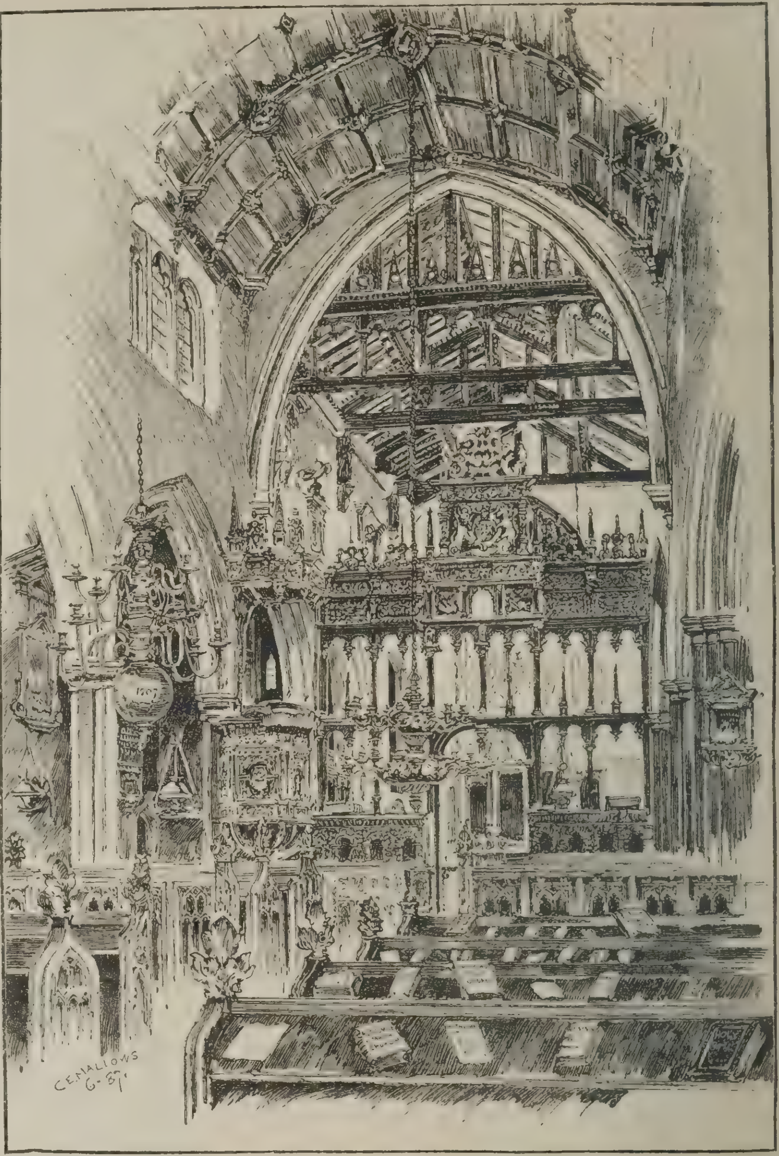
THE ARCHITECTURAL ASSOCIATION EXCURSION, 1894.—I.

[WITH LITHOGRAPHIC ILLUSTRATIONS.]

THE twenty-fifth annual excursion of the Architectural Association will commence proceedings on Monday next, the 13th inst., at Wells, under the personal direction of the President, Mr. E. W. Mountford, F.R.I.B.A., and the following abstract is the text of the official programme:—On Monday, Crosscombe Church will consume three hours, and Chewton Mendip Church has two and a half hours devoted to it. Tuesday will be entirely occupied in visiting and sketching in the Cathedral, the Bishop's Palace, the Deanery, Vicar's Close, St. Cuthbert's Church, and the Bubwith Alms-houses at Wells. On Wednesday four and a half hours will be spent at Mells, at the Church and Manor-house, with one hour on the return journey at Shepton Mallet. Thursday, a trip into Wiltshire by train will be made to see Longleat and Stourhead, three hours being devoted to the Marquis of Bath's Mansion, and half that time will be spent at the other house. The journey this day rather looks as if it would be a tiring one. Friday will be divided between Pilton, Evercreech, and Bruton; and Saturday morning will be spent at Glastonbury. From this list it will be noted that only ten places besides the cathedral city are to be visited, at once affording a striking contrast to the programme of the first Somersetshire excursion held by the Association in 1879, when no less than twenty places were seen, exclusive of Wells itself, which then, as now, furnished the headquarters of the party. These places were Crosscombe, Shepton Mallet, Doulting, West Cranmore, Nunney Castle, and Mells, Priddy, Cheddar, Axbridge, Rodney Stoke, Westbury, and Wookey. Pilton, Pylle, Ditcheat, Wyke-Champflower, Bruton, and Evercreech, ending with Glastonbury and Meare. The buildings commanding attention in Wells itself occupied Monday as well as the morning of Saturday on that occasion, which has by common consent been generally accounted the most enjoyable excursion of the entire series. The late Mr. J. D. Sedding, it may be mentioned, first took part in these outings that year. Two other excursions, besides the Wells outing, have since been held in the same county—viz., that at Yeovil in 1883, when Mr. Cole A. Adams was President, and that at Taunton in 1892, the year of Mr. H. O. Cresswell's presidency. Mr. S. Flint Clarkson held office when the party first visited Somersetshire, the architecture of which county is fairly well familiar now to those who joined all three of these trips, to say nothing of the Bath Excursion, when the northern borders of the county were to some extent encroached upon. The inevitable difficulty, which by the very nature of things has proved almost insurmountable, of selecting fresh districts sufficiently limited in area, and at the same time well furnished enough with typical and interesting examples of architectural merit to be worthy of so continuous an examination as these excursions necessitate, rendered it desirable to go over again some of the earlier ground already covered by a few of the earlier excursions, and thus it has come about that Wells has for the second time been chosen. Last year the Norfolk and Suffolk programme was, to some extent, spoiled by the further difficulty of securing suitable hotel accommodation for so numerous a party. This year the original hospitable headquarters of the Swan, facing the grand west front of the noble cathedral at Wells, will, if we may judge by previous experience in the same hostelry, leave very little to be desired. The tendency of overcrowding the programme with minor specimens of work previously complained of on some of these trips has been rigidly avoided—at any rate, this year. Indeed, we should not be surprised to learn that an approach to the opposite extreme has been brought within a measurable distance, with provisions such as the three hours' stay at Crosscombe, where the tower and spire and the very rich Jacobean screen and pulpit are the chief attractions. The four-and-a-half hours' stay at Mells, the seat of the Horners, near Frome, is a liberal allowance, although the place is a most delightful spot unquestionably, with a highly-interesting church, distinguished by a handsomely-proportioned and typically-characteristic western tower, which, like the interior of the building, has been well, if not too thoroughly, restored, as some may think, the Renaissance pewing*, which once so greatly enhanced the interior, having for one thing been cut up and reused as a dado. Mells Manor House, a sketch of which figures among our lithographic plates to-day, adjoins the church, with which it groups uncommonly well; but interesting as its history is in association with the well-known tale about the veritable "Jack Horner who sat in the corner," the building is, after all, soon seen and easily remembered, with its simple detail both inside as well as out. In 1879, only forty-five minutes were allowed, which was, of course, far too short a stay, even if the time arranged for is none too long on the present occasion. Although Glastonbury is included, Adam de Sodney's 14th-century house at Meare, and the "Fish House" hard by, are omitted. To visit Glastonbury and not see these buildings seems strange indeed. Longleat, it is true, has not before been visited on either of the A.A. excursions, and no doubt for its "pure" Elizabethan detail and dignified semi-Italian design it certainly justifies a digressive ramble by a body of architects, for

With every luxury complete,
All charms the senses at Longleat.
Nothing is wanting, all complete;
Perfection's Empire is Longleat.

Traditionally, John of Padua's name has been associated with the house, and we know from the existing documents that Robert Smythson (the "surveyor" of Wollaton) was some while head mason here; also that Sir Christopher Wren erected a staircase and porch, which Jeffrey Wyatt pulled down when he built the north front, and did his best to spoil the inside of the mansion. Mr. J. D. Crace has decorated the place during the last 20 years, and unquestionably the building is of the first consequence, to say nothing of the art treasures housed within its walls, which date from 1566.† We are not so sure about the Classic mansion known as Stourhead, the seat of the Hoare family. The central portion of this mansion was built in 1720 from the plans of Colin Campbell, the Scotchman who designed Houghton Hall, in Norfolk (seen on the King's Lynn excursion), and built the front of old Burlington House, Goodwood House, near Chichester, and other similar mansions in Kent and elsewhere. There are probably still some fine pictures and other art treasures in this house, collected by the late Sir R. Colt Hoare about 100 years ago; but the "Gothic men" of the party, if any such worthies still exist, will be little likely to become enthusiastic over its architecture. The accompanying illustration gives the principal front view of the building, the wings of which were added in 1800. Its "pleasure gardens" and charming grounds,



CROSSCOMBE CHURCH, SOMERSET.

with the extensive lake of 30 acres, "embosomed in wooded hills, which open as if to show the distant vistas ascending through the park," furnish a picture of unquestionable merit and exquisite beauty. These two houses furnish the only variations in the way of additions to the programme of 1879, excepting Chewton Mendip church; but among the omissions which can but cause regret is the grand ride to Cheddar over the Mendip Hills, though we are bound to admit that the buildings to be seen along the route are not of leading importance architecturally speaking.

So much for the general outline of the forthcoming proceedings, and, without any aim at even an epitome of the history of the architectural beauties of Wells, which is beyond question one of the most interesting cities in Europe, we may briefly direct attention, by a few descriptive and illustrated notes, to some of the buildings which the excursionists will see on this occasion. Among our accompanying sketches to-day is a charmingly-drawn pencil view of the Common Hall, or Library, as it is now sometimes called, of the Vicar's Close, contributed by Mr. C. E. Mallows, who, we are glad to be enabled to say, is recovering from his late serious illness. The view represents the fireplace and recessed windows on either side of it, with the reader's pulpit within the thickness of the wall over against the chimneypiece. Mr. Thomas MacLaren has lent us his capital sketch showing the chain gate and Vicar's Close entrance archway, over which this common hall is located, and the chimney with the main windows, as well as the little ones at the rear of the pulpit, represented in the picture. From the Cathedral we have Mr. Mallows' study of St. Toothache's pillar, seen in his sketch in the south transept, looking into the nave. The authority for the legend is that the faithful, resorting to this spot when suffering from the agonies of this painful disorder, were relieved after patient reflection and undoubting prayer, standing in front of the column on the tomb slab in the floor and there meditating upon the sculptured representation, seen incorporated in the pier's capital, of a man's head depicted in the throes of a toothache. Hence the local term of "the Toothache Column," and we gather that Canon Church is quoted as the authority for the picturesque legend. The plan of the cathedral, printed among our block illustrations herewith, will enable the reader to see the exact position of this column. Evercreech Tower, sketched by Mr. MacLaren, completes the plate. The interior of Crosscombe Church, drawn by Mr. Mallows, is taken, by the permission of Messrs. Cassell and Co., from the *Magazine of Art*, showing the celebrated pulpit and screen, of which we published fully-drawn-out details by Mr. Arthur Ed. Bartlett on July 26 and on Sept. 27, 1889. Our last sheet to-day includes two sketches from Glastonbury of "the Tribunal" in the High-street, and the celebrated Abbot's Kitchen, with a plan showing the four fireplaces, one in each angle, and flues running straight up; but the chimney tops which rose above the corners were demolished a long while since. The sectional diagram embodied in the text further elucidates the sketch of this curious structure.

In reviewing all these estimable examples of a bygone age, the two distinct studies, which on the one hand include the practical architect's estimate of them as specimens of design and construction, and on the other embrace historical and archæological considerations, present the same

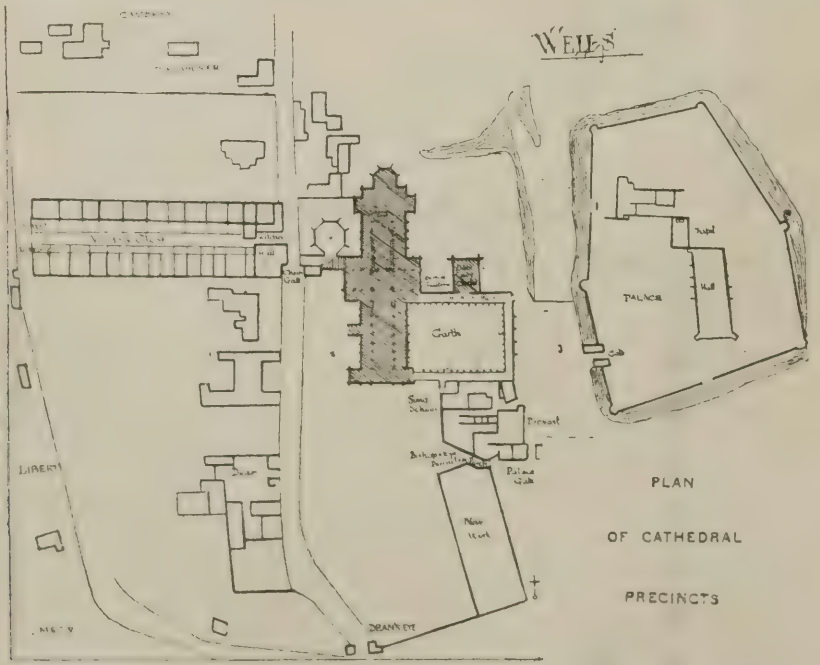
subjects from different standpoints, and yet leave neither complete without the other, for, in fact, they cannot actually be separated. The city of Wells, with its unique group of ecclesiastical and secular buildings, particularly demonstrates the inseparable character of both studies in which architecture and history join hands. The buildings of Wells were not monastic at all, and therefore all the essential features of a conventual character, such as a refectory and common rooms with dormitory cells, are absent. The clergy were parochial, and these seculars, being parish priests, were governed by the bishop, and they occupied separate houses, with different individual duties. The Chapter of Canons administered the Diocesan property in conjunction with the bishop, and had no ordinary obligations of a monkish rule to obey. Naturally there were here, as elsewhere, serious engagements between the Cathedral clergy and the Abbots of Glastonbury; but these struggles were practically at an end ere the present buildings were begun, and the monastic houses once existing in Wells were before then destroyed. A very comprehensive plan of this cathedral, with its precincts complete, will be found among our block illustrations to-day, showing the Bishop's Palace, the Vicar's Close, &c. The monks of Glastonbury had to give up to the Cathedral Chapter several manors, which were ceded to Bishop Joceline and his successors for ever, and in addition they supplied him with money to start new buildings of which the cathedral is only a portion of his design. This included the elder Lady chapel, the Chapter-house, the Deanery, the Archdeaconry, the houses of the Vicar's Close with their chapel and library, the gatehouses of the Precincts, the Bishop's Palace, and the prebendal houses in the Liberty. The palace is still among the earliest and finest houses in England, and so well was its fabric maintained by Lord Arthur Hervey, the late bishop, that on his successor (who has just been appointed) coming into office, scarcely one farthing on dilapidations will have to be expended, the diocesan surveyor having reported upon the premises to this effect. The palace was originally built between 1205-1244. The great hall and the chapel, built by Bishop Burnell in the time of Edward I., between 1274-1292, formed main parts of the building, of course; but the hall exists now only in ruins. The gatehouses of the Close were the work of Bishop Beckington during the Wars of the Roses, though they were evidently made more for show, really, than defence. The Bishop's Barn and the Wellhouse in the Bishop's Garden (1490) are both interesting. The Deanery was rebuilt by Dean Gunthorpe (1472-1498), and, in spite of alterations and modern sash-windows, remains a capital specimen of a 15th-century gentleman's house, with a wall inclosure and gatehouse of its own complete. The house of the choirmaster (1480) and the earlier organist's house (1390) are also well worth seeing. The Canons' houses in the Vicar's Close* and the chapel at the northern end of the Close, as well as the common hall at the other extremity, where the vicars dined together, are exceptionally quaint and remarkable. The late Mr. J. D. Sedding, when he was cathedral architect after the death of Benj. Ferrey, restored the chapel in the Close, and Mr. Heywood Sumner decorated it under his direction. The iconography of the west front of the cathedral is unequalled, presenting a magnificent façade of figures with portraits of triumphant monarchs, saints, apostles, and prelates in one great assembly, undeniably beautiful, though in parts the design, if untrammelled by rigid canons of composition, defies in some particulars the limitations of rule. The dignity of expression and posture of many of the statues can hardly be surpassed, and the groups representing the Resurrection, over the west triplet window, are wonderfully fine. Wells Cathedral was finished in 1242, two years after the death of Cimabue. Its building was in progress when Nicolo Pisano, the Italian restorer of sculpture, flourished; it was finished 46 years before the Cathedral of Amiens, and 36 years before Orvieto Cathedral was begun, and it seems to be the first specimen of such magnificent and varied sculpture united in a series of sacred history to be found in Western Europe. Exeter, Salisbury, Lichfield, Crowland Abbey, and Howden Church in Yorkshire, were adorned with sculpture, but on comparison it will be found that the west front of Wells, in this respect, excels them all as the most elaborately ornamented example in England.

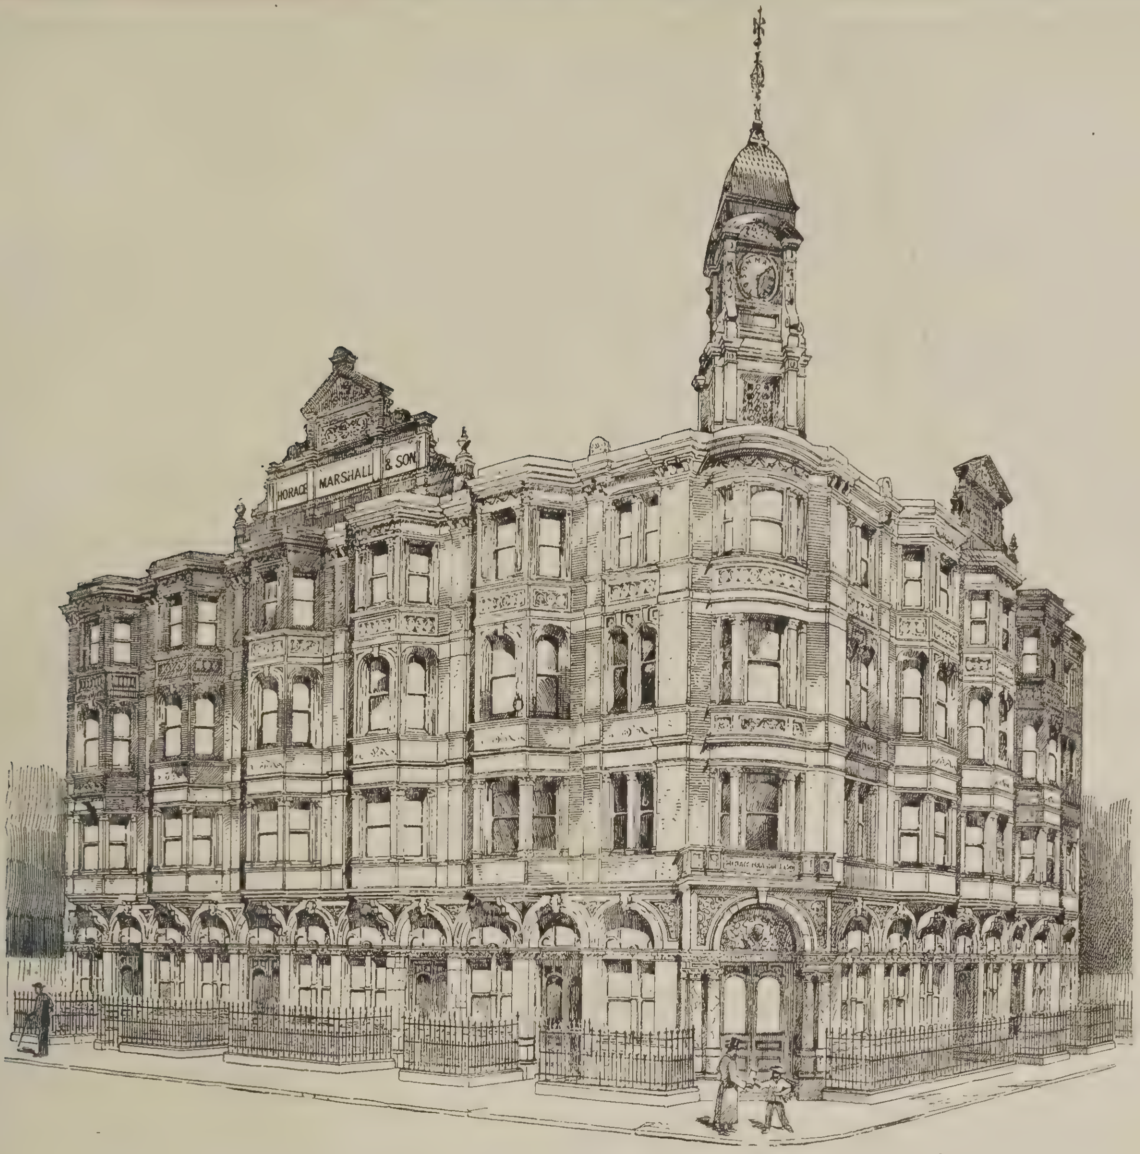


THE SCIENCE AND ART DEPARTMENT.

The annual report of the Department of Science and Art is of interest in its proposals for a more organised system of secondary education. The opinion is expressed that grave defects in that system exist throughout the country. The report speaks of the value of the interchange of ideas afforded by the central Education Departments, the Charity Commissioners, and the Education and Science and Art Departments, these being represented in a committee. Evidence was taken, and a memorandum

---

* A bird's-eye view of the Vicar's Close, Wells, from the Cathedral roof, appeared in the Building News for July 19, 1889, and a plan, with details and views, July 20, 1883. The Deanery bay windows figured in our issue for January 30, 1891. The Chapter House entrance was illustrated by us, April 10, 1891, and the west front, giving the N.W. tower, appeared in the Building News for June 12, 1891. Two interior views of the Cathedral, from the pencil drawings of Mr. Mallows, will be given next week.



NEW PREMISES FOR MESSRS. HORACE MARSHALL AND SON.

drawn up, which was transmitted to the Royal Commission on Secondary Education. The only State-aided schools, apart from the University Colleges, in which secondary education is given are the organised science schools aided by the Departments. These schools have been of great service, and have increased in the provinces. Ten years ago there was only one such school, six years later there were 40, and during the last four years their number has increased to 93. The report says: "If the energies of this class of school can be directed not merely to grant-earning on science instruction, but to really effective educational methods, they may in some measure fill that gap in the education system of England which exists, and to which we have already referred. So long as the present system of payments on results is adhered to in its entirety, there is a danger of the neglect of those subjects which are not included in the Department's directory, and of their being subordinate to instead of co-ordinate with them." The attempt is being made to bring about this co-ordination of subjects. Science has been pursued in the schools in a somewhat fragmentary and unsatisfactory way, without a study of other subjects necessary to a proper education. Thirteen new inspectors have been appointed for the purpose of improving the supervision of science instruction given under the Department. This addition to the staff has enabled it to divide Great Britain and Ireland into districts, in each of which an inspector is located. These inspectors are responsible for the inspection of the schools, and also for the supervision of the temporary local art inspectors who are employed in the examination of art and manual instruction in the elementary schools in their districts. They will also aid the local authorities who administer the funds or grants for technical education. The report observes truly that in some subjects of science the instruction is not sufficiently practical, and it believes that the addition to the staff will make it practicable to supervise and inspect the practical work which is given in the schools. Laboratory work in physical and biological science is specially referred to, and the report hopes to arrive at some plan to promote this part of instruction. Other heads of the report refer to instruction in Science and Art, the Museum, with the branch at Bethnal Green, other Museums in connection with the Department, the Geological Survey of the United Kingdom, the Committee on Solar Physics, Technical Education, &c. The extracts from the reports by examiners are of interest, especially those relating to elementary design by Mr. Lewis F. Day. Mr. Day complains of the inattention of candidates to instructions, and want of obedience to conditions. The remarks also made by Mr. Walter Crane in the advanced stage of design, and by Prof. Roger Smith, the examiner in Architecture, are worth attention by students.

NEW PREMISES FOR MESSRS. HORACE MARSHALL AND SON.

TEMPLE HOUSE, in Temple-avenue, Victoria Embankment, is the name of the new building just completed by Messrs. Horace Marshall and Son, of Fleet-street, in order to meet the expansion of their business as wholesale newspaper agents and publishers. This building is designed in the Italian style, and is constructed of red brick and Portland stone. It occupies a corner site with 100ft. frontage to Temple-avenue and 80ft. to Tallis-street. Both frontages are set back about 5ft. so as to form an area from which a lofty basement is well lighted and ventilated. The basement and ground floor, containing an area of nearly 16,000ft., with hydraulic lift and every convenience, will be devoted to the general requirements of the business, the clerks' offices and stock rooms being on the upper floors. On each of these floors, and fronting Temple-avenue, are suites of offices for the use of editors connected with the various publications issued by the firm, and also offices for the use of the principals. These rooms are approached from the principal entrance by a broad stone staircase, with granite columns and oriel windows. The principal entrance is at the junction of the two streets. Business considerations naturally predominate in the arrangement of the structure; but wherever artistic features have been consistent with convenience and comfort they have been liberally introduced. The architect is Mr. Frederick Boreham, Finsbury Pavement. The builders are Messrs. Patman and Fotheringham, Park-street, Islington.

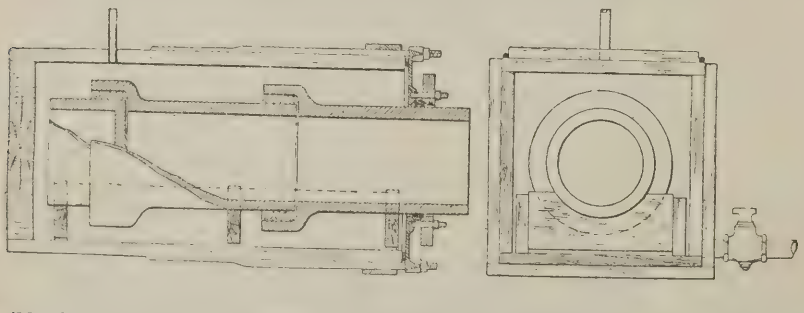
TESTS OF CEMENT SEWER JOINTS.

IN a separate system of sewerage the infiltration of ground water is a serious matter, especially when the sewage has to be purified before its discharge into a water-course. The ground water, in such cases, has to go through the same processes and the same apparatus as the domestic wastes, and consequently the first cost of the purifying works and their subsequent expenses for operation are increased. A large part of the leakage is due to the difficulty of making perfect joints in wet trenches, a difficulty which is greatly increased by the shortness of the lengths of pipe. In spite of the importance of this matter but little definite information has been made public concerning the passage of water through joints. Mr. F. P. Stearns has estimated that the infiltration of ground water into the main sewers of Boston, Mass., equals 45 gallons per capita daily, while at one time half the contents of the sewers of East Orange is estimated to have been ground water, although this proportion is stated to have decreased of late. In view of the lack of data on the matter we give considerable space below to an abstract of an excellent paper by Freeman C. Coffin on the results of some tests of the seepage of water through well-made joints. This paper was recently presented to the Boston Society of Civil Engineers by Mr. Coffin and is a contribution of permanent value to our engineering literature.

The experiments were made in a tank, shown in the cut, in which the pipes could be placed with one open end projecting and with the joints under water pressure from the outside, as in a sewer where the ground water is higher than the pipe. The leakage was carefully collected from the projecting open end of the pipe. All the tests were made under a uniform head of 5ft. above the centre of the pipe, this head being assumed as possibly about the average of that of ground water on sewers. It was obtained by a half-inch pipe screwed to the top of the tank, with a pail at the upper end into which the supply was conducted by a hose.

The pipes used were all 6in. in internal diameter and in lengths of 1ft., made so for convenience in handling. The plug was simply a closed end of pipe of the same diameter and 6in. long, which was placed in the tank as shown in Fig. 1. There were three kinds of joints used. One had a socket of the usual form, leaving room for a ring of cement between spigot and bell about a $\frac{1}{4}$in. thick and $1\frac{1}{2}$in. long. A second joint was made with a socket $2\frac{5}{8}$in. deep with $\frac{5}{8}$in. joint room, and the third kind of joint was made with sockets like the second, on the inside of which a number of roundabout grooves had been made.

The experiments were made in a light, cool basement, with a temperature of about 50° Fahr. The pipes were placed on end with the sockets up and the plug placed in the upper one of the two used in each experiment. The cement was carefully packed into the joints and rammed with a wooden rammer to compact the mortar as much as possible in the joint. The outside of the cement was carefully smoothed with a flat steel blade. When the joints were completed the pipes were covered completely with a damp cloth and allowed to stand undisturbed in that position until the end of the time of setting, when they were placed on a wooden cradle and put into the tank. The end of the tank and the stuffing-box was then placed in position and the water let on. The leakage was not collected for measurement until both joints seemed to be running at their full or normal rate, when the time was noted and the collection commenced. Sixty-three experiments were made in all, and the leading features of the results have been summed up by Mr. Coffin practically as follows :—



In the usual form of pipe socket, with well-made joints of either neat Portland cement, or 1 to 1 mortars of either Portland or Rosendale cements, with overfilled joints, the leakage would probably not exceed 1,000 gallons a mile daily, with the level of the ground water from 2ft. to 8ft. over the pipe. But the small space for cement in this joint makes it difficult to make a full joint in the trench, and although the tests show fairly good results, the difficulties in the way of doing good work in a wet trench lead to the conclusion that a larger and deeper socket is advisable where tight work is desired.

In pipe with deep sockets the tests indicate that if the joints are well made the leakage would be about as follows: With neat Rosendale cement it might be over 100,000 gallons a mile daily, while with 1 to 1 Rosendale mortar it would probably not exceed 700 to 800 gallons. With 1 to 2 Rosendale mortar it would approximate 1,000 or 1,200 gallons a day. With neat Portland cement about 150 gallons might be expected, and with 1 to 1 Portland mortar from 500 to 600 gallons. Mr. Coffin finds that the advantages of the wider and deeper sockets lie in the greater ease with which the mortar can be put into the joint, in the facility with which a wooden rammer of sufficient size may be used, in the greater depth of the joint along the pipe, which apparently reduces the seepage and increases the liability of imperfectly filled portions of the joints being covered by better compacted portions, in giving a greater body of cement to resist the action of the water reaching it before it is set, and in allowing the mortar to be placed within the joint instead of outside of it, which latter is of doubtful value in a trench where water is liable to reach it before it is set. The increased length of the joint aids very materially in preventing the pipe from moving in the joint and thereby making a direct passage for the water into it.

A gasket apparently increases the leakage by reducing the length of the joint and thus the resistance to the passage of water, but in a very bad trench where the water is likely to blow or wash the cement from the joint it would prevent the sand from entering the pipe, and if thoroughly saturated in a grout of neat cement might prevent the passage of water somewhat. If the water, or the pressure of water, could be kept from the pipe for 12 hours it would materially reduce the seepage, especially in the Rosendale cement.

The great trouble seems to be to make good joints, largely on account of the shortness of the pipe. If 3ft. lengths were adopted in the place of 2ft. lengths the number of joints would be reduced one-third. Mr. Coffin further suggests the experiment of making half the joints on the bank when the trench is wet, in a sort of cradle which will insure good alignment; this would leave but half the joints to be made in the wet trench. If neat Portland cement were used the pairs of pipes could be removed from the cradle after $1\frac{1}{2}$ hour, and if Rosendale cement were used they could be removed in four or five hours, although a longer time would be desirable. Mr. Coffin believes that nearly perfect joints could be made in this way in from one-sixth to one-third the time required in the trench, with less waste of cement. Then there would be 6ft. lengths to lay, which could be readily done in a good manner by damming the section of the trench and pumping it dry.

In making the experiments no attempt was made to test different brands of cement. That used seemed to be of good quality, but was not examined except by a sieve having 6,400 meshes to the inch, which retained 14 per cent. of the Portland and 28 per cent. of the Rosendale cements.

DESIGNING OF STEEL BRIDGES, THEORETICAL AND PRACTICAL.—VI.

HAVING ascertained in our last articles the maximum stress upon the centre of either of the flanges of our plate girder, we may now proceed to provide the necessary sectional area, and arrange the riveting for the whole of the built-up section. Omitting decimals, we require 29sq.in. for the net sectional area of the upper flange, and 25sq.in. for that of the lower. We shall deduct the rivet-holes in both flanges, and disregard the much-mooted question whether the holes weaken steelwork in compression to the full amount of the area of metal punched or drilled out. That they do not has been well established; but as the percentage of loss is very small, the result will be a small corresponding gain to the strength of the upper flange of both main and cross girders, and in fact to all of the members subjected to a compressive stress. The value of the reduction, which was represented in our articles on "Riveted Joints" published in the early part of the present year, is given by the general equation—

$$N = (G - x),$$

which, as will be seen, assigns but a small amount to x. In Fig. 7 a plan of the interior of part of one of the flanges, and in Fig. 8 a plan of part of the exterior, is shown. The width of the flange is 18in., so, deducting the diameter of two rivets, we have the value of each flange plate $\frac{1}{2}$in. in thickness equal to—

$$\left(\frac{18 - \frac{3}{2}}{2}\right) \times \tfrac{1}{2} = 8{\cdot}25\text{sq.in.}$$

of net sectional area. Making the angle-irons of the flanges equal each to 4in. × $3\frac{1}{2}$in. × $\frac{1}{2}$in., we have the value of one equal to—

$$(4 + 3 - \tfrac{3}{2})\,\tfrac{1}{2} = 2{\cdot}75\text{sq.in.}$$

The requisite sectional area for the upper flange can be obtained in the following manner—

Three plates 18in. × $\frac{1}{2}$in. .... =	24·75sq.in.
Two angle-irons 4in × $3\frac{1}{2}$in. × $\frac{1}{2}$in.. =	5·50sq.in.
Net sectional area of upper flanges.. =	30·25sq.in.

For the lower flange under a tensile stress, owing to the higher unit stress adopted, only 25sq.in. are required, which is easily insured by diminishing the thickness of two of the flange-plates to $\frac{3}{8}$in. and the calculation will stand thus—

One plate 18in. × $\frac{1}{2}$in.	8·25sq.in.
Two plates 18in. × $\frac{3}{8}$in.	12·49sq.in
Two angle-irons 4in. × $3\frac{1}{2}$in. × $\frac{1}{2}$in. ..	5·50sq.in.
Net sectional area of lower flange	26·24sq.in.

It will be seen that both these areas are a trifle in excess of what theory actually demands. Instead of employing two plates, each $\frac{3}{8}$in. thick, the same object could be gained by using only one $\frac{3}{4}$in. thinkness; but for girders of comparatively small span this dimension would be rather heavy, and in practice it is advisable not to make too great a "jump" in the thickness of the different plates or bars. In designing the flanges of girders, the width should be kept constant, and the size of the angle-irons, and the difference of the area required near the ends effected by dimishing the thickness, or "dropping" one or more of the flange-plates, as will be presently pointed out. The horizontal section in Fig. 7, and the outside plan in Fig. 8 will answer for both the upper and lower flanges of our main girders, the difference being apparent in the cross section of the whole girder in Fig. 9.

Although theoretical rules are given in plenty for the pitch of the rivets in girder work, that dimension is usually determined by precedent and experience. While on the one hand there is no necessity for centring the rivets so closely as they are placed in boilers, tanks, and other examples of construction which are to be water-tight, steam-tight, or air-tight; on the other hand, if they are given too great a pitch, the plates, especially if thin, are liable to "spring," and dirt and moisture find their way in between them, speedily setting up corrosive and destructive action. A thorough examination of bridgework which has been some time in use will well reward the young engineer or architect for his trouble, and will reveal to him some practical information relating also to the scraping and repainting of iron and steel which generally is only possessed by those practically engaged in those operations. It must be borne in mind the plates are pressed together more closely and uniformly by steam or hydraulic riveting—which are almost universally employed now—than is possible with the old hand method, which can, nevertheless, do excellent work under efficient guidance and supervision. The pitch of the rivets in our example in Figs. 7, 8, and 9 is 6in. from centre to centre in every position; they are so spaced on the one half of the flange as to break joint with those corresponding to them on the other; but the difference between the line of fracture taken straight or square across the angle-iron of the flanges, and in the slightly zigzag direction shown in the figs. is small, and practically the two lines are frequently regarded as one, and the rivets connecting the web and the vertical rib of the angle-irons of the flanges made to centre with those in the horizontal rib of one or other of the angle-irons. The latter arrangement also possesses the practical advantage of dispensing with an additional "templet" in making out the rivet-holes on the plate *n*, and so saves both time and labour in the shops. For plates and angle-irons of the scantlings we have selected, the diameter of all the rivets is ¾in. In order to complete the cross-section of the main girders at the centre, we have to find the thickness of the plate-web, which must, for practical reasons inseparable from the construction of the girders, be made very considerably stronger than what is required by the stresses brought upon it. It was demonstrated in Article IV. that the shearing stress at the centre of the plate-web of a girder was equal to one-eighth of the greatest rolling load that could be brought upon it. It will not be correct, in determining the stresses upon the web, to consider the line or rolling load uniformly distributed, as was done in the case of the flanges, for if that assumption were adopted, there would be theoretically no stress upon the web at the centre, instead of the amount already determined. The rolling or total line load on each main girder $= \frac{(231 - 75)}{2} = 78$ tons, and dividing this by 8 we obtain the shearing stress equal to 10 tons requiring only 2sq.in. of net sectional area. The depth of the main girders has been taken equal to 5ft. over all at the centre, which has also been adhered to in the calculations respecting the stresses; but it should be mentioned that this dimension in large girders is measured from the centre of gravity of the flanges, and is called the effective depth. It is at this point also where the connection between the flanges and web is supposed to be made, and girders have been designed with flanges built up of a section intended to especially insure this requirement. At the same time it is very doubtful whether any appreciable practical advantages accrue from paying too much attention to mere theoretical minutiæ. This is the rock upon which the simple scientific and mathematical designer, without the practical knowledge and experience of the professional man, invariably splits. He is totally ignorant of the fact that, while endeavouring to balance the direction of forces to the fraction of a line, and twisting and torturing the material into shapes and forms unknown to the metallurgist and manufacturer, he is adding most seriously to the cost of his structure, which, in these days of strenuous competition both at home and abroad, is a primary consideration for all parties concerned. The engineer and the architect, as well as the members of the other professions, may gain a useful lesson from the old Latin adage, *In medio tutissimus ibis.*

FIG. 7.

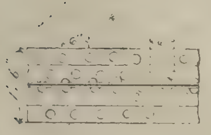


FIG. 8.

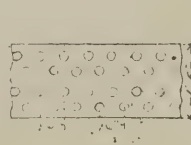

FIG. 9.

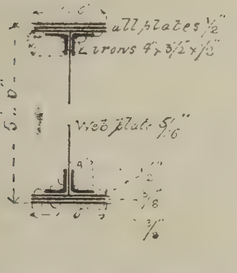

It is evident, from the small quantity of material required in the web plate at the centre of the girder, that its thickness may be reduced to the smallest amount consistent with other considerations, which fix it at five-sixteenths of an inch. There is a detail connected with the action and function of a continuous or plate web which should be brought forward, as some diversity of opinion exists on the subject, although so far as the treatment of it is concerned the consensus is nearly universal. The question may be thus put: Does the continuous web relieve the flanges of any of the longitudinal stresses developed upon them, and if so, should the net area of that small part of the plate web riveted in between the horizontal angle-irons of the flanges be included in the total net sectional area of the flanges? It has been asserted by the partisans of the solid-web type of construction that the plate web does relieve the flanges of an amount equal, as the maximum, to one-sixth of their longitudinal stresses of tension and compression respectively. This assertion is, however, doubtful, and the rule is to regard the small part of the web as distinct from the flanges in all calculations of the stresses upon either of them, although it is well known that the solid web does not act partially in the manner alleged. To the second question the answer is also in the negative—so much so, that in some instances it is stipulated in the conditions to be observed by candidates in designs for competition, that no portion of the solid plate of a continuous web shall be included in the calculations of the net sectional areas of the flanges. After deducting the number of rivet-holes made in the web for the purpose of attaching the vertical differences, as will be presently perceived, the remaining net sectional area of the web will be so largely in excess of what is necessary, that there is no need for working out the numerical result. The thickness of the web will be seen to be determined by the maximum shearing stress upon it, which occurs over the bearings at the ends of the girders. Thus the cross section of the main girders of our plate bridge at the centre, supposing there is no stiffening plate at that point, will be represented in Fig. 9, in which the web is shown broken, so as to allow of the whole cut being drawn to a larger scale without encroaching too much upon valuable space.

As the stresses upon the flanges vary, *cæteris paribus* as the product of the segments into which the total span is divided by the point where any particular stress is required, the sectional area may be decreased towards the ends, where one of the segments is equal to zero. This diminution of the area is best accomplished by discontinuing or "dropping" one or more of the horizontal flange plates, and the next feature in the design is to determine the point where one of the half-inch plates in the upper flange, for instance, may be dropped. If we put E to represent the efficiency or value of a plate in tons, *a* the net sectional area, and F the unit stress for the material, we shall have, for one ½in. plate—

$$E = a \times F = 8{\cdot}25 \times 6 = 41{\cdot}50 \text{ tons.}$$

The central stress was found to be equal to 172·5 tons, so that (172·5 − 41·5) = 131 tons, and the problem therefore resolves itself into that of finding the point in the girder where the stress is equal to that amount.

Our equation for the longitudinal stress at any point of the upper and lower flange, dividing the span into any two segments x and y, is—

$$S = \frac{W\,(x \times y)}{2 \times D \times L},$$

from which we obtain—

$$(x \times y) = \frac{2 \times D \times L \times S}{W}.$$

Make the right-hand side of the equation equal to z, and putting $y = (L - x)$, we have—

$$x^2 - x\,L = -\,z.$$

Solving the quadratic, it gives us—

$$x = \pm \sqrt{\left(\frac{L}{2}\right)^2 - z} + \frac{L}{2}.$$

Inserting for z its value $Z = \frac{2 \times D \times L \times S}{W}$ = 684, we find—

$$x = \pm \sqrt{216} + \frac{L}{2}$$

and, finally, we obtain for the length of the segment x—

$$x = \pm\,14{\cdot}42 + \frac{L}{2}$$

Since $\frac{L}{2} = 30$, subtracting gives—

$$x = 15{\cdot}58$$

and adding makes—

$$y = 44{\cdot}42$$

Consequently at 15in. from the ends of the girder over the bearings one of the flange plates may be dropped both above and below.

The point where the second plate may be dispensed with will be found by a repetition of the same calculation. Deducting another 41 tons from 131 tons we shall obtain—

$$z = 469{\cdot}8,$$

and thence—

$$x = 9{\cdot}27 \text{ and } y = 50{\cdot}73.$$

We have preferred this method of arriving at the points required, as our own notation is adhered to, and, besides, in future articles, these calculations will not be again entered into, but assumed as established, and referred to when the subject demands them. Those of our readers who prefer it, may use the following simpler formula, where the adfected quadratic is replaced by a pure quadratic. Put r equal to the distance from the centre of the girder of the point dividing the segments, then—

$$x = \left(\frac{L}{2} - r\right);\ y = \left(\frac{L}{2} + r\right)$$

from which—

$$(x \times y) = \left(\frac{L}{2} - r\right) \times \left(\frac{L}{2} + r\right) = Z$$

Multiplying the two factors, we have—

$$\left(\frac{L}{2}\right)^2 - r^2 = Z,$$

whence—

$$r = \sqrt{\left(\frac{L}{2}\right)^2 - Z}.$$

Making Z as before = 684, then r = 14·42, and x = 30 − 14·42 = 15·58, the value obtained by the previous calculation.

We have now ascertained all the data needed for designing the flanges of the main girders; but there is still another stress upon the web to be determined, which is the maximum shearing stress upon it, and occurs over the bearings, and is equal to

$$\frac{W}{2} = \frac{115}{2} = 58 \text{ tons,}$$

which will require 10sq.in. of material. Allowing for all rivet-holes, the net sectional area of the web may be put at 52in. × $\frac{5}{16}$in., which will leave a more than sufficient margin for safety. We can now plot the elevation, plan and sections of the main girders, and in so doing we shall draw attention to the practical precautions necessary to impart the proper degree of stability and rigidity to the whole structure.

THE THRUSTS ON WALLS AND ARCHES.*—VII.

By G. A. T. Middleton.

ARCHES.

THE theory underlying the correct designing of arches can be expressed in very few words—the line of resultant pressures should in all cases pass within the centre third of the arch ring. In practice, however, it is found that in ordinary cases it is sufficient if this line of resultant pressures pass within the centre *half*, instead of the centre *third*, of the ring; and, of course, in addition to this, the material of which the arch is built must be sufficiently strong to with-

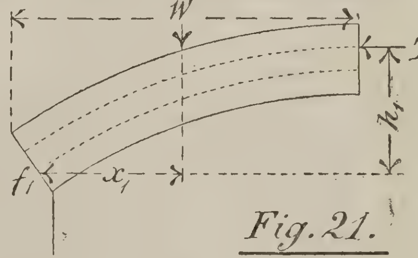

Fig. 21.

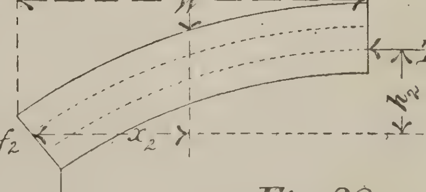

Fig. 22.

---

* All rights reserved.

stand these resultant pressures safely. The problem is, therefore, to determine the value and direction of these resultant pressures.

In the case of a symmetrically loaded arch it is clear that the thrust at the crown is a horizontal thrust. Its true value, however, is difficult to determine, varying according to where within the centre third of the arch ring it acts. In Fig. 21 it is shown acting at the outer, and in Fig. 22 at the inner extremity of the ring; its true position is, in all probability, somewhere between these two extremes. Half of the arch only is shown in either diagram, for the sake of clearness, and in each the weight resting upon the half arch is concentrated at its centre of gravity, acting downwards vertically as lettered, W.

Taking the extreme case shown in Fig. 21, the value of the thrust T_1 is determined by taking moments about the point f_1 at the abutment extremity of the dotted outline of the *inner* side of the centre third of the arch ring.

Then— $T_1 \times h_1 = W \times x_1$

and therefore— $T_1 = \dfrac{W \times x_1}{h_1}$

Taking the other extreme case shown in Fig. 22, the value of the thrust T_2 is determined by taking moments about the point f_2 at the abutment extremity of the dotted outline of the *outer* side of the centre third of the arch ring.

Then— $T_2 \times h_2 = W \times x_2$

and therefore— $T_2 = \dfrac{W \times x_2}{h_2}$

Taking either of these extremes, it is treated as shown in Fig. 23. The thrust T_1 is compounded with the weight K of the voussoir nearest the centre of the arch, and all it carries, acting through their combined centre of gravity. The resultant R is found, and is produced to cut the joint between this voussoir and the next, the point where it does so being one point in the line of resultant pressures, and consequently it should lie within the centre third of the arch ring.

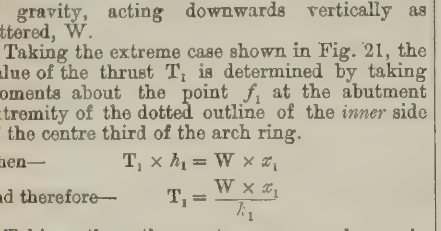

Fig. 23.

This resultant is similarly compounded with the weight of the next voussoir and what it carries, a fresh resultant being found and produced to cut the next joint, and so on. The points where these resultants cut the joints to which they relate are all points in the line of resultant pressures, and should all fall within the centre third of the arch ring. If they do so, the arch is stable under one of the extreme cases, and no further inquiry is needed; if not, the other extreme case must be tried. If this also result unsatisfactorily, it will either be evident at once that the voussoirs must be deepened, or that there is some intermediate case which will give a satisfactory result; and in either event the same process of further trial must be continued until a resultant line be found which lies wholly within the centre third of the arch ring.

It will be noticed that a vertical joint is assumed at the centre of the arch, and this is done for convenience of calculation. As a matter of fact, the voussoirs assumed for calculation need not be those used in actual practice, a brick arch of several rings of brickwork, for instance, being treated for calculation as of one ring only of the total depth, and as cut into some half a dozen or dozen voussoirs only. It is well, however, where possible, that the joints between the voussoirs should be at right angles, or nearly so, to the resultant pressure which impinges upon each.

In the case of an unsymmetrical load—by no means an uncommon thing in buildings—the horizontal thrust is found to be under the centre of gravity of the loads. It is there where the thrusts T_1 and T_2 for the two main trial cases have to be ascertained by taking moments round f_1 or f_2, as already explained. Beyond this the calculations are identical.

It is also possible to solve these problems by means of a side diagram; but to give this second method would possibly only serve to confuse students, and make them think that complicated which is in reality quite simple.

◆

BOOKS RECEIVED.

Brick for Street Pavements, new edition, by M. D. Burke, C.E. (Cincinnati: Robt. Clarke and Co.), is an account of tests made of bricks and paving blocks which can hardly fail to be of interest to all borough surveyors. Mr. Burke writes from experience of the use of brick pavements, and his pamphlet is founded on a report made to the village authorities of Avondale, where he is engineer. Several samples were furnished by manufacturers by request. Three cubes of each variety of brick were used, the absorption, specific gravity, crushing strength being severally tested. Mr. Burke describes the specimens submitted, how the tests were made for absorption, crushing strength, transverse strength, abrasion, and impact. The results are tabulated for every variety of clay. The author says absorption should be placed at the lowest limit, say 2 per cent. as a maximum; specific gravity, 2$\frac{1}{10}$ as a minimum; the crushing strength should not be less than 12,000lb. per square inch as an average, the limit of variation not to exceed 25 per cent. below. The construction is discussed very fully, and a paper on country roads is added. Mr. Burke's pamphlet is a comprehensive and systematic treatise on brick pavements.——*Cassier's Magazine*, July, No. 33 (New York: Cassier Magazine Co.; London: Lay and Bird, 5, Chandos-street). The present number of this beautifully-illustrated record of engineering industry, steam, and electricity, is full of instructive matter. Mr. W. G. Bonner writes a most interesting paper on "The Redwoods of California," illustrated by sixteen views of forest scenes, saw mills and machinery, which gives a graphic though faint idea of the solemn grandeur of the redwood forest, and the mysteries of its age and growth. The photo. blocks convey some idea of the giant trees of this primeval forest and the means taken in transporting the huge logs. Mr. F. G. Coggin's paper on "The Ferris and other Big Wheels," with illustration of some of the largest wheels in the world, has an interest just now especially for the engineer. Other papers are on "Mechanical Draught," by W. R. Roney; "Relations between Gas Companies and Consumers," by W. Paul Gerhard, C.E.; "The Light of the Future," by D. Macfarlane Moore, &c. These are all illustrated. The magazine is well printed, and is a cheap shillingsworth.——The quarterly issue of the *Essex Review* (Chelmsford: E. Durrant and Co.) contains an interesting article on the twin churches at Salcot Wigborough and Salcot Virley, in the district popularised by the Rev. S. Baring Gould in *Mehala*, by Mr. Fred Chancellor, J.P., F.R.I.B.A., illustrated by sketches and plans. The former church has been almost rebuilt in the past two years, and the latter, always dilapidated, was so shattered by the earthquake of 1884, that it has been suffered to remain a roofless ruin. Mr. B. R. Branfill writes a readable article on Billericay, and Mr. F. Carruthers Gould describes and illustrates his "Germ-Hunting in Mehalaland." The notes and queries are of considerable local interest.——*Journal of the Sanitary Institute* (London: Edward Stanford).—Vol. XV., Part II., for July, contains several papers by Mr. Lewis H. Isaacs, F.R.I.B.A., on the "Construction of Roads and Streets from a Sanitary Point of View"; by Mr. G. J. Symons, F.R.S., on "Meteorological Instruments and Sanitary Work"; by Mr. H. R. Mill Dow, D.Sc., F.R S.E., on the "Temperature of Soil, Water, and Air"; by Mr. R. A. Scott, F.R.S., on "Barometrical Conditions and Air Movements"; by Mr. W. Marriott, F.R.Met.Soc., on "Moisture: its Determination and Measurement"; by Mr. D. C. Theodore Williams, M.A., &c., on "Climate in Relation to Health, &c."; by Mr. F. Gaster, F.R.Met.Soc., on "Fog, Cloud, and Sunshine." Dr. Parkes, M.D., D.P.H., contributes an article on the "Possibility of the Spread of Disease through the River Waters Supplied to London." The volume contains also reviews of books; "Notes on Sanitation Abroad"; "Hydraulic Formulæ," by Mr. Henry Law, M.Inst.C.E.; law cases; programme of Liverpool Congress, &c.——*Chapters in Workshop Reconstruction and Citizenship*, by C. R. Ashbee, M.A., Architect (London: Guild and School of Handicraft, Mile-end-road).—The chapters in this volume, which is got up with some regard to artistic finish in its printing and the vignettes which adorn every chapter with delightful disregard of conventionalities, are instructive and interesting. Many gossipy dialogues may be found in the book upon art as it is, and as it might be; on the questionable wisdom of looking for the cultivation of beauty from the British middle class; on the teaching of design and its relation to workshop reconstruction; the relation of the architect towards the workshop, and the possibility of a Metropolitan school of architecture. Mr. Ashbee is a clear and pleasant writer, and, what is better, has right views of art and craftsmanship. He endeavours to show, in his own words, "not that the demand should be created and the supply increased, but that the demand is already there, only misdirected, and the supply, produced on false and artificial systems, in part, because of this misdirected demand. That, in fine, what we have to do is to guide demand by education, and to influence supply by workshop reconstruction." The author says truly, if beauty is to be made an element in our production, or in the life of our citizens, we must reconstruct the workshop—that is, our system of production in its social and industrial bearings. Citizenship must be changed before we can hope to produce better and more artistic objects than the "commercial artical" which is only made to sell. We advise all thoughtful artists and craftsmen to read "A Few Definitions towards an Ideal." The collectivist ideal is more to the purpose than the revolutionary socialism, as it is more constructive in its methods, and retains that regard for the past and for order which is necessary to progress. The fifteen chapters of this book which we have generalised are well worth reading, especially those on "Decorative Art from a Workshop Point of View," "Teacher and Humourist," "On the Teaching of Design," "The Higher Aspects of Technical Education."——*Society of Engineers: Transactions for* 1893, edited by G. A. Pryce Cuxson, the secretary (London: E. and F. N. Spon), contains the Inaugural Address of the President, "The Leicester Main Drainage," by Mr. E. G. Mawbey; "The Cleaning of Tramway and other Rails," by Mr. Henry Conradi; "Blake's Bridge, Reading," by Mr. Edmund Burrows; "Hydaulic Lifts," by Robert Carey, &c. The volume is illustrated by several plates, and there is a good index.——*The Sanitary Arrangement of Dwelling-Houses*, by A. J. Wallis-Tayler, C.E., Assoc.M.Inst.C.E. (London: Crosby Lockwood and Son), is a useful handbook for householders and owners of property. The author avoids the technical style of most treatises, and gives in a plain way the information necessary for the householder on sanitary fittings and arrangements, the proper draining of dwelling-houses and their ventilation, heating, and water supply are discussed, and the provisions of the Public Health Act, 1875, and the Public Health (London) Act, 1891, which bear on sanitary arrangement and the model by-laws, &c., are appended. The book is well illustrated, and the most recent types of sanitary fittings and appliances are selected.——*The Sanitary Engineers' Pocket Report-Book*, compiled by E. A. Sandford Fawcett, A.M.I.C.E. (London: E. and F. N. Spon), is a useful series of heads for reporting on drainage, water supply, and the sanitary condition of premises, for the use of sanitary engineers and experts in examining, testing, and reporting on these matters. These heads are given on every double-page of the book, with blanks for filling in, and relate to outfall of drainage, inspection chamber, intercepting-trap, fresh-air inlet, main drain, branch drains, soil-pipes, ventilating pipes, rain-water pipes, sinks and wastes, baths, lavatories, closets, water-supply, cisterns, result of smoke-test, ditto of water-test, remarks. A full index, with pages of sectional paper divided into tenths of an inch, for sketching plans, &c., is given. We recommend this pocketbook to all specialists and inspectors who have to make reports on the sanitary state of dwellings.

◆

The east window of Bothal Church has just been filled with stained glass. The subjects illustrated are "The Sermon on the Mount," and on the right and left are two figures of St. Peter and St. Paul. The window has been executed by Messrs. Atkinson Brothers, Newcastle-on-Tyne.

CHURCH EMBROIDERY, BY MAY MORRIS: TISSUE, ITALIAN XIII. CENTURY.—ARCHITECTURAL ASSOCIATION EXCURSION SKETCHES. — ST. GEORGE'S HOME, CAPETOWN, S.A. — NEWPORT INTERMEDIATE AND TECHNICAL SCHOOLS.

Our Illustrations.

CHURCH EMBROIDERY.—NO. XII.

For description of this Italian tissue in the South Kensington Museum, see Miss May Morris's article on p. 168 *ante*.

ARCHITECTURAL ASSOCIATION EXCURSION SKETCHES.

We give, among our illustrations, five single-page sketches of some of the more interesting buildings to be visited during the forthcoming A.A. excursion to Wells and its neighbourhood. A descriptive article, with view of interior of Croscombe Church, appears on pp. 169-70, and on p. 171 are a plan of Wells Cathedral and a perspective sketch of Stourhead House.

ST. GEORGE'S HOME, CAPE TOWN, S.A.

This extensive and comprehensive series of buildings, illustrated by us to-day, represents the new Home of the Sisters of All Saints at Cape Town. The buildings include, besides the "home" proper, an orphanage (St. Michael's) for some 200 children (boys and girls), a boarding-school for young ladies (St. Cyprian's), a day-school (St. Hilda's) for girls who require a less complete education, and a chapel for the use of the several institutions. The accommodation for each department is most complete—arranged on a plan which is conventual, and brings the different institutions under one organisation with greater facility of management. The style of architecture adopted seemed the most suitable to the purpose, and the buildings, though of very simple façades, form an effective group. The site is elevated and extremely salubrious, commanding a view of Table Bay and of Cape Town. It is not, however, more than a mile from the centre of the city. The total cost of the whole scheme is estimated at £33,000 to £35,000. The portion now in course of construction and nearly completed will cost £22,000, and will comprise the "home" and orphanage, with kitchens, laundry, stables, &c. Construction has been carried out as economically as possible; the cost generally may be reckoned at 5d. per foot cube. The foundations to plinth level are of rubble stonework, and the superstructure of brickwork set in clay mortar or "daaga," as it is locally called, and plastered outside in rough-cast, relieved by quoins, bands, &c., of red pressed bricks. Inside the walls have been flush-pointed (not plastered at all) and coloured with calcareum. This is found to be quite satisfactory in appearance, and to answer admirably every way. The buildings are connected with the city water supply and drainage systems, so that their sanitary provisions are most complete. They are being executed from designs by, and under the supervision of, Mr. Sydney Stent, M.Inst.C.E., F.R.I.B.A., of Cape Town; and the contractors are Messrs. W. and G. Scott, also of that city.

NEWPORT INTERMEDIATE AND TECHNICAL SCHOOLS.

In March last eight sets of designs for the above building were sent in by local architects. The governors selected Mr. B. Lawrence's plans, which we now illustrate, and awarded him the first premium of twenty-five guineas, and the second premium of fifteen guineas was given to him, in conjunction with Mr. Charles J. Fox, for their plans, which had an almost similar arrangement, but as a mixed school. The selected plans have been somewhat modified and reduced to meet the present expenditure; but the complete scheme will be in accordance with the submitted designs, and the work will be carried out under Mr. Lawrence's superintendence.

CHIPS.

The joint committee of school boards, who have combined for the purpose of erecting a school for the deaf and blind children in North Staffordshire, have appointed Mr. Scrivener, of Hanley, as their architect.

A new organ in Kenwyn Church, near Truro, built by Messrs. Brewer and Co., of that city, at a cost of £325, was dedicated last week.

Warrants have been granted to the Edinburgh School Board, in the Dean of Guild Court of that city, to make alterations on or additions to seven of their schools. They propose to add a wing to Leith Walk School, to erect boundary walls at North Merchiston School, and to make alterations at Regent-road, New-street, and Canonmills schools. The largest alteration will be made at Abbeyhill, where a school for infants is to be erected, with a swimming-bath on the basement floor. The architect for the works is Mr. Robert Wilson, Queen-street.

The central free library at Birmingham has just been redecorated by Mr. E. H. Thompson at a cost of about £850. A new branch library in Moseley-road, in the same city, is about to be built from plans by Messrs. Jethro A. Cossins and Peacock at an estimated cost, including clock-tower and suite of public baths, of £5,500.

A scheme of sewerage and sewage disposal has been prepared for the local board of Brigg by Messrs. Pollard and Atkinson.

The foundation-stone of a new church at Kilkeel, co. Down, was laid last week by the Countess of Kilmorey. The building is Gothic in style, will seat 200 persons, and will cost £2,000. The architect is Mr. David C. Salmond, of Windsor-place, Cardiff, who is laying out Kilkeel as a seaside resort.

New works of water supply have just been completed for the borough of Newark. The reservoir, a covered one, is built on Edingley Hill, and the pumping station is at Farnsfield. Mr. Rofe, C.E., was the engineer, Mr. Rayner the assistant engineer, Mr. Davis the clerk of works, and Mr. Jenkins the contractor for the pipe-laying.

The town council of Edinburgh have under consideration a scheme prepared by Mr. T. Morham, the city architect, for a reconstruction of the City Chambers at an estimated cost of £50,000. A new council chamber, two and a half times the size of the existing one, would be the chief feature of the new building.

At Tuesday's meeting of the North Riding County Council, it was reported that five architects had sent in competitive plans for the proposed county buildings, and that Mr. Alfred Waterhouse, R.A., had been appointed assessor.

The business premises in Old Bond-street, W. which were built for and occupied by a firm of auctioneers until they removed to Willis's Rooms, have lately been altered into showrooms. The architects who carried out the original work and all alterations are Messrs. J. T. Wimperis and Arber, of 25, Sackville-street, Piccadilly, W.

The foundation-stone of a United Methodist chapel was laid in Ivor-street, Newport, Mon., on Friday. The chapel will be square on plan, but it is octagonal from 10ft. above the ground floor. Cusped and traceried hammer-beams support the roof and a central flèche. The style adopted is Early English, and the materials are red bricks for walling, and moulded bricks of the same colour for arches and dressings. Accommodation is provided for 500 persons all on the ground floor. Beneath the chapel are classrooms. The architects are Messrs. Swash and Bain, of Newport, and the contractor is Mr. John Jenkins. The cost will be £3,500.

New railway stables are being erected at Birmingham by the Midland Railway Co., and special consideration has been given to the ventilation, which will be effected on the Boyle system, the latest patented improved form of self-acting air-pump ventilators being adopted for the extraction of the vitiated air.

COMPETITIONS.

City of Londonderry.—The design selected in open competition for the Corporation public baths is by Mr. Horace T. Bonner, A.R.I.B.A., of 29 and 30, King-street, Cheapside, London, who has been instructed to proceed with the work.

Darlington School Competition.—We are informed that the account we published last week of the result of a competition for new schools is incorrect, in so far as it stated that Mr. Robson, the referee, named any order in the merit of designs beyond the first and second.

Huddersfield. — The town council have adopted the joint report of the assessors on the designs for a fever hospital to be built at Mill Hill, Huddersfield—Mr. Alexander Graham, F.R.I.B.A., Regent-street, W., and Dr. Whitelegge, medical officer of health for the West Riding—and have awarded the design marked "Aspect," by Messrs. Edward Thomas and Sons, 7, Queen Anne's-gate, S.W., the first premium of £105; "Microbe" (B), by Messrs. Groll, Minty, and Webbe, of William-street, Hampstead, N.W., the second premium of £75; and have bracketed third those under the mottoes "Efficiency and Economy," by Messrs. R. Thornton Shiells and Thomson, Edinburgh, and "Hygeia," Mr. J. W. Donald, South Shields, dividing between these competitors the third premium of £50. Fifty-six designs were sent in.

Langholm.—The Hope Trustees, having considered the report of Mr. Ewan Christian, London, the assessing architect, on the competitive plans for the Thomas Hope Hospital to be erected at Langholm, have resolved to accept the design sent in by Mr. Woodd, New Bond-street, London. They have also resolved to proceed at once with building the hospital. Mr. Hope bequeathed over £100,000 for the erection and endowment of the hospital, which is to be for the benefit of aged and infirm persons belonging to the district.

Littleborough.—Twenty-five sets of designs were submitted in competition for the new local board offices, fire-engine station, and stables to be built for the district of Littleborough at a cost of £4,000, and the board has confirmed the report of the assessors, Messrs. Woodhouse and Willoughby, of Manchester. The design submitted by Messrs. Clark and Hutchinson, of John-street, Bedford-row, W.C., marked "No. 23," was placed first, and the plans by Messrs. Duncan and Butterworth, of Rochdale, were awarded the second premium, their drawings bearing the number "14a." The referees, in their report, state that the general merit of the schemes submitted for so small an undertaking was in several cases of exceptional character. The chosen design is described as very meritorious, and admirably adapted to the several purposes of the proposed buildings, which can be built for the stipulated amount. Five of the principal offices overlook the street, and are square and well-proportioned rooms. Design marked No. 3 was placed third. The plans have been on view this week in the Hare Hill-road Offices.

◆

The committee of the Central London Throat and Ear Hospital, Gray's Inn-road, have adopted the plans of Mr. Ernest Turner, F.R.I.B A., for a new out-patient department, and a contract for the erection of the buildings has been entered into with Messrs. J. Simpson and Sons.

An International Health Exhibition was opened at Boulogne-sur-Mer on Monday by M. Mastier, Director of Administration at the Ministry of the Interior. The exhibition is situated on the open triangular space in front of the Casino gardens, and occupies a portion of the Chamber of Commerce buildings. There is an interesting and extensive collection of sanitary and hygienic appliances of all kinds, and the grounds of the exhibition are attractively laid out with walks and fountains.

On Friday, Major Yorke, one of the Government inspectors, inspected the extension of the North Cornwall Railway from Delabole to Port Isaac-road, which has recently been completed by Messrs. Currie and Reeve, railway contractors. The Major was accompanied by Mr. Salter, resident engineer North Cornwall Railway; also by Mr. Church, the L. and S.W.R. Company's consulting engineer, and Mr. Reeve, one of the contractors, personally represented the firm. It is expected that the new line will shortly be opened for passenger and goods traffic, thus extending the L. and S.W.R. route another 3½ miles into Cornwall. The next sections which will be from Port Isaac-road to Wadebridge, is well in hand, and it is expected it will be completed and opened for traffic early in 1895.

WAYSIDE NOTES.

UNDER the auspices of the Society of Antiquaries, which is the one really working body of archæologists, it is proposed to initiate a scheme for a photographic survey of England by counties, with the view of securing permanent photographic reproductions of all objects of archæological interest. It is intended to organise a service of amateur photographers who would undertake to do the work in the area assigned to them, and to prepare three photographs of each object—one for the county society or museum, one for the Society of Antiquaries, and a third for the British Museum. A committee was appointed to consider the scheme, which, if well carried out, ought to yield splendid results,—a similar body, under Birmingham inspiration, is carrying out excellent work in Warwickshire. I do not know if it is finally decided to confine the reproduction to photography. Of many objects, good sketches or measured drawings would prove much more satisfactory records than photographs, especially those dear to the amateurs—

> Who only need the button press,
> And we do all the rest.

I suppose it was the Duke of Devonshire's speech about the retrenchment on the part of the great landowners that would be necessary in consequence of the Budget which revived the rumour that Devonshire House, in Piccadilly, had been sold to a syndicate of speculative builders. The duke has not parted with it, and it is said that he has no intention of selling it. The house is upwards of 150 years old, and did not cost more than £20,000 when it was built; and yet the speculative builders were said to have given three-quarters of a million for it. I fancy that sum would tempt even the Duke of Devonshire! The house has nothing in its architectural or external appearance to make it remarkable. The original mansion which stood on the site was taken down by the first duke, and another was built in its place. This new house was, however, destroyed by fire, and was succeeded by the one which is now the present duke's town residence.

Land seems to become worth less day by day. The season at the London Auction Mart, where large estates are generally brought to the hammer, came to an end with last week, and the prolonged period of great depression which has existed cannot be recorded as having come to a close with it. Not one of the single properties exposed on the last day of the sale changed hands. The season which has just terminated has been remarkable for the large number of great properties which were exposed to sale and for the extremely small number which were purchased. Few persons would give the reserve prices asked, the Budget to some extent being accountable for this result as well as the discouraging condition of agriculture. The properties which had to be withdrawn are now, in many instances, objects of private negotiation. The next season will not open till some time in September, and, though there will be a few casual sales or attempts at sale in the interval, no great property will be put upon the market. For September, however, a considerable number of large estates are being advertised already.

The addition to what used to be the Chapel Royal in Whitehall, for the accommodation of the United Service Institute, is now being divested of its scaffolding. It will have cost somewhere about £16,000, and, on the whole, the money's worth is there. It is not inharmonious with the famous building to which it is an appendage, though no attempt has been made at actual assimilation. It was thought better to adopt a design which did not challenge comparison with Inigo Jones's work, and though the old and the new have some features in common, they are essentially distinct. The turret surmounting the new structure as it stands has no very obvious meaning. It is said that it was intended to be the base of a flagstaff. At present, however, it seems doubtful whether it will be used for that purpose. A good deal remains to be done in the interior of the building, but it is believed it will be ready for opening in November.

The Select Committee on House of Commons Accommodation finished its labours on Tuesday. The result does not amount to much. In spite of Colonel Howard Vincent's protest against Mr. Herbert Gladstone's clause "that it is undesirable to build a new House of Commons or to enlarge the present one," the paragraph was adopted by a bare majority—possibly in view of the coming happy time when the exodus of the Irish members will leave room for the rest. The rest of the recommendations are of the usual tinkering character. Dining-room accommodation for thirty more members is to be provided by the appropriation of three of the Peers' ground-floor terrace rooms. The space available for the Press is held to be quite inadequate, and the defective ventilation resulting from the overcrowding is dwelt upon. Two entrances to the reporters' gallery, one at each end, are recommended in lieu of the present central entrance, the necessary changes entailing a considerable rearrangement of the apartments of the officials. So long, however, as Sir Reginald Palgrave remains Clerk of the House, no disturbance of existing arrangements is to be allowed; but the committee consider that on the next appointment the question of taking the residence for the use of members and the Press should receive attention.

CLAY FOR PUDDLING.

IT is a mistake to suppose that a pure and tenacious clay makes the best puddling. An authority writing in *Indian Engineering* observes: "No high degree of purity is at all essential to insure complete imperviousness, and tenacity may under certain circumstances prove a distinct drawback." As the brick manufacturer and potter add sand or powdered flint to the clay in order to prevent cracking in the kiln, so the clay for puddling should have sand, as it is liable at times to become dry from evaporation and the heat of the sun. It is all the better for not being too tenacious, as if too much so it is liable to open in large fissures. "A roll of clay;" the same writer says, "about 1ft. long by 1in. in diameter should support its own weight when held suspended." Greater tenacity than this is objectionable if the puddle is liable to be dry at times; but if the situation prevent evaporation from the clay, a high degree of tenacity can only act favourably on the construction. Attention to these conditions is necessary to prevent failure of docks, reservoirs, and tanks constructed in porous soil.

ROYAL ACADEMY ARCHITECTURAL SCHOOL.

ADMISSION OF STUDENTS—JULY, 1894.

UPPER SCHOOL.—C. R. R. Clarke, W. H. Hazell, G. J. J. Lacy, T. G. Lucas, A. W. Newman, A. A. Reeve, T. A. Sladdin, G. Weald.

LOWER SCHOOL.—H. Budden, F. Chatterton, A. George, A. Stratton, J. Watson.

◆

The parish church of St. Mary Magdalene, Launceston, has been reopened after restoration and reseating, carried out at a cost of about £3,000, from plans by Messrs. Sedding and Wilson. The south aisle now includes a side chapel, in which a reredos has been placed, the remainder of the south aisle and also the north aisle being seated with chairs. The centre aisles are fitted with oak benches with carved emblematical ends, whilst the choir stalls are of the same material, but carved in more elaborate style. The oak seating and carving was intrusted to the firm of Messrs. Charles Trask and Sons, Stoke-under-Ham, Ilminster; the masonry work has been carried out by Mr. William Burt, of Newport, Launceston. The building has been heated with hot-water apparatus, Mr. William Prockter, of Launceston, having executed the work. The oak pulpit of carved oak has been lowered.

The first section of the public park for Hanley was inaugurated last week. The park is situate at Shelton, and will contain eighty acres. This area is practically divided into four parts—into an upper and lower portion by the Cauldon Canal, and into eastern and western portions by Victoria-road. The laying out of the park was intrusted to Mr. T. H. Mawson, landscape gardener, Windermere. A conspicuous feature will be a lake, covering five acres, in connection with which there will be cascades and rustic bridges. At present only one section of the park has been opened to the public. On the Stoke-road side, there has been constructed a main entrance, with ornamental gates surmounted with the borough arms, and with a lodge, in the Elizabethan style, constructed of red brick, half-timbered, and ornamented with terracotta. In a circle facing the entrance a fountain, standing 18ft. high, and 22ft. across the base, is placed.

OBITUARY.

MR. HENRY PETER HORNER, architect, of Paignton, Devon, died on Thursday, the 2nd inst., at his residence, 4, Southfield, in that town, at the advanced age of 77 years.

AUGUSTE CAIN, the celebrated French sculptor of animals, died on Monday, in his seventy-third year. He was the favourite pupil of Rude, and made his *début* at the Salon in 1846. Among his great works are the equestrian statue of the Duke of Brunswick for the town of Geneva; a group representing a lion killing an ostrich, now in the Luxembourg Gardens; colossal groups of a tiger attacking a crocodile, and of a rhinoceros attacked by tigers, placed in the Tuileries Gardens; the lions of the new Hôtel de Ville at Paris; the lioness carrying away her young, and the groups of dogs executed for the Château de Chantilly and for the Gardens of the Elysée Palace.

CHIPS.

Messrs. Nicholson and Co., of Worcester, are now erecting in the large lecture theatre of the Midland Institute at Birmingham a new organ. The total cost, including oak case, designed by Messrs Martin and Chamberlain, will be £1,200. The instrument has two fronts, each filled with 16ft. open plain metal pipes. The total number of pipes at present in the organ is 1,812; the number when fully completed will be 2,160.

The Manchester School of Art has accepted from an anonymous donor the promise of a replica of the tapestry known as "The Adoration of the Kings," designed by Sir E. Burne-Jones, and to be executed by Mr. William Morris.

In Paisley Dean of Guild Court, on Friday Daniel Gold, builder, was fined in £15 penalty for failing to erect a tenement in Thread-street, in conformity with plans passed, the terms of the Police Act, and the building rules.

The following have been elected to office in the Joiners' Company for the year ensuing:—Master, Sir Albert Altman; Upper Warden, Mr. George Charles Bames, St. Alban's; Renter Warden, Mr. Thomas Murray Jones, Aldersgate-street.

A building grant for Aberystwith College was asked for by a deputation which waited on Tuesday upon Sir William Harcourt. Money is required for three objects—the completion of the college building, and the liquidation of a debt upon it and the erection of a hall of residence for women students. The Chancellor of the Exchequer promised to grant £10,000 on condition that another £5,000 should be subscribed by the inhabitants of the district within two years.

At St. Peter-in-Eastgate Church, Lincoln, a number of improvements have just been completed, including the addition of two vestries at the north-west angle of the church and a western narthex with open-timbered roof. The architect was Mr. W. Watkins, and the builders were Messrs. Pattinson and Ruskington, the outlay having been £750, in addition to a new electric organ, built by the Hope-Jones Co., Birkenhead, at a further cost of £815, in an organ chamber provided on the site of the former vestries.

A commencement is at length about to be made with the Exeter, Teign Valley and Chagford Railway scheme. The line will connect Exeter with the Teign Valley system already opened, a distance of eight miles, and will be continued to Chagford, a further ten miles. This second part of the line throughout its entire length follows the course of the river Teign. Both sections will be constructed as single lines, but on the first eight miles from Exeter to the Teign Valley Railway sufficient land will be purchased and over-bridges constructed for a double line. The contract for construction has been let to Messrs. James and John Dickson.

An inquiry was held at the Town Hall, Ipswich, last week, before Col. J. O. Hasted, R.E., Inspector, acting on behalf of the Local Government Board, into an application from the Ipswich Town Council for loans of £14,500 for works of sewerage and sewage disposal, £1,650 for street improvement, and £600 for the improvement of the Cattle Market. Evidence in support of the proposals was given by Mr. E. Buckham, who has held the office of borough surveyor for the past 23 years, by Mr. Isaac Shone, of London, and by Mr. E. R. Turner, M.Inst.C.E., chairman of the sewerage committee of the corporation.

The town council of West Hartlepool considered, on Tuesday, the recommendation of the committee that the plans by Mr. H. A. Cheers, of Twickenham, selected in the recent competition for designs for the Technical Schools, be carried out at an estimated cost of £12,000. Considerable opposition was offered to the outlay by certain ratepayers, and after a discussion a decision on the matter was adjourned for four months.

Building Intelligence.

Aston.—The memorial-stone of a new infirmary now in course of erection at the Aston Workhouse, Gravelly Hill, was laid last week. The new building, which is being erected at a cost of £10,000, will afford additional infirmary accommodation for 162 patients. The new infirmary will correspond in length to the two previous erections, being 224ft. long. It will include six large wards, each 84ft. by 24ft., with space for twenty-five beds and six small wards, each with space for two beds. A nurse's duty room, with cooking grate, food safe, and sink, is to be provided at the entrance of each ward, with inspection window overlooking the ward. A stone staircase is placed in the centre of the building, which serves both wings, and communication to the wings will be obtained by a corridor from each. On either side is cross-ventilation, so as to prevent the admixture of air in the wards. The wards will be heated by hot-water pipes, and fireplaces will also be provided. There will be 941c.ft. of air space for each inmate.

Birmingham.—The accommodation in the Birmingham and Midland Eye Hospital is being enlarged by thirty additional beds. The extension will have a frontage to Edmund-street in conformity with the details of the existing building. Separate accommodation will be made for children, as well as further accommodation for the nurses and servants, and the lavatories and baths will be reconstructed. The new accommodation for the children consists of a large ward for eighteen girls and young children, a ward for eight boys, a ward with three beds for ophthalmic cases, and a spare ward, and there will also be a day-room, ward kitchen, linen-room, lavatory, and bath-room, &c. Accommodation for ten nurses and six servants will be provided on the upper floor. The total cost of the work, exclusive of the furniture, is £4,587, and the contract has been taken by Messrs. J. Harley and Son, Smethwick.

Canning Town, E.—A new public hall, erected for public and municipal purposes in South West Ham, from the design of Mr. Lewis Angell, the borough engineer and architect, was opened last week. It includes two main floors, and has a façade of 73ft. to the Barking-road, the height from the ground to the top of the pediment being 73ft. The building is Classic in character freely treated, the materials used being red brick and carved Portland stone, and is in harmony with the public library adjoining, opened last year, of which building Mr. Angell was also the architect. The entrance-hall and corridor are laid with Venetian mosaic by Messrs. Diespeker and Co, of Holborn Viaduct. On the left side of the ground floor is the minor hall, 49ft. by 24ft. On the right side of the main corridor are situate public offices, and a committee-room, 28ft. by 18ft., is provided at the end of the corridor. Prisoners' cells and waiting-rooms are provided at the end of the building in the event of a police-court being held. The large hall on first floor is 80ft. by 50ft. on the floor line, with a height of 35ft.; the gallery and stage add 38ft. to the length. The hall will comfortably accommodate about 1,200 persons. The hall is approached from the right and left of entrance-hall by staircases, also by two staircases at back. An emergency exit and external staircase are also provided on either side of the centre of the hall. The front gallery is approached by two separate entrances and staircases. The contractor is Mr. Abram Kellett, of Willesden, whose tender was £17,984. The work has been carried out under the immediate supervision of Mr. H. Shaw as chief architectural assistant, and Mr. J. M. Jefferson as clerk of the works.

Clifton, Bristol.—A grand pump room and spa have been built on Sion Hill, Clifton, and were publicly opened last week. Mr. G. Croydon Marks, of Birmingham, was the architect, and Messrs. Philip Munro and Son were the engineers. The front elevation of the Pump Room faces the Leigh Woods, and is Greek in character. The material is Bath stone, with a deep moulded plinth of blue Pennant stone. In the centre is a portico, 20ft. by 12ft., supported by six Doric columns, and beneath the portico and over the main entrance is a canopy, supported on carved trusses, again upheld by life-sized Caryatides. The portico and alcove are paved with marble mosaic, and the doors, windows, and woodwork in the pump room are oak, likewise the floor laid for dancing. The pump room interior measurement is 100ft. in length by 57ft. in width, while the panelled ceiling is 27ft. from the floor. The general contractor was Mr. A. J. Beaven; the marble was supplied and fixed by Messrs. Lee Brothers; the stained glass by Messrs. Bell; the heating arrangements by Messrs. T. Harris and Son, Wine-street; and the carving was executed by Mr. J. P. Steele—all of Bristol. Adjoining the Pump Room is the Clifton Hydro, containing, in addition to bedrooms and private suites of apartments, a general dining-room, 52ft. by 24ft., and also a drawing-room, 50ft. by 24ft., and to the right is a suite of Turkish baths.

Edinburgh.—Plans are shortly to be presented in Edinburgh Dean of Guild Court for extensive alterations on St. Patrick's Roman Catholic Church, Cowgate. The building, then used as a Presbyterian place of worship, was acquired by Bishop Gillis in 1855, since which time it has retained its old form. Its sombreness, however, has been relieved by frequent decoration and slight internal improvements. Now it is proposed to remove the gallery, except a portion on the south side under the tower, to be used as an organ loft. To make up for the loss of sitting accommodation thus brought about, the lobbies and staircases will be removed, the present chancel, used merely as a Lady altar, and the large area, so set free, furnished with pews. Accommodation is to be found for the principal altar and for side chapels on the north side, the porch on the west will be converted into a bapistery, and a covered way is to connect the presbytery with the church. The plans also provide for the erection of box confessionals in place of the rooms now used for that purpose, for the admission of more light by the gallery windows, and for the construction of a staircase on the south leading to the choir. It is estimaied that the cost will reach about £1,000, and that the work will be completed by the beginning of winter. The architects are Messrs. Buchanan and Bennett, George-street, Edinburgh.

Higher Tranmere.—A King memorial chapel, added to the Birkenhead workhouse at Higher Tranmere, was opened by the Bishop of Chester last week. It has been built from designs by Mr. J. Francis Doyle, of Liverpool, and is Late Gothic in style. It is seated with open pitch-pine pews for about 300 worshippers, and consists of a nave 63ft. by 24ft., north and south transepts each 14ft. 6in. by 9ft., chancel 20ft. by 18ft., and a vestry 9ft. by 10ft. The roof is of plain pitch-pine, unvarnished. The transepts at the junction of the roof with the nave are curiously wrought out with cambered beams deeply moulded, and supported on carved corbels of red sandstone. The chancel has all its fittings and choir-stalls worked out of ash timber. The floor is laid with wood blocks, the chancel being tiled, and the sacrarium laid with encaustic tile. The font is the old one from Oxton Church, reworked and slightly reduced in size. Externally the church is built of grey brick and red stone to harmonise with the main building, of which it is now a part. The roof is slated with Bangor slates. Mr. John Thomas, of Oxton, was the general contractor, and Mr. Samuel Gunning the clerk of works.

Liverpool.—The memorial stone of a new Welsh church, dedicated to St. Deiniol, and situated in Upper Parliament-street, was laid on the 2nd inst. The building will be in the Early English style, carried out in local grey brick, with Runcorn stone dressings, and will consist of nave, aisle, and chancel, with the usual vestry accommodation. The contract for the erection of the church, which will contain sittings for 300 persons, is £1,430, the work being carried out by Messrs. Patterson and Son, Soho-street, from the designs and under the superintendence of Messrs. Richard Owens and Son, Westminster-chambers, Crosshall-street, Liverpool.

Newcastle-on-Tyne.—The Eldon dining hall and grill-room, Grey-street, Newcastle, was reopened yesterday (Thursday), after having been closed for more than two years, owing to the failure of a roof. The interior of the building was then completely taken out, and the front rased to the ground. The building, which is five stories in height, has been re-erected by Messrs. Walter Scott and Co., Limited, from the designs of Messrs. Oliver and Leeson, architects, Newcastle. The panelling in the dining hall is in the style of Louis the Sixteenth, the delicate colourings which were in favour at that period being employed. The decoration and upholstering have been carried out by Messrs. Robson and Sons, Northumberland-street. The ceiling is decorated with embossed tapestry, and the floor is laid with Lowe's patent pitch-pine blocks.

Oban.—The new church which occupies the site of the old parish church of Oban, built in 1821, has just been opened. It is Norman in style, and covers an area of 91ft. by 45ft. There is a tower and spire, rising altogether to the height of 110ft. The lighting is effected by six windows on each side, glazed with cathedral glass in tinted shades in lead lattice-work. Over the pulpit there is a three-light window of cathedral glass. The walls are built of bulb-faced Ben Cruachan granite, with dressings of Giffnock freestone, and the tower and spire are built entirely of Giffnock freestone. The accommodation of the body of the church is for 450 people, and the gallery 110—making a total of 560. The seats are of pitch-pine. The pulpit has carved capitals, bases, and columns, and stairs leading up to it on each side. The ceiling has been painted a sky-blue tint, and is coved from the wall with hammer-beam principals. The architect of the church was Mr. Alex Shairp, Oban, and the contracts were carried out by the firm of Messrs. D. and J. Macdougall, Oban.

Shaldon, Devon.—The new Church of St. Nicholas, Shaldon, was recently dedicated. For some years there has been a church at Ringmore, about half a mile from Shaldon; but it became in such a dilapidated condition, and the ventilation was so bad, that it was decided to abandon it for public worship and build a church at Shaldon. The church, which has cost £3,000, is 105ft. in length and 50ft. in breadth, giving seating accommodation for 450 persons. The walls are of red sandstone, and the windows of Polyphant stone. The roof is a temporary one of iron. The organ which did service at Ringmore has been removed to Shaldon, having been rebuilt by Mr. H. Ivey, of Newton Abbott. Mr. Edmund Sedding, of Plymouth, is the architect, and Mr. R. J. Blowey, of the same town, the builder.

Sheffield.—The hospital and dispensary, built in 1858-60, and enlarged in 1870, is now being reconstructed, at a cost of £50,000, on an enlarged site between West-street and Eldon-street, containing 5,900 square yards. The first section of the work, the eastern block forming one-third of the entire scheme, is now in hand, and is nearing completion. This block, over 170ft. in length, has a basement story, in which will be good storage room, workshops, and lavatories, and a staff room; also lavatory accommodation for the out-patients, with direct approach from the waiting halls above. There are a drying closet, boiler and engine-rooms, coal stores, &c.; and in the western wing, owing to the rapid fall of the ground, a chapel and also an entertainment room are provided. To the rear will be the mortuary and laundries, and a covered approach to the Nurses' Home. The ground floor facing Westfield-terrace is devoted to the out-patients' department. There are a waiting-hall for 150 dispensary patients, an accident room, an electrical room, and rooms for dental work. These rooms are 15ft. high from the floor to the domed concrete ceilings. To the right is the administrative department, with porter's residence, matron's office, and tradesmen's entrance; a hall and main staircase, board-room, with secretary's office and other accommodation. To the left are two wards, 29ft. wide, for 18 and 16 beds respectively, and close at hand private wards, ward kitchen, wardrobe, and sister's room. At the extreme ends are blocks for lavatory and w.c. accommodation. The first and second floors are devoted to the accommodation of in-patients, and are arranged on the same general lines. On both floors the main corridor, about 280ft. in length, separates the front rooms from the wards. On the first floor is a ward for boys, containing 18 beds; a centre ward of 18 beds for men's surgical cases, and between it and the 16-bed ward for women is placed the operating theatre, with students' gallery. Across the corridor are special wards and matron's rooms, and on the other side rooms for the resident medical staff, clinical, and microscopic rooms. On the second floor, to the east, is situated the children's ward (18 beds); in the centre, the men's medical ward (18 beds), and to the west the women's medical ward; a ward for special cases, and nurses' dining-room, and wards for ophthalmic patients. These are all 13ft. high from floor to ceiling. The floors are constructed with English steel girders and cement concrete, covered with polished teak block herring-bone boarding, laid in bitumen, and with marble terrazzo pavement. On the top floor in the centre block are the kitchen, servants' hall, and bedrooms for the servants. The building is designed in the style of the English Renaissance. The principal fronts are faced with thin bricks, with dressings of Weldon Wood stone. The elevations to the courts are of local bricks. The basement story is faced internally with local Stand Hills stone. The floors and roofs are constructed with Siemens-Martin steel girders, imbedded in cement concrete, and the flats covered with asphalte. The block now nearing completion has been executed in two sections, the basement story and the superstructure. The following contractors are employed on the works:—Mr. P. Molloy for the excavation, Mr. George Webster for the masonry and brickwork, Mr. Higgins for the plastering, Mr. H. Waddilove for the plumbing and glazing, and Messrs. J. and J. Rodgers for the painting, all of Sheffield. The Phœnix Fireproof Flooring Co., Manchester, have the the contract for the concrete flooring and girders, and Messrs. John Tomlinson and Son, of Leeds, for the joiners' work. Mr. H. Harlow acted as clerk of works until his retirement from ill-health, and has been succeeded by Mr. H. Buchanan. Mr. J. Webster is the masons' and general foreman. Mr. Hadfield, of the firm of Messrs. M. E. Hadfield, Son, and Garland, architects, of Old Club Chambers, has designed the building, and is directing the work.

Stafford.—The building committee of the Staffordshire General Infirmary recently met for the purpose of examining the tenders for building the new south wing, children's wards, and the reconstruction of the administrative and centre block. Tenders were received for the general work from Messrs. Foster and Dicksee, Rugby; Willcock and Co., Wolverhampton; John Bowen, Birmingham; A. F. Whittome, Stafford; Henry Lovatt, Wolverhampton; and John Gethin, Frankwell, Shrewsbury; and for the plumbing work from Messrs. Dent and Hellyer, London; Messrs. Corcoran and Son, Scarlett Bros., and Thomas Till, Stafford. The tender of Mr. John Gethin, being the lowest, amounting to £9,051, for the general work was accepted.

Wolverhampton.—The foundation-stone of the new chapel to be erected in the grounds of the Orphan Asylum, Goldthorn Hill, was laid on the 2nd inst. by the Earl of Dartmouth, with Masonic honours. The chapel, which is being erected by Messrs. H. Willcock and Co., builders, Darlington-street, Wolverhampton, from designs by Mr. F. T. Beck, architect, also of Darlington-street, is cruciform in shape, 100ft. long, 50ft. wide across the transepts, and 25ft. across the nave and choir. The height is 45ft. It is in the Tudor style, and will harmonise with the existing buildings. It is arranged with nave, chancel, and two transepts, and will provide seating for 400 persons. The organ will be placed in the north transept. The materials used for the exterior are pressed faced bricks, relieved with diaper work and stone dressings, to match the existing buildings. Internally, the walls will be finished in stucco, relieved with stone quoins and bandings, the upper part of the chancel walls being faced entirely with stone, and the lower part stuccoed, which will admit of future decoration in frescoes or mosaics. The floors of the aisles are to be laid with tiles of special design, and the floors under the seats with wood blocks. The seats and other fittings will be of red deal or pitch-pine. The reredos is to be of oak, as also the Communion-table, pulpit, and choir-stalls.

At Monday's meeting of the School Board for St. Thomas-next-Exeter, the clerk reported the total cost of the Okehampton Board Schools at £4,682 8s. The claim of the contractor was for £5,190 5s. 4d. The matter was referred to arbitration, and the award fixed the amount at £3,551 2s., and disallowed £1,639 3s. 4d.

The Castle at Norwich, for many years used as a prison, has been acquired by the City Corporation, and is being fitted up as a museum. It will be opened by the Duke and Duchess of York in October.

The memorial stone of a cottage hospital for Crewe was laid last week. Mr. J. Brooke is the architect, and Mr. J. Gethin the builder.

The Earl of Rosebery, who presented the swimming bath to the People's Palace some years ago, has now offered to add a number of washing baths at a cost of £500.

Engineering Notes.

Newcastle-on-Tyne.—A party of student members of the Institution of Civil Engineers were shown on Friday over some of the extensive works in course of construction for the North-Eastern Railway Co., and intended to facilitate the traffic to and from Newcastle. At the invitation of Mr. Charles A. Harrison, engineer to the North-Eastern Railway (who is the president for the year), and under his guidance, the party proceeded by train to Pelaw, and walking thence to Felling, they inspected the works that are in progress there for the widening and straightening of the line; and then proceeding by Gateshead to Newcastle, they passed on to the inspection of works of a different character, but with the same object—the widening of the line from the Manors to the High-Level approaches. The party—including Mr. D. Shanks, of Glasgow, contractor for the Pelaw and Felling widening works, and Mr. Stewart, the resident engineer—made an examination of the works on the section, which extend over 1¾ miles, and which will, when completed, provide four, in lieu of two, lines of way. On these works of widening and straightening 300 men are employed, and good progress has been made since the commencement of the works —about four months ago. The old station at Pelaw Main is to be replaced by a new one, on the island plan; and goods-yards will also be provided at Pelaw. Felling Station will become a duplicate of the new one at Pelaw, and will occupy what is now the goods-yard; whilst a new goods-warehouse will be placed further west. A large warehouse at Gateshead is also nearly finished. The plans for the widening from the Manors to the Castle were produced, and explained by Mr. Harrison and Mr. Bulmer. For this section of the work, which includes the rebuilding and widening of the Dean-street bridge, Messrs. Walter Scott and Co., of Newcastle, are the contractors. The cost of the works for the widening from Pelaw to Felling is £50,000; and for the shorter, but heavier, masonry work from the Castle to the Manors, may be also put at £50,000—exclusive of the cost of the land in each case.

CHIPS.

A memorial Primitive Methodist chapel which has been erected in Cemetery-road, Southport, was opened on Wednesday week. The cost has been £1,600.

The Penistone board of guardians have instructed their architect, Mr. Wild, to prepare plans for an extension of the workhouse infirmary.

The half-yearly report of the Midland Railway Company states that good progress has been made during the past half-year with the works for widening the main line between London and Bedford. The whole of this widening will probably be completed and ready for traffic early next year, thus providing four continuous lines from London to Glendon Junction, a distance of 75 miles.

The foundation-stone of the Verdin technical and intermediate school at Winsford was laid on Saturday by the donor, Mr. Joseph Verdin. The schools are being built from designs by Messrs. Woodhouse and Willoughby, of Manchester, Mr. James Fowles being the contractor.

The free public library at Airdrie, N.B., was formally opened on Friday. It has been built from plans by Mr. Arthur, provost of the burgh.

Alderman James Weeks Szlumper, M.Inst.C.E., the Mayor of Richmond, Surrey, upon whom the Queen has conferred the honour of knighthood, is 60 years of age, and has been specially identified with railway enterprises. He laid out and constructed the Manchester and Milford, the Pembroke and Tenby, the Whitland and Cardigan, and the Barry and other lines. He is justice of the peace for Cardiganshire, Surrey, and Richmond. For several years he has occupied a leading position on the local governing body of the latter town.

Mr. Walter Bird has been elected the master of the Tylers and Bricklayers' Company, with Mr. Augustus Henry Bird as the upper warden, and Mr. George John Newson as the renter warden.

New South Wales is, says the *Australian Building Journal*, to a certain extent ahead of England in its regulations as regards plumbers, at all events with those over which the Water Supply and Sewerage Boards have jurisdiction, as they have not only to be registered, but also to pass an examination, whilst the passing of the Plumbers' Registration Bill is still in the stage of being "hoped for" in England, although there is a system of permissive registration.

Correspondence.

LITTLEBOROUGH LOCAL BOARD OFFICES COMPETITION.

To the Editor of the Building News.

Sir,—Mr. Wild, Clerk to Littleborough Local Board, informs me he has forwarded you the result of competition for Local Board Offices, &c., but he has only given the names of the 1st and 2nd, although the assessor has awarded the third place to myself.

He requested me to write you and ask you to give my name as the third in order of merit. Will you kindly do so in your report?—I am, &c.,

Chas. T. Taylor, A.R.I.B.A.,
10, Clegg-street, Oldham.

DARLINGTON PROPOSED NEW SCHOOL COMPETITIVE DESIGNS.

Sir,—My attention has been called to a paragraph in your last issue referring to these designs and stating Mr. E. R. Robson, architect, London (to whom the designs had been submitted by the school board), had placed them in the order given in your paper. Mr. Robson did not place any other plans in order of merit beyond the 1st and 2nd. I think, in fairness to the other competitors, this letter should appear in your next issue.—I am, &c.,

F. T. Steavenson, Clerk to School Board.
Darlington School Board, Clerk's Office,
August 8.

MR. NORMAN SHAW'S SYSTEM OF HOUSE DRAINAGE.

Sir,—I believe there have been many houses in London and suburbs (erected in the so-called "Queen Anne" style) drained by a system of open heads to the soil-pipes into which the lead bend from the w.c. discharges. It would be of interest to many of your readers if the owners or agents of some of these houses would give their experience of it.

I am surveyor to some property of the kind built under well-known architects upon a Crown Estate, and during the last 10 years have done away with the brick cess-pit at the foot of soil pipe with its open grating, and substituted a siphon trap, so that the only other past complaints were of the slopping over of water, in cases where the lead bend from w.c. was not low enough into the hopper, which defect was easily remedied.

The chief point, now, is that the sanitary authority of this Metropolitan district has served notice upon me to abolish the whole thing, and substitute close soil-pipe, and vent of full bore for the open hopper-heads, on the ground that a *nuisance* has been proved to its satisfaction to exist, although neither complaint nor illness has occurred. The work has to be done within 14 days.

If any similar action has been taken by any vestry or district board in the past within the knowledge of any contributor to the Building News, particulars and result would be acceptable, inasmuch as these local boards, where the sanitary committee is often composed of members who know nothing of sanitation, are pushing matters to extremes under the Public Health Act, at the instance of their officers; all which action on their part practically goes no small way towards the confiscation which finds too much encouragement at this *fin desiècle* date.—I am, &c.,

August 1. E. W. Hudson, F.S.I.

VENTILATION OF SEWERS.

Sir,—I am glad to see some correspondence in your columns upon this important question, especially so as the campaign has opened by a condemnation by a medical officer of high standing and a surveyor of long experience, of those 19th-century abominations, "sewer gratings in the roads." What I desire to urge is, that whether these gratings allow the escape of disease germs, as your correspondents imagine, or whether they allow the escape of a most sickening vapour containing a large excess of carbonic acid, as recent investigations show, it must surely be obvious to every thinking man that sewers ventilated into the streets are ventilated in the *wrong place*, as it is in these very streets and in the atmosphere thus polluted that the inhabitants of our large towns are obliged, not only to move about in the performance of their daily duties, but their dwellings obtain their air supply largely from the same scientifically-polluted source, the extent of the pollution varying, of course, according to atmospheric condition, and being greatly augmented by a heavy rainfall following a period of dry weather, when millions of cubic feet of the noxious air of the sewers of towns must be absolutely displaced and driven direct into the often foggy or moist, still atmosphere of the roads and streets, to form for days, perhaps, the breathing air for the population.

When will our leading sanitary engineers, medical officers, and sanitary boards have the courage to break away from this almost universal but obviously unsanitary way of sewer ventilation? And when will the County Council of London set an example to other municipalities by so doing?

One word with regard to the recent letter of Mr. Hurst, who appears to be opposed to ventilating sewers into the open air at all, on the ground of the objection raised by Dr. F. W. Clark in his report (noticed in the Building News of the 13th inst.)—viz., "that the less the movement of the air of sewers, the fewer disease germs will be carried into the outer air."

The recent "sewer air investigations" made by Mr. Parry Laws, F.I.C., for the Main Drainage Committee of the London County Council (which fully bear out the previous investigation of Drs. Carnelly and Haldane), show, I think conclusively, that the number of micro-organisms are less in sewer-air than in the outside air at the same time, and are related to the latter and not to the micro-organisms of the sewage. The conclusion arrived at by Mr. Parry Laws is that the organisms found in sewer air "probably do not constitute any source of danger."

It is, however, clearly shown in these investigations that sewer-air contains a large excess of carbonic acid, and it is suggested that it may contain "some highly poisonous chemical substance, possibly of an alkaloidal nature, which, though present in but minute quantities, may, nevertheless, produce, in conjunction with the large excess of carbonic acid, a profound effect upon the general vitality." Mr. Hurst, in his letter, condemns sanitary engineers for availing themselves of the "assistance of the wind and induced currents of air" to ventilate sewers; but do not the important and able investigations above referred to show the absolute necessity of a much greater and much more regular and scientific method of diluting sewer-air with fresh air than is obtained by the present system of vertical shafts at intervals along the sewers, opening either into the roads or above the roofs of houses? Surely the excess of carbonic acid in the sewer-air should be lowered, and the air thus be made and kept purer in the sewers, and rendered more fit to be discharged in selected positions into the open air. Speaking from practical experiments which I carried on for many months on a section of a large main sewer, I feel convinced that such a result can be obtained, and at a comparatively small outlay; but reliable means must be adopted to secure constant, but gentle, air currents in the sewers, independently of the wind, which, however, can be utilised when it has sufficient force. Checking the rush of air through the sewer by the insertion of cotton-wool filters in the street shafts, which your correspondent, Mr. Buck, says the city engineer of Worcester has decided to adopt, will not, I imagine, tend to reduce the excess of carbonic acid in the sewer-air. It appears to me to amount to a partial blocking-up of the existing defective, but necessary, system of admitting fresh air into the sewers.—I am, &c.,

Archibald H. Ford, Assoc.Mem.Inst.C.E.
High-street, Portsmouth.

Sir,—Dr. Clark and your correspondents give expression to thoughts which must have crossed the minds of many sanitary surveyors while engaged in carrying out sanitary schemes involving the recognised system of ventilation. Fashions obtain in sanitary science as in other matters, and the hermetically sealing of sewers has been followed by the other extreme of inducing air currents through them, and the discharging of the noxious gases thus manufactured against our dwellings, either through inlet gratings beneath our noses, or up shafts next our bedroom windows. Ventilating-pipes capped by air-extractors of every design emitting foul odours disfigure our houses on every side, so that the Eastern patriarch would not now find our modern housetops a savoury resting-place in the cool of the evening. But I venture to think that Dr. Clark's practical proposals do not logically follow his theoretical conclusions. He says, "we must be content to provide small outlets here and there at high elevations which shall act solely as safety-valves"; and then he goes on to propose an outlet-pipe from the sewer at every house, and in some cases dispenses with the intercepting trap; the result being that some of these so-called outlet-pipes will act as inlets, and will thus create the draughts through the sewers which he wishes to avoid; and, moreover, being connected direct to the sewer, will transmit sewer-gases up the house soil-pipes. It seems to me these proposals would aggravate, rather than lessen, the evils of the present system.

To give practical form to the conclusions of Dr. Clark and your other correspondents, we appear to require some radical alterations. We do not want to induce air currents through our sewers or drains, therefore all inlets should be abolished. On the other hand, as we do not want sewer-gas brought to our houses, the intercepting trap, required under by-law 56, should in all cases be retained, and the open end of a soil-pipe, or even a small pipe taken up from a soil-pipe, would be sufficient safety-valve for any gases in the house drains. Now all we have to do in the sewers is to prevent such an accumulation of sewer-gas as shall force the intercepting traps, and at the same time we do not want to discharge sewer-gas near our dwellings. In small towns, a shaft taken up a tree from the flush-tank at the head of each branch sewer, would probably be sufficient safety-valve, together with another shaft as the sewer leaves the town. In larger towns some intermediate shafts might be necessary, taken up a public building rather than a dwelling-house. Practical experience would show how far apart these safety-valves could be placed; but, probably, if the sewer were free with a continuous flow through it, a distance of 1,000 yards between each shaft would not be too much.—I am, &c., Sanitary Surveyor.

CHIPS.

A marble statue of the late Mr. George Holloway, who represented Stroud in the Conservative interest from 1886 to 1892, was unveiled at Stroud on Monday. The statue is the work of Mr. T. R. Essex, a native of Stroud.

The tender of Messrs. Morgan and Evans has been accepted for an addition to business premises of Mr. E. B. Ford, in accordance with drawings, &c., prepared by Mr. Robert Williams, A.R.I.B.A., of 17, Effingham-road, S.E., and Llantrissant, Glam.

Two three-storied semi-detached villa residences are being erected on the Ashby-road, Burton-on-Trent, for Mr. T. Roadknight, from the plans of Mr. R. E. Carpenter, architect, of Burton. Mr. G. Kennard, of Stapenhill, is the builder.

During the removal of whitewash from the internal walls of Poughill Church, Devon, two frescoes have been discovered. That on the north wall represents St. Olaf, King and Martyr, and that on the south wall St. Christopher.

Miss Philippa Fawcett, the only child of the late blind Postmaster General, and who took a place above the Senior Wranglers of her year, has announced her intention to commence business as a civil engineer.

The tender of Mr. W. A. James, builder, of Cowbridge, has just been accepted for the Young Men's Institute, to be built at Cowbridge, from the designs of Mr. Robert Williams, A R.I.B.A., of 17, Effingham-road, S.E., and Llantrissant, Glam.

With the completion of the organ, the new concert hall, Henshaw's Blind Asylum, Manchester, was formally opened on Friday, when Mr. J. Pyne presided at the new instrument. This organ has been built by Mr. Wadsworth, of Manchester, the case being designed by Messrs. Heathcote and Rawle, the architects for the building. This last extension, including the large concert hall, kitchens, girls' playroom, and other accommodation, has, with the organ, cost £11,000.

At Sandon-road Wesleyan Chapel, Birmingham, a stained-glass memorial-window has been placed at the south-west end of the building. The window is of two lights, each measuring 22ft. high and 3ft. wide, surmounted by a quatrefoil. In the two upper compartments, the subjects depicted are the Resurrection and Ascension of Christ; and in the two lower, the Adoration of the Magi and Christ in the Temple among the Doctors. The canopy and base have been treated in the Perpendicular period of stained-glass work. In the quatrefoil, the Holy Ghost is represented as a dove. The work has been executed by Messrs. Swaine, Bourne, and Son, King Edward's-road, Birmingham.

Intercommunication.

QUESTIONS.

[11190.]—**Skittle Alley.**—Will some of your readers be good enough to give me a section and short rough specification for the construction of the floor of an American skittle alley?—L. H. G.

[11191.]—**Architectural Tourist.**—Are there any old examples of churches and domestic buildings to be found in Surrey, and which would be the centre most convenient for a tourist to do some sketching? Is Hampshire a good county, and what district would be most profitable? I want chiefly old work.—Tourist.

[11192.] — **Building Lines.** — In Surrey-street several new blocks and hotels have been erected of red brick and terracotta of more than ordinary pretensions. These buildings have been set back 5ft. or more from the old houses on the west side, but I observe that a newly-built hotel has a large bay window projecting some feet in advance of the bay windows to houses lately erected. May I ask what rule has allowed this greater projection from those adjoining? The case appears to be one calling for an explanation from those who have the laying down of building lines in narrow streets.—Critical.

[11193.]—**Chancel Screens.**—Are there any examples near London of chancel screens carried up to the full height of chancel arch, and, if so, are these of stone or iron?—Enquirer.

[11194.]—**Testing Drains.**—Can a vestry insist on the drains of an old house being tested? I should like to have a legal opinion, as there appears to be a difference of practice in London.—House.

[11195.]—**Ornament.**—As a student I should like to be informed whether there are any treatises on ornament that would be of service in preparing for the examination at South Kensington?—Alpha.

[11196.]—**Joints for Stoneware Pipes.**—Will a practical correspondent of the Building News give me the names of the makers of joints for stoneware pipes? Those, at least, which have been formed to give the best results in different soils.—H. D.

REPLIES.

[11183.] — **Levelling with the Theodolite.**—Although the theodolite, whether "cradle" or "transit," can be used for travelling, yet no experienced engineer would for a moment dream of making a longitudinal section with it, nor would any young engineer or surveyor be allowed by his "chief" to so employ it. It is quite unnecessary to mention its disadvantages for that purpose, which, among others, are its weight and the greater number and complexity of its adjustments and difficulty, comparatively, of setting up. I have myself used the theodolite for "putting in a level" for the foundations of a bridge, for which, with the same instrument, I had just previously aligned the two centre lines; but in this case, as in other similar instances, a B.M. was mighty handy, and one setting up of the instrument did the business, which is a very different matter from making a section many miles in length. In a word, the theodolite is not the proper instrument for taking levels, and should be neither regarded nor employed as such.—P. S. Strettonne.

Mr. George Inness, sen., the well-known landscape painter of New York, died on Friday, while staying at Bridge of Allan. No other painter has reproduced the aspects of nature in the American climate with deeper feeling, or with a better command of technical resources.

An isolation hospital containing twelve beds, together with detached administrative cottage and disinfecting chamber block, has just been completed for the Lancaster Lunatic Asylum. There are also in course of erection a new block for 70 patients employed in the estate workshops, blocks for 50 nurses and 25 attendants, and the enlargement of the women's hospital to give 37 more beds. Mr. E. Howard Dawson, A.R.I.B.A., of Lancaster, is the architect for the whole of these works, the total cost of which exceeds £20,000, the sum per bed provided being slightly under £100. The work is entirely in local hands.

The parish church at Etruria, Staffs, which suffered damage from mining operations, and has been closed for some months during repairs, was reopened on Wednesday week. Part of the walls and piers have had to be rebuilt, and they have also been braced with strong iron rods which extend across the interior of the building. The church has also been re-decorated by Mr. Bickley, of Hanley. The west gallery has also been removed. Mr. Charles Lynam, F.S.A., of Stoke-on-Trent, was the architect, and Mr. Leonard Price, of the same town, the builder.

The corner stones of the Manchester Talmud Torah School for the Hebrew education of Jewish children were laid on Monday. The buildings are being erected in Bent-street, Cheetham, and the western end of the structure will abut upon Torah-street. At present only a portion of the projected scheme is being carried out. This consists of three classrooms and a large hall, the latter being 50ft. by 20ft. It is proposed ultimately to add two wings to the school. At present accommodation is provided for from 120 to 150 children, and the estimated cost is about £1,200. The architects are Messrs. Ogden and Charleton, Spring Gardens, Manchester; and the builders, Messrs. W. Brown and Son, Salford.

Legal.

THE PURCHASE OF TRAMWAYS.

THE decision of the House of Lords upon the recent tramway cases, to the effect that a local authority when taking over a tramway need only pay a price to be arrived at by estimating its cost of construction and allowing for depreciation, is likely to have a widespread effect in the way of discouraging this class of engineering enterprise. The judgment lately pronounced is final, as matter of law, and the meaning of the statute must be taken as settled; but it may still fairly be doubted whether this was the real intention of the Legislature; while it is pretty certain that the mere possibility of such a result never occurred to those who make and who invest in tramways. It may be a good thing that tramways should be worked by local authorities, though, practically, the experiment has yet to be tried, and it is by no means certain of being successful. But whichever view may be taken of this, at all events, the present state of uncertainty will prejudice all future work of the kind, while the judgment just given will seriously diminish the value of all shares in such concerns. Some people think that a blow of this kind hits only wealthy people, but this is quite a mistake, for it falls far more heavily upon the small investor who has put his savings in a concern which he looked upon as something like a railway.

If at the end of 21 years a tramway company is compelled to sell its line, plant, &c., at the market price for such things, without anything for goodwill, and without any payment for rental value, to say nothing of compensation, which admittedly cannot be claimed, then assuredly capital will not readily be forthcoming for such ventures in the future. An ordinary person who bought tramway shares looked to get a fair income and also to have his principal money repaid him. Now he will find that, though fair dividends have been earned, his shares have fallen to pieces. It is not so easy as it looks to work up a successful tramway business, and when this has been done, and a good road made and maintained for 21 years, it seems hard that nothing should be paid for it but the old iron value of the plant. Parliament can still alter the law, and stop the harm that this judgment must cause, by passing a short Act making a reasonable compromise. Until this is done, the business of tramway construction, which is of importance to many classes, must seriously suffer, if it does not come entirely to a standstill; for though local bodies can buy up tramways ready-made and get bargains, they have no powers to lay lines or to incur expenses of this kind on their own account.

Fred. Wetherfield, Solicitor.
1, Gresham Buildings, Guildhall, E.C.

Note.—All questions for reply in this column must be headed "Building News," and must reach my offices, as above, by *Tuesday* morning to insure answer same week.

* * *

On Saturday, memorial-stones were laid of a new Wesleyan Methodist chapel situate in Irlam-road, Flixton. The cost of the building will be £635. Mr. H. M. Ward, of Manchester, is the architect.

New Technical Instruction Buildings are about to be built at Stafford for the Staffordshire County Council. The buildings will be built at the corner of Earl-street and Victoria-square, and will include offices and meeting rooms for the committee, art and science classrooms and laboratories, and cookery kitchen. The building will be two stories high, with an ornamental frontage of red brick, faced with stone. The architects are Messrs. Bailey and M'Connal, of Walsall, and Mr. H. Lovatt, of Wolverhampton, is the contractor. Mr. Lovatt is engaged in erecting the County Council Buildings in the same town.

The foundation-stones of a new Wesleyan chapel at Arthington, near Leeds, were laid on Monday. The chapel, which will be erected from plans by Mr. W. H. Beevers, A.R.I.B.A., Bond-street, Leeds, will be Early English in style. It will be built of Shipley stone, with ashlar stone dressings lined with brick. The whole of the interior fittings will be of polished pitch-pine, and the windows will be in stained glass. Accommodation will be provided for 150 worshippers. Adjoining will be a schoolroom for 60 scholars, and in addition there will be a vestry and a caretaker's house. The principal contractors are Messrs. Rhodes Brothers, Shipley. The cost is estimated at about £1,400.

LEGAL INTELLIGENCE.

Height of Corner Buildings. — The Kensington Court Case Once More.—In the Queen's Bench Division, on Friday, before Mr. Justice Mathew and Mr. Justice Kennedy, the appeal case of "The London County Council v. Worley" was heard. It was an appeal by the London County Council against a decision of Mr. Curtis Bennett, a Metropolitan police magistrate, refusing to impose penalties under the Metropolitan Management Act, 25 and 26 Vict., c. 102, s. 85, which imposes a penalty of 40s. for every day on which a building is continued of a height exceeding the width of the street, after written notice to reduce it. The ground on which the magistrate had refused to convict was that the proceeding was out of time under section 107, which says that "no person shall be liable for the payment of any penalty or forfeiture unless the complaint has been made before the magistrate within six months after the commission or discovery of the offence." The original offence in the completion of the building, at the corner of Kensington-court and the High-street, above the height allowed (without the license or leave of the Council) was on the 8th of February, 1893. The enactment (sec. 85) is:—"No building shall be erected on the side of any new street of a less width than 50ft. which shall exceed in height the distance from the front of such buildings to the opposite side of the street without the consent in writing," &c., "and every person committing any offence under this enactment shall be liable to a penalty of £5, and in case of a continuing offence to a further penalty of 40s. for every day during which such offence shall continue after notice from the Board." In April, 1892, there was notice from the Council to the builder that the building would be an offence, and this was received by the owner. In July, 1892, the building was roofed in, and the wall then was of the prohibited height, and so the offence of erection was completed. In October, 1892, there was a penal notice to the builder for the erection of the building above the height limited. In November, 1892, there was a summons against the builders for the penalty for the erection of the building. The magistrate doubted whether the case came within the enactment—i.e., whether the building was "erected" on the side of a new street, the front being in an old street and the side of the house in the new street. In June the case came before the Court, and the magistrate was overruled, and in October, 1893, there was a conviction for the penalty for the original offence, the erection of the building. In February, 1893, the building being completed, the builders withdrew. On March 1 last the Council proceeded against the owner, on a penal notice in December, to recover the penalty of 40s. a day for continuing the building, that is from December 23, 1893 (the date of the notice), to March 7, 1894. The magistrate thought the proceeding out of time, as being beyond the six months limited by the Act. The magistrate, however, stated a case, on which the Council appealed against his decision. Mr. Dickens, Q.C., contended for the owner that a proceeding should have been taken against the owner for the original offence within the six months. The Court came to the conclusion that the magistrate was wrong, and that the penalties were recoverable. Mr. Justice Mathew, in giving judgment, said he had tried to discover a doubt in favour of the building owner, but was unable to do so. The construction of the statute was perfectly clear. The offence charged against the owner was the continuance of the building after the notice, and it seemed to him clear that the penalties were recoverable. The contention was that the offence could only be continued by the party proceeded against for the original offence, the erection of the building; but that was an erroneous view, and the magistrate ought to have imposed the penalties. Mr. Justice Kennedy concurred, though, he said, not without hesitation. Case sent back to the magistrate with the direction that he ought to have convicted.

An Asphalting Dispute.—In the City of London Court, on Thursday, Deputy Judge Robins and a jury had before them the case of "The Brunswick Rock Asphalte Co. v. Church," in which the plaintiff company, whose offices are at 9, Gracechurch-street, sued the defendant for £6 for work executed according to agreement. Plaintiffs' case was that in February defendant called at their offices for a price for repairing a carriage-way, providing the necessary concrete and asphalte, &c., at Denman-street, London Bridge. A price was given of 9s. 6d. a yard, but subsequently defendant called again and asked for a price for the whole job, and a written estimate agreeing to do the work for £6 was handed him, and accepted. The work was done; there had been no suggestion that it was not properly performed; yet defendant had tendered to plaintiffs £3 18s. 6d. in settlement, and paid the money into court. Defendant's case was that he was told 15 yards of asphalting would be required, and only 7½ had been laid down. The judge said no verbal communications could stand in law against a written agreement, and there was no mention in the written estimate of any number of yards. Defendant said he would plead that he had been induced to enter into the agreement by fraud. The judge, in summing up to the jury, commented on the serious nature of the charge alleged against the plaintiff company by defendant in order that he might get behind the written agreement, and directed them that, unless they believed the company had used fraud to obtain this small order, they should find for the plaintiffs. The jury returned a verdict for the plaintiff company.

In Re Geo. Davies.—An adjourned sitting was held last week, before Mr. Registrar Giffard, for public examination under the bankruptcy of George Davies, the sole surviving partner of the firm of Aldin Brothers and Davies, builders, formerly carrying on business at the Roland Works, South Kensington. The liabilities were returned at £15,958, of which £11,269 were unsecured, with available assets £4,377, subject to preferential claims £195. The debtor ascribed the insolvency to the heavy drawings of his late partners, and the deficiency upon the trading was also accounted for by an alleged over-valuation of the assets at the time he joined the firm. The debtor stated that the business was established many years ago by Mr. Aldin, senior, who died in 1871, being succeeded by his two sons, William and Charles Aldin. He joined the firm in January, 1890, having been previously employed for about 21 years in the business. At the time he became a partner he introduced capital to the amount of £1,000 into the concern, another partner, who then retired, leaving his interest (£4,000) in the business. Mr. William Aldin died in September, 1892. Mr. Charles Aldin died in April of this year, and, through the complications which had arisen in consequence of the death of his partners, the business became crippled for want of capital. The examination was ordered to be concluded.

Re William Horrox.—At the Manchester Bankruptcy Court last week, this bankrupt—an architect—applied for his discharge. The Official Receiver reported that the receiving order was made on the 3rd May last, and according to the bankrupt's statement of affairs, the liabilities to rank for dividend were £97 15s. 2d.; and the assets, so far as they were not assigned to creditors wholly or partly secured, were estimated to produce £1. The bankrupt is an architect by profession, but acting sometimes as clerk of works; he attributed his insolvency to his inability to pay the sum of £94 15s. 2d., the amount of the taxed costs he had become liable for in an action instituted against him by Mr. W. P. Hartley, of Aintree, jam manufacturer. The bankrupt was adjudged a bankrupt in the Leeds County Court on the 13th August, 1867. Bankrupt's solicitor explained. The Judge granted the bankrupt his discharge, subject to his consenting to judgment against him for £25. In the event of the debtor not consenting, the discharge to be suspended for two years.

An Agent's Commission.—Keast v. Howard.—This action, heard in the City of London Court on the 2nd inst., before Mr. Roxburgh, assistant judge, and a jury, was brought by Mr. W. J. Keast, builder, Pratt-street, Camden Town, against Messrs. Howard Brothers, timber merchants, 109, Fenchurch-street, to recover £48 15s. 4d., commission on the sale of timber. The defendants denied the indebtedness, and counterclaimed for £4 13s. 7d., balance of an account for timber supplied. The plaintiff had acted as the defendants' agent for the sale of timber in Bedfordshire, Buckinghamshire, and Hertfordshire, his remuneration being a commission of 5s. per standard on all deals and battens sold, and 3d. a square on "matching and flooring." But, in addition, the plaintiff said he was entitled to the whole of the difference between the prices obtained from his customers and the minimum prices furnished by the defendants. His claim for commission on this basis amounted to £48 odd, and after deducting £25 8s. 9d. in respect of the timber purchased by himself, it left a balance due of the sum claimed. The defendants' version of the arrangement was that nothing was said at the time of the plaintiff's engagement, in March, with regard to extra profits, although the plaintiff might have been told in May, when the matter was mentioned, that they would do what they could with regard to it. The only commission to which the plaintiff was entitled was £20, and after deducting the price of the timber supplied, it left a balance in defendants' favour of £4 13s. The jury found that the plaintiff was entitled to 5s. per standard and 3d. per square, plus half profits on the sale prices, from the commencement of the employment. It having been agreed that only the principle on which the commission should be assessed should be tried, a formal verdict was entered for the plaintiff for the amount claimed, and for the defendants on the counterclaim, subject to a reference of the figures to Mr. Harrison.

Is an Arcade a Building or a Street?—Vestry of St. Martin-in-the-Fields v. Bird.—In the Queen's Bench Division, on Tuesday, Justices

Mathew and Kennedy heard an action brought by the Vestry of St. Martin-in-the-Fields for a declaration that the defendant, Mr. William Bird, was the person liable to execute drainage works at the Lowther Arcade, Strand. The case raised the question whether the vestry or the defendant was liable to put in order the drainage of the Arcade. The point turned upon the construction of section 250 of the Metropolis Local Management Act, 1855. The Arcade was a passage arched over by a common roof, with a range of 25 houses and shops. The vestry said it was the duty of the owner to put and keep the drainage of the Arcade in repair, while the defendant maintained that the drainage arrangement of the Arcade came within the definition of a sewer, because it drained more than one house, and that therefore it was the duty of the vestry to attend to the drainage. Plaintiffs submitted that the Arcade was a building or premises within the same curtilage, and that the sewage was carried off by a drain within the meaning of section 250 of the Act of 1855. Defendant's counsel argued that the Arcade was not a building or premises within the same curtilage as defined by the section; that the shops in the Arcade were separate dwellings, and that each of them drained into what he maintained was a sewer under the control of the vestry. Mr. Justice Mathew said, in his opinion, the vestry were liable to repair the sewer. Each tenement in the Arcade stood by itself, and was occupied as a dwelling-house, and had its own curtilage. Therefore, there would be judgment for the defendant. Mr. Justice Kennedy concurred.

A Preston Arbitration Award.—Mr. Thos. Wainwright, the umpire in the arbitration between the Preston Corporation and Mr. John Fletcher, has made his award. A claim was made by Mr. Fletcher against the corporation for damage done to his land by the laying of a sewer at Ashton-on-Ribble. The original formal claim of Mr. Fletcher was for £400 as compensation. This was amended the day before the arbitration to £1,221 13s., and this was the lowest estimate given by any of the claimant's witnesses, the highest being by Mr. Harding, who put the damage at £1,790 8s. The corporation valuers assessed the damage at from £20 to £50. The award is £323.

A Sheffield Street Improvement Arbitration.—The town clerk of Sheffield has received the award of Mr. Joseph Smith, of Bradford, as arbitrator between Messrs. G. H. Hovey and Son and the Corporation. Last Christmas Messrs. Hovey's premises were burned down, and before they could rebuild the corporation served them with a notice to set back their building-line so as to widen Castle-street and Angel-street. By the line prescribed 209sq.yds. of Messrs. Hovey's land was thrown into the street. The corporation offered £6,500 as compensation for trade losses contingent upon the compulsory restriction of the site. The total claim was for something like £21,000, and the witnesses for the corporation fixed the loss at sums ranging from £6,866 to £7,450. The arbitrator has awarded £11,706, and the corporation have to pay the claimants' costs.

Alleged Infringement of Ancient Lights at Newcastle.—In Chancery Division on Wednesday, Mr. Justice Stirling had before him a motion for an interlocutory injunction on behalf of the Co-operative Society of Newcastle-upon-Tyne against the Masonic Hall Company, Newcastle-upon-Tyne, to restrain the defendants from proceeding with the building of a Masonic Hall in High Bridge-street so as to obstruct the ancient lights of plaintiff's premises. Mr. Graham Hastings, Q.C., who appeared for the plaintiffs, said that the street in question was 18ft. wide, and his clients had a large building upon one side of the street, in which they carried on a printing business. The premises had a large frontage, and their chief business was carried on in that portion of the building fronting the street. Opposite the plaintiffs' premises was a building 33ft. 6in. high, and the defendants were proposing to build a new Masonic Hall from Pilgrim-street to the Reindeer Inn, and to carry it to the height of 66ft. 6in. Counsel then proceeded to read a number of affidavits in support of the contention that the proposed building would obstruct the plaintiffs' ancient lights. Mr. Buckley, Q.C., on behalf of the defendants, opposed the motion on the ground that there would be no material interference with plaintiffs' business; that the plaintiffs' premises were for sale, as they intended to remove to another place of business; and, further, that should they remain the actual business would be materially benefited, rather than injured, by the proposed new building. Affidavits were read in support of the learned counsel's contention, and his Lordship, in giving judgment, said that in his opinion there had been a clear case made out for an interlocutory injunction, which he accordingly granted. Injunction accordingly.

In re H. G. Heywood.—Harvey George Heywood applied last week for an order of discharge. The debtor formerly carried on business as a builder in Bridge-road, Hammersmith, and he attributed his failure to loss in connection with building speculations, inability to realise his various mortgaged properties, and to other causes. The liabilities were returned at £7,764, and the assets had realised £194. The Official Receiver opposed the application, and the order of discharge was suspended for two years.

Chancel Screen at St. Peter's, Eaton-square.—At the London Consistory Court on Wednesday, a petition was presented by the vicar and churchwardens of St. Peter's, Eaton-square, for a faculty to remove the present pulpit, to erect a wrought-iron screen, to which shall be attached a wrought-iron pulpit, and to make such alterations and additions in the south transept and south-east chapel as will enable them to use them as a side chapel. The vicar said the estimated cost of the alterations was £2,100, which had been already promised. Mr. John S. Paul, assistant to Sir Arthur Blomfield, who had prepared the designs, described the proposed screen as being in height 16ft. to the top of the cornices, and the gates 3ft. 6in., the width of the central opening being 6ft., and the side panels 2ft. 9in., the chancel arch 40ft. high from floor. A memorial was presented objecting to the screen. The Chancellor, in delivering judgment, said he was satisfied that it was desirable there should be a chancel screen, with gates. The only objection was its great height; but if the parishioners withdrew their opposition he would allow the faculty to go. The case would be adjourned for that purpose. The faculty for the side chapel would be granted.

CHIPS.

The Duke of Norfolk publicly opened on Wednesday a new road and bridge which he has had constructed near Arundel Castle, and which he has presented to the borough.

The Duke and Duchess of Rutland opened on Wednesday a convalescent home for Leicestershire in Charnwood Forest. The home has been erected at a cost of £6,000, and will accommodate 40 patients.

The galleries, rooms, staircases, and balustrades in the spire of Ulm Cathedral, the highest stone structure in Europe, have just been completed. The spire rises 16ft. higher than those of Cologne Cathedral, and was finished structurally three years ago; access is possible to an open balcony incircling the spire 450ft. from the ground.

The first commission of the peace for Eccles, made known on Wednesday, includes the name of Mr. Frederick Smith, architect, of that borough.

The Tyne Theatre, at Newcastle, was reopened on Monday night, after extensive alterations and improvements, carried out by Mr. G. H. Moor, of West Blandford-street, Newcastle.

The Westminster Schools, Hoole, near Chester, are being warmed and ventilated throughout by means of Shorland's patent Manchester stoves and patent Manchester grates, the same being supplied by Messrs. E. H. Shorland and Brother, of Manchester.

The London County Council's Bill for providing a southern approach to the Tower now only awaits the Royal assent, having passed through all stages in both Houses of Parliament.

The city council of Liverpool have voted an increase of £75 a year to the city surveyor's salary, for the performance of all duties in connection with the inspection of theatres and other places of entertainment.

On Sunday services will be held for the last time prior to rebuilding in Kea Church, Cornwall. The contract for the nave and chancel of the new church has been signed by Mr. Carkeek, of Redruth, the first contract being for £2,750. It is hoped, however, that funds will come on sufficiently well during the next three months to go on at once with the tower and spire and vestries. The total cost is estimated at £4,500. Mr. G. H. Fellowes Prynne, F.R.I.B.A., of Plymouth and London, is the architect.

A supplement to the Egyptian *Journal Officiel* contains a statement of the conditions under which architects are invited to compete for the prizes—amounting in all to £E1,000—offered for the best and four next best designs for the new Museum of Antiquities at Cairo. This programme can be seen at the Commercial Department of the Foreign Office, London, between the hours of 11 a.m. and 6 p.m.

The theatre at Hanley was reopened on Monday, having been remodelled and enlarged so as to afford 800 additional seats, and also redecorated. The architect is Mr. Frank Matcham, of London, and the building contractor has been Mr. C. Cornes, of Hanley. Messrs. De Jong, of London, have done the plaster ornamentation, Messrs. Binns and Co., Halifax, executed the decorations, which are in the French style, and are on an elaborate scale, and the upholstering was by Messrs. Brookfield and Windows, of Stafford.

WATER SUPPLY AND SANITARY MATTERS.

Manchester Main Drainage.—The works for the main drainage of Manchester were exhaustively described by Mr. William T. Olive, resident engineer under the corporation of that city, in a paper read before the Institution of Mechanical Engineers last week, at the annual meeting at Owens College, presided over by Professor A. B. W. Kennedy. Mr. Olive said the question of floods claimed the serious attention of the corporation when in 1872 the River Medlock rose to a height of 25ft. above the ordinary water line, and caused an enormous amount of damage. Reports on the flood question were received; but Salford Corporation were the first to take active steps by appointing a Conservancy Board for the whole watershed of the Irwell. To Salford belonged the credit of first launching out into extensive works of main drainage. In 1887 Manchester was recommended to adopt the system in operation at Leeds, and the necessity for action was considerably hastened by the contemplated construction of the Ship Canal. Operations were begun in 1890, and since that time work had been continuously in progress, and had comprised 22 contracts for main intercepting sewers, tanks, buildings, machinery, and filtering beds. The plan now being proceeded with is an intercepting scheme, whereby, as far as practicable, the new main sewers are carried along the valleys at such depths as to intercept the existing sewers, and convey all the sewage to one main outfall, which forwards it to the sewage works at Davyhulme, five miles distant from the city. A gravitation system has been aimed at and attained, although in some places at the expense of very flat gradients. Nevertheless, it is believed that the sewers will be perfectly self-cleansing. The calculations for the sizes of the sewers have been based upon a present daily water supply of 20 gallons per head, together with five gallons as a margin for increase and for subsoil water—in all 25 gallons per head for a prospective population of 625,000. The main intercepting sewers vary in size from 3ft. wide by 2ft. high to 14ft. by 10½ft. All the sewers up to 5ft. diameter have been built in two rings of brickwork; from 5ft. to 10ft. diameter in three rings; and the main outfall, which is 14ft. wide by 10½ft. high, in four rings. In the smaller sewers blue bricks have been used for the inner ring, and common reds for the outer or back ring. Both hydraulic lime and cement mortar have been used, according to the nature of the ground. By far the larger portion of the work has been done in tunnel. The greatest difficulties to contend with have been presented by the old sewers, which to a large extent follow the same lines as the new, sometimes running about the same level, side by side, or crossing over, under, or through. At Erskine-street, Stretford-road, there is a large junction chamber or bell-mouth, where the combined flow of a 7ft. and a 9ft. sewer discharges into the main outfall sewer of elliptical section, 14ft. by 10½ft. The length of this sewer to the storm overflow chamber is about 3,535 yards, and it varies in depth from 37ft. to 45ft. below the surface of the ground. The storm overflow chamber measures 51½ft. long by 26ft. 2in. wide. In passing under the Bridgewater Canal the main outfall sewer had to be constructed in two cast-iron cylinders, each 8ft. 9in. diameter. From the storm overflow chamber to the tanks, a distance of 4,259 yards, the main outfall sewer is diminished in size to 10ft. diameter, with a fall of 1 in 2,000. It averages 15ft. deep, and has been laid in open cutting and through fields. At the outfall works there are eleven settling tanks, all open to the air, each 300ft. long and 100ft. wide, having an average depth of 6ft., a total water surface area of about 7½ acres, and a holding capacity of 12⅓ million gallons. The floors are of cement concrete, and all the walls of brickwork. The floors of the tanks are level transversely, and fall 1 in 150 from the overflow end to the inlet end. After the sewage leaves the 10ft. outfall sewer it flows through an inclined screen. Immediately behind the screen the chemicals—sulphate of alumina and milk of lime—are added, and mixed with the sewage by an agitator. The land owned by the corporation for filtration, apart from that occupied by the tanks and buildings, is about 325 acres—namely, 112 acres at Davyhulme and 213 acres at Flixton, two miles distant. Only thirty acres are at present laid out, in two beds. The beds are drained by 18in. mains, socketed pipes with puddle joints, laid about 200ft. apart and parallel to the centre bank; into these pipes 6in. agricultural drain-tiles laid 30ft. apart are connected.

Yeadon Water Supply.—The reservoir at Reva, on Hawksworth Moor, just constructed for the Yeadon Waterworks Company, was formally inaugurated last week. Mr. A. E. Preston, the engineer, in giving a description of the work, said the reservoir had been formed by an earthen embankment about half a mile long, 50ft. high at its highest point, and 250ft. wide at the base, with a watertight puddle wall in the middle carried 40ft. below the original surface of the land. The area when the reservoir was full would be 16¾ acres; the height was 765½ft. above sea-level, and the holding capacity 95,000,000 gallons. The streams flowing into the reservoir were fed by an area of about 760 acres of moorland, in the Millstone grit formation. Filter beds have been constructed below the reservoir, and from these the water was carried through Guiseley to Yeadon by means of 10in. iron pipes, which had been laid by Mr. Henry Wilson, of Great Horton; while the other works had been constructed by Mr. John Brigg, of Bingley. The cost of the reservoir had been about £23,000, and the total cost of the new works, including Act of Parliament, land, &c., would be about £30,000.

STAINED GLASS.

Boston Church.—One of the large four-light windows on the south side of the nave of this fine old church has just been filled with stained glass. Figures of the founders of the Christian Church, SS. Peter and Paul, the last of the Prophets, and the first of the Martyrs occupy positions in the chief openings, together with illustrations of their ministry and work. The window has been designed and executed by Messrs. Powell Brothers, of Park-square, Leeds.

CHIPS.

The value has been sworn at £48,498 of the personal estate of Mr. William Calder Marshall, of 115, Ebury-street, R.A., the well-known sculptor, who died on June 16 last, aged 81 years.

A subscription portrait of Mr. John Corbett, formerly member for Mid-Worcestershire, was unveiled on Monday at the Corbett Hospital, Stourbridge, which he founded last year. It was executed by Mr. Henry T. Wells, R.A.

The foundation-stone of the new church of St. John the Baptist at Lock's Heath, Sarisbury, Hants, was laid on Tuesday week. The church will consist of nave, south aisle, and chancel. Mr. Ewan Christian is the architect, and Messrs. Cornish and Gaymer, of North Walsham, Norfolk, are the builders.

The new buildings of the Yorkshire College at Leeds will be opened by the Duke and Duchess of York on Friday, October 5th. The extensions, which include an examination hall and library, have been erected from designs by Messrs. Alfred Waterhouse and Son, and were illustrated by a double-page perspective and a plan in our issue of May 6, 1892.

The first sod of the sewerage works for Heywood will be cut by the mayor of that borough on Monday next. The contract has been taken by Messrs. Townsend, Watson, and Yates, of Sheffield, whose tender of £20,177 was the lowest of fifteen received.

Murillo's "Death of St. Clara" has just been purchased by the Dresden Royal Picture Gallery from Lord Dudley's collection for the sum of £10,000.

Kenyon Baptist Chapel, Solon-road, Brixton, was reopened on Sunday, after renovation carried out by Messrs. Higgs and Hill, of South Lambeth, by whom the chapel was erected (as a memorial to the late Mr. William Higgs, the head of that firm) in 1884.

A new Primitive Methodist chapel has just been opened at Hull; it has been erected at a cost of £4,000.

New Free Methodist Schools are in course of erection in Carpenters' Lane, Foleshill. Messrs. G. and I. Steane, of Coventry, are the architects, and Messrs. G. Kelly and Son, of Foleshill, the builders.

The fifty years' services to the town of St. Helen's, rendered by the present mayor, Alderman A. Sinclair, were publicly recognised on Friday by the presentation of his portrait, painted for the subscribers by the Hon. John Collier, and hung in the council chamber of the town hall.

A memorial Celtic cross has been placed in Hatherleigh churchyard as a memorial to the late Lieut.-Col. Pearse, 1852—94, the winner of the Queen's Prize at Wimbledon in 1875. It is constructed of Gunnislake granite, and stands over 11ft. in height. The work was carried out by Mr. Petherick, of Hatherleigh, from designs by Messrs. S. and J. Hooper, of the same place.

The Cannock school board at their last meeting adopted plans prepared by Messrs. Bailey and M'Connal, of Walsall, for the enlargement of the Five Ways Schools, and instructed the same firm to prepare plans for the enlargement of the schools at Rawnsley.

A new parish church at Balranald, North Uist, was opened for public worship last week. The building is seated for about 400, and is a substantial stone one, having a belfry, in which is mounted a bell of 5cwt. It is furnished in varnished pitch-pine, and is inclosed with a stone wall.

Our Office Table.

The Council of University College, Liverpool, made an important appointment on Friday, when, on the unanimous recommendation of the senate, Mr. Fred M. Simpson, of Westminster, was elected to the professorship of architecture. Mr. Simpson was articled to Messrs. Bodley and Garner, gained the Royal Academy Travelling Studentship in 1884, and during 1891-2 was editor of the *Architectural Association Notes*. His executed work has been chiefly in the domain of Domestic architecture. Mr. Simpson will at once take his place on the board of the School of Architecture and Applied Arts, and proceed to active organisation of classes and appointment of teachers in readiness for the coming session.

Sir James D. Linton and Mr. James Orrock have returned to the attack on the management of the National Gallery, and again complain that in consequence of the dry, and as they contend, excessive heat maintained in the rooms, the destruction of numbers of our great painter's works in which asphaltum was used as a medium, are rapidly cracking and going to pieces. They state that at a recent visit to the Gallery they noticed that fresh cracks were visible in many of the British pictures, including Wilkie's "Blind Fiddler," No. 99, "The Village Festival," No. 122, and "Knox reading the Bible," No. 894; Stothard's "A Greek Vintage," No. 317, Stanfield's "Entrance to the Zuyder Zee," No. 404, Turner's "Orvieto," No. 511, the "Apollo and Daphne," No. 520, and "Italy—Childe Harold's Pilgrimage," No. 516; and Constable's "Valley Farm." They suggest, as a remedy, that water in grated troughs should be employed to temper and moisten the heated air, while refrigerators might be introduced in the summer months to secure an equable temperature. Messrs. Linton and Orrock write as usual strongly; but the matter demands the attention of the director and trustees of the collection.

By the way, some of the frescoes in the Houses of Parliament are said to be in a lamentable state. Dyce's fresco in the Queen's Robing Room, to which Sir Julian Goldsmid lately called attention, being perhaps the most conspicuous example. The First Commissioner of Works, Mr. Herbert Gladstone, has appointed a small committee of experts to examine the frescoes, to report upon their condition, and to suggest means of averting their total disappearance.

Several pictures have been acquired for South Kensington Museum during the past year, according to the report of Mr. Armstrong, Director of Art. Among those acquired by purchase are two water-colour paintings by J. F. Lewis, R.A., both Oriental subjects. Mr. Jas. Orrock, R.I., has given a valuable oil picture, a rocky landscape, by Henry Dawson, whose work was unrepresented; the Department have also received a collection of 66 water-colour paintings from Mr. I. E. Taylor, including examples of the work of Glover, Havell, the two Sandbys, Eldridge, Cozens, Girtin, and other eminent artists at the end of the last and beginning of the present century. Miss Elizabeth Anderson has bequeathed oil and water-colour paintings, principally by Clarkson Stanfield, R.A.

Amongst the latest acquisitions made by the authorities of the Louvre is a statuette sculptured in wood, which has been purchased for 10,000f. According to M. Maspero, the renowned Egyptologist, the work of art in question dates back to the eighteenth dynasty of the Pharaohs. It represents a lady of that period lightly draped in a robe of transparent gauze, and in the opinion of the expert the beauty of the carving and the delicacy of the proportions render the statuette the most remarkable piece of sculpture which has been discovered in Egypt during the present century.

The ceremony of opening a new convalescent home at Pegwell Bay, near Ramsgate, presented by Mr. J. Passmore Edwards to the Working Men's Club and Institute Union, took place on Monday. There was a large attendance, including Mrs. Edwards and the Mayor of Ramsgate, who made appropriate speeches. Mr. Hodgson Pratt, president of the union, in proposing a vote of thanks to the donor, alluded to the gratitude which the 80,000 members of the 400 or 500 clubs affiliated to the union felt towards that gentleman, whose gift was the more appreciated on account of the unostentatious manner in which it was given. Mr. Passmore Edwards, who was received with enthusiasm, formally declared the home open. The building, which was formerly the Clifton Hotel, contains some thirty rooms, which include accommodation for patients needing isolation. Mr. Maurice B. Adams, F.R.I.B.A., supervised the alterations, which have been carried out by Messrs. Jarman and Sons, of Ramsgate.

Red tape has not yet been abolished in the architect's office at the Education Department, if a letter from "A Vicar" which appeared in Monday's *Standard* is genuine. The writer asserts that a small alteration having been required to his school by the Department, he sent a plan of the proposed works drawn to ½in. scale, in compliance with orders, for approval. After a considerable delay a letter was received, returning the plan and estimate, and curtly stating "that the plans should be drawn to ⅛in. scale (Requirements ii. and iii. of Schedule VII. of the Code), and Rules 13 (b) and 6 should be observed." The consequence is that the work, which was to have been done during the holidays, cannot be completed before the school reopens, and great inconvenience will be caused.

The Building Trades Exchange, which it was recently resolved to establish for Glasgow and district, was opened on Wednesday at 30, Gordon-street, Glasgow, with Sir William Arrol as president, and Mr. W. M. Cunningham as secretary. The premises include a general room, a private room for members, two sample rooms, and an apartment to be used as an office by the secretary and for the meetings of the directors. Private drawers are provided for members, and there is a safe-room for the deposit of plans and valuable documents. Already there are about 120 subscribers, consisting of architects, measurers, builders, and others connected with the building trades in the west of Scotland.

The battle of the sites for the public buildings at Hull has at length been settled. The town council propose to erect in one block a public hall, technical school, and central free library, and no fewer than five sites have been suggested. Three of these embraced property in the neighbourhood of Waterworks-street, Carlisle-street, Prospect-street, and Waltham-street, and the estimated cost ranged from £210,000 to £280,000. Adoption of any one of these sites would have necessitated very extensive improvement, which would open out important thoroughfares. Alternate sites, which did not propose any street improvements, were submitted, situated in Albion-street and Prospect-street respectively, the former being estimated to cost £60,000 and the latter £57,000. The town council have by 24 votes to 18 finally adopted the Albion-street site.

Trade News.

WAGES MOVEMENTS.

Bolton.—Two hundred masons struck, on Friday, as a protest against the importation of sawn stone.

Perth.—The strike among the slaters of this city was brought to an end on Monday, when the masters agreed to pay the additional halfpenny on the wages, thus making the rate 8d.

Halifax.—The joiners' strike, after lasting a little over a month, has been settled. The men accept the masters' offer of an advance of a farthing per hour, with an alteration of one of the rules, so that six months' notice of future alterations to rules or wages shall expire at the end of either June or December.

FAMBRINI & DANIELS,
Manufacturers of IMPERISHABLE CONCRETE MASONRY for
CORNICES, STRING-COURSES, MODELLED PANELS,
And Every Stone-Work Requisite.
LANDINGS and Plain or Moulded and Mitred STEPS, durable throughout.
NO SPECIAL FACE REQUIRED.
WORKS AND OFFICES: LINCOLN.

HAM HILL STONE.
The attention of Architects is specially invited to the Durability and beautiful Colour of this material.
Quarries Well Opened; Quick Despatch Guaranteed; Stonework Delivered and Fixed Complete. Samples and Estimates Free.
Address:—
THE HAM HILL STONE COMPANY,
NORTON, STOKE-UNDER-HAM, SOMERSET.
London Agent:—
Mr. E. A. WILLIAMS, 16, Craven-street, Strand, W.C.

DOULTING STONE.
CHARLES TRASK & SONS.
DOULTING, SHEPTON MALLET.
London Agent:
E. A. WILLIAMS, 16, Craven Street, Strand, W.C.

BILLS OF QUANTITIES & PLANS.

T. PETTITT and CO. Lithograph Bills of Quantities with the greatest expedition. Accurately copied from the draft in clear hand. Orders from the country returned by evening mail on the same day. Terms on application. Also Plans of Building Estates and General Plan Work at very reduced prices.—T. PETTITT and CO., Lithographers, 28, Frith-street, Soho, London, W. Established 50 years.

WM. OLIVER & SONS,
MAHOGANY, WAINSCOT, WALNUT, TEAK, VENEER, and FANCYWOOD MERCHANTS,
120, BUNHILL ROW, LONDON, E.C.

The most extensive Stock of every kind of Wood in Planks and Boards, dry and fit for immediate use.

TENDERS.

*** Correspondents would in all cases oblige by giving the addresses of the parties tendering—at any rate, of the accepted tender; it adds to the value of the information.

Abertillery.—For the erection of four cottages at Oak-street, Abertillery, for Mrs. H. Lewis. Mr. D. J. Michael, Old Post-office Buildings, Abertillery, architect:—

Bagley, N., Abertillery (accepted) ..	£805 0 0
Syrett, J. F., and Co., Abertillery...	800 0 0
Barnett, F.	758 15 0

Abertillery.—For the erection of two cottages in Aberbeeg-road, for Mr. W. Bobbett. Mr. D. J. Michael, Old Post-office Buildings, Abertillery, architect:—

Bagby, N.	£354 0 0
Warr, T.	340 0 0
Barnett, F.	336 0 0
Fairclough, J. (accepted)	330 0 0

All of Abertillery.

Bath.—For the erection of a park-keeper's lodge in the Crescent Fields, for the city council:—

Chancellor, E. (accepted)	£406 0 0

Bath.—For a ladies' cloak-room in the park, for the city council:—

Wibbey (accepted)	£74 0 0

Bedminster.—For building new schools at Merrywood, Bedminster, for the Bristol school board:—

Bevan, A. J., Bristol (accepted).

[In lieu of tender from Humphreys, withdrawn after acceptance on account of error of £1,000.]

Birkenhead.—For repairs to the sewer wall:—

Tomkinson, W., and Son, Dansie-street, Liverpool (accepted) ...	£726 0 0

Boston, Lincolnshire.—For alterations to the workhouse. Mr. S. Sherwin, architect:—

Greenfield, W.	£340 0 0
Leafe, J....	331 0 0
Lucas, J. (accepted)	329 0 0

[Architect's estimate, £350.]

Bradford.—For carpet-beating works in Drummond-road, Bradford. Rycroft and Firth, Bradford, architects:—

Accepted tenders.
Masons:—Brown and Craven.
Joiners:—Wilkinson K., and Sons.
Plumber:—Fisher, A.
Plasterers:—Sugden, B., and Sons.
Slaters:—Hill, A., and Son.
Painter:—Arundel, J.
All of Bradford.

Bromley, Kent.—For the construction of a new road, with sewer and surface water-drain, for Mr. Lloyd. Messrs. Hugh S. Cregeen and Son, surveyors:—

Heskett, A., Bromley	£436 10 0
Lansbury, F. and W., Bromley ...	360 0 0
Woodham, J., Lewisham	359 0 0
Peill, E., and Sons, Bromley* ...	319 10 0

* Accepted.

Burley, Hants.—For constructing a brick roadside bridge at Burley, for the Ringwood highway board:—

Barrow, H. (accepted)	£54 0 0

Canterbury.—For an iron fence and gates at Castle-street churchyard, for the city council:—

Drury and Biggleston (accepted) ...	£62 10 0

Cregina.—For the new bridge at Cregina, for the Radnorshire county council:—

For masonry work:—

Davies and Son, Newtown (accepted)	£138 0 0

For iron and steel work:—

Horshay Co. (accepted)	£205 0 0

Durham.—For proposed additions, &c., to Whitworth Hall, for Mrs. R. Duncombe Shafto. Mr. H. Henry, Durham, architect:—

Kell, J., Durham (accepted) ...	£1,148 10 0

Deptford.—For providing and fixing a complete system of low-pressure hot-water apparatus, for warming the whole of the Hughes-field School, now being enlarged, for the London School Board:—

Fraser and Fraser	£536 0 0
Kinnell, C. P., and Co.	530 0 0
Berry, Z. D., and Sons	518 0 0
Wharton, W. H.	490 0 0
Cannon, W. G.	488 0 0
Maguire and Son	467 8 0
Wenham and Waters, Ltd.	450 0 0
Ellis, J. C. and J. S., Sheffield* ...	419 10 0

* Accepted.

Devonshire.—For the construction of the Exeter, Teign Valley, and Chagford Railway:—

Dickson Brothers, of London (accepted).

Failsworth.—For the construction of sewage purification works, for the local board:—

Freeman, Geo., Hollinwood (accepted) ...	£5,728 12 8

Finsbury.—For inclosing one end of the entrance lobby with glazed framing at York-road Board School:—

McCormick and Sons, Canonbury-road*	£48 10 0

* Accepted.

Grimsby.—For the erection of public conveniences in Ribay-square, for the town council:—

Siminson, T.	£653 0 0
Marrows, H.	650 15 0

[Neither tender accepted, the borough surveyor to carry out the work at an estimated cost of £500.]

Hackney.—For providing two new w.c.'s at Homerton-row Board School:—

Davenport, W. J., Clapton (accepted)	£131 0 0

Haywood, Lancs.—For the construction of sewerage works, for the town council:—

Townsend, Watson, and Yates, Sheffield (accepted)	£20,117 15 3

[Lowest tender of fifteen received; highest nearly £36,000.]

Hendon, Middlesex.—For new billiard-room, &c., for Mr. R. Bousfield, Q.C., M.P. Mr. George Hornblower, A.R.I.B.A., 20, Fitzroy-street, W., architect:—

Tout, W. (accepted)	£650 0 0

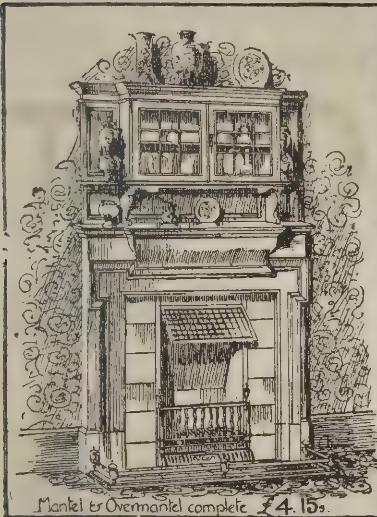
Kentish Town.—For building new story to Messrs. Carr's ink factory, Kentish Town. Mr. L. Sargant, architect:—

Davenall, H. G., Southampton Works, Gospel Oak (accepted) ...	£400 0 0

Kineton.—For the erection of a public hall. Mr. T. T. Allen, of Stratford-on-Avon, architect. Quantities by Mr. H. Hugh Allen, Edmund-street, Birmingham:—

Harris, J., Stratford-on-Avon (accepted)	£648 0 0

[Thirteen tenders varied from £820.]



Mantel & Overmantel complete £4.15s.

THE BUILDING NEWS
AND ENGINEERING JOURNAL.
VOL. LXVII.—No. 2067.
FRIDAY, AUGUST 17, 1894.

CRACKS AND SETTLEMENTS.

FEW buildings of any magnitude are quite free from cracks and settlements. It is often a matter of the utmost importance to ascertain their cause. The architect naturally desires to do so in every case, that he may guard against them for the future. The owner has an interest in finding it out, that he may prevent the injury from going further. The builder naturally wishes to clear himself, if he has been unjustly blamed for the defects that have appeared in his building; and the outsider, if by chance the evil seems chargeable to outside interference, is equally anxious to show that it is not of his making. Amongst all these conflicting interests the facts are often in danger of being misinterpreted, for there are very few failures of this class which do not at first sight seem capable of more than one explanation. A great number of small details may have to be ascertained, and balanced one against the other, before one theory is conclusively proved to be true and another to be false; so that the first need in these inquiries is to avoid jumping to a conclusion, and to keep a fair and open mind.

We will begin with cracks traceable to the foundations. Firm, undisturbed earth will safely bear from one to two tons per superficial foot. Clay, if covered up from rain and sunshine, will carry from three to four, or even five, tons per foot, and hard, compact gravel considerably more. If greater weights are put on these substances respectively, the superstructure will sink, and as the pressure is likely to differ at different points, it will probably sink unequally. The more unequally it sinks, the worse it will crack, and this will happen, too, when a small part of the soil is softer than the bulk of it, and almost as much when a small part is harder. This is why pieces of old footings and concrete which may be met with in digging out the trenches for a new building should be removed and not made use of. Having long been subjected to pressure, the probability is that they would sink or settle less than the concrete or footings of the new work, and cracks in the walls above would appear on each side of them.

The clay that will carry most weight is a stony clay, or a mixture in different proportions of clay and gravel. In some places, for instance in the Essex district to the north of London, there is a good deal of what may rather be called "shaly" clay. It is free from stones, and tends to split into horizontal flakes, or *laminæ*, with a smooth, soapy surface. While this clay is protected from the weather, as it is, for instance, below the inner walls of a building, it will safely carry a great weight, provided always that it cannot escape laterally at a lower level. But once let a trench be dug, even at a distance of many feet, and these soapy, slippery flakes will begin, by degrees, to slide towards it. If the trench is wet, the process goes on faster. The flakes, as they reach the damp part, break into smaller and smaller fragments, and finally melt into mud. Each particle which does so, makes room for another particle behind to take its place, and so, in time, a sinking or sliding of the clay takes place at an angle so slight that any movement in it would at first seem quite impossible. "You have no need to plough your fields here," said a London architect to an inhabitant, after his first experiences with this shaly clay; "you only need to take off the grass and cut shallow trenches a dozen yards apart, and the fields would plough themselves."

It is quite otherwise with the stony clays of London. Their tendency to slip is incomparably less. Even if they had a tendency to lamination, the pebbles they contain would bind the beds together. But, apart from this, they are of a firmer, more coherent nature. It is of these, and such as these, that the textbooks speak when they state that the angle of repose in clay—the steepest slope which it can permanently be made to keep—is one of about 40°. There is plenty of shaly clay which, even while fairly dry, could hardly be trusted to keep half as steep a slope, and which, when wet, would soon spread itself out into a horizontal mass.

Failures in rock foundations, if uncommon, are difficult to guard against. The rock, at the level of the footings, may all be equally sound and equally hard, and yet, at a little distance beneath, fissures and cavities may exist which no one knows of. Our readers may remember, three or four years ago, the unaccountable fall of the central tower at Barmouth new church. The tower was by no means lofty, the span of the tower-arches was only moderate. They had, to all appearance, ample abutment, and the rock on which the building stood was of the hardest description. But an artificial terrace had been cut out in the mountain side to receive the structure, and this terrace was afterwards enlarged by blasting. It seemed probable that either in its formation or its enlargement the rock foundation had been shattered: unless, indeed, the shaking caused by the explosions had acted directly on the recently built work of the tower and its supports, and so caused the calamity.

Settlements may be produced from bad concrete or imperfectly built footings. Some builders seem to think that any sort of bricks, from shuffs to clinkers, are good enough to go underground. Now, it is obviously true that colour here is of no consequence. As far as that goes, the bricks may as well be black, as white or red. But it happens that in a London brick clamp, the dark or vitrified bricks are almost always the bent or twisted ones: and a bent brick will break and settle with a very little pressure on the top of it. Some mysterious settlements may perhaps be explained by remembering this obvious fact. When the concrete in a foundation fails, it is generally through carelessness in mixing or badness in the materials. Concrete properly made with one part of the best Portland cement to two of sand and six of clean beach shingle, will require 30 tons per superficial foot to crush it when three months old; but if imperfectly mixed, or not entirely free from loam or dirt, it will give way with a small fraction of this weight. So it will if the cement is allowed to set and then "knocked up" again with water; but this fault, from the nature of the case, is rarer in concrete than in brickwork.

A common evil is the building of brick arches and brick piers with soft rubbers. The architect is tempted to employ them from the ease with which they can be cut to shape; but in features which bear a heavy load, this softness is really a drawback, and not a recommendation. The builder of the last generation rejoiced in his camber arches of malm stocks, and in thousands of cases these arches have cracked and allowed the superstructure to settle. The modern architect is fond of using orange-red rubbers in similar positions, and time may probably show that he does it with a similar result. At any rate, such bricks should not be trusted to where the load is heavy. The piers should have in addition a solid core, and the arches a sufficient quantity of half-brick rings above or behind those of the weaker material; and this suggests another way in which unsightly cracks arise. A facing of gauged work with fine joints is commonly attached to a backing of ordinary brickwork, which has comparatively thick beds of mortar. After a time the mortar in the backing gets compressed, and in a height of 10 or 20ft. the work sinks perhaps a quarter or half an inch. Now if it stood alone, this would matter little; but the facing is attached to it, and this facing, having thin beds, scarcely sinks at all. Yet the weight behind must pull it down, and as it cannot come down in a plane face, it bulges and cracks. The same thing happens with stone quoins or stone jambs bonded into brick walls. The joints of the stone are not only finer, but fewer than those of the bricks: hence the latter settle down, and the stone has to bear all sorts of irregular strains.

Columns are liable to crack from many causes. We have known all the nave piers of a new church to fall for want of a simple calculation as to what weight was coming on them, and how much they would safely carry. In this case they were of Corsham stone, which cannot be trusted with more than $1\frac{1}{2}$cwt. on the square inch as a permanent load. Had they been of hard York, which will safely bear 6 or 8cwt. on the same area, they might be still remaining. The London contractor thinks nothing equal to Portland stone; but this, as to many of its qualities, is a mere superstition, and it is especially so as to its resistance to crushing. Corsham stone will bear a little more than Box Ground, Caen a little more than Corsham, and Portland a little more than Caen, but none of them have half the strength of the North of England sandstones. Columns, however, more often fail through faults connected with their bedding than through the actual weakness of their material. We once found a foreman of the old school packing up the space between the foundation of a great tower-pier and the pier itself with bits of broken brick, slate, and tile! This pier had 300 tons to carry, and though it did not fail, because the foreman's method of jointing was discovered and amended in time, mysterious settlements appeared in other places, and were found to be the result of similar practices. Hollow beds are a notorious cause of unsightly cracks in piers. The beds of stonework should be perfectly true and square; but if there must be an error, let it lean to virtue's side—or, in other words, let the beds be almost imperceptibly convex. The slightest hollowness throws the weight on the edges of the stone, and the upshot is that these edges, or some of them, flake off. We have a well-known instance in the granite piers in Farringdon-street, which support the Holborn Viaduct.

Cracks due to insufficient abutment for important arches are serious. But it is surprising to see how an arch will sometimes adapt itself to the weight it has to carry, losing, indeed, its original form, and most of its beauty, but fitting itself for, and actually doing, the work laid upon it. The great tower arch at Newark will recur to the mind of everyone who knows it as an illustration of what we mean. It has changed surprisingly from its original Gothic shape, having even become lop-sided from unequal pressure. Yet it has stood safely for centuries, and may stand for centuries more. The old church at Grosmont, skilfully restored by Mr. J. P. Seddon many years ago, showed another case of insufficient abutment. Here the strain from below the central tower, in the course of ages, had pushed the long row of nave piers much out of the upright, and even threatened to overturn the western wall. But the cracks which are traceable round central towers in many of our cathedrals arise rather from unequal sinking of walls than from want of resistance to the tower arches. Norwich, in spite of its lofty spire, is remarkably free from them. Examples, however, are easily found, and in most of them the origin of the evil is the great difference in weight between the central tower and the walls which surround it.

It may seem at first that a cause which affects a great cathedral tower cannot much concern us, who are not likely to have cathedrals to build. But this cause is also one of the commonest of those which produce cracks and settlements in smaller buildings. Wherever a low porch comes out from a high wall, or a low wing from a higher building, there is liable to be a crack at the junction from unequal sinking. We do not mean by this, unequal sinking into the ground on which the building stands. If the area of the concrete is evenly proportioned to the weight on it, a sinking of this sort will not occur. But cracks and settlements may still appear, as they very often do, in such a place. The cause of them, as of some others we have noticed, ultimately lies in the mortar-joints. If a house is 50ft. high, and its projecting porch only 10ft. high, there will be a pressure on the mortar beds of the house wall where it joins the porch of perhaps 2 or 3 tons per foot super.; while on those of the porch wall, which bonds into it, there will be hardly any pressure worth mentioning. The result is that the house-wall sinks down slightly, while the porch wall does not; and so the bricks which bond the one to the other get cracked across. A similar cause brings about, or is liable to bring about, the same result in all sorts of places where any part of a building, with great weight on it, is fixed to another which carries little weight. A good plan is to build the heavy part first, and let it get its sinking done, before the light part is attached to it; and another way is to connect the two, not by bonding bricks, but by a chase, so as to allow of some vertical movement. Bonding can then be effected by wrought-iron ties, which will bend and not break.

Settlements of walling from shrinkage of timbers or decay of timbers belong, as a rule, to second-rate or third-rate work. Brickwork should not rest on plates built into the wall; and lintels should have discharging arches over them. We have said nothing of the mode of building which brought down the tower of Chichester Cathedral, and threatened that of Peterborough, because the making up of vast columns out of a shell of ashlar and a core of worthless rubble is not practised in the present century, even by our friend the jerry builder.

BUILDING OFFENCES, AND THEIR PENALTIES.

PENALTIES for continuing an offence under an enactment of the Metropolitan Management Act are sometimes imposed against builders and owners who endeavour to evade the Act by pleading that the complaint has not been made within the time mentioned in the Act. The builder often takes no notice of the official intimation, and so allows the time to pass by till it is too late to be enforced. It is necessary that builders and owners should understand their liability to penalty which has been made clear by the decision in the Queen's Bench Division in the appeal case of the "London County Council *v.* Worley." The appeal was against a decision of a Metropolitan police magistrate, who refused to impose penalties under a section of the Metropolitan Management Act for continuing a building at a height exceeding the width of the street after notice to reduce it. The building in question was a corner building to Kensington-court and the High-street. The magistrate in this case refused to convict on the ground that the proceeding was out of time with Section 107, which says: "No person shall be liable for the payment of any penalty unless the complaint has been made before the magistrate within six months after the commission or discovery of the offence." The offence, it seems, originated on the 8th of February, 1893, when the building was completed contrary to the Section 85, which expressly states that "no building, except a church or chapel, shall be erected on the side of any new street of a less width than 50ft., which shall exceed in height the distance from the front of such buildings to the opposite side of such street without the consent, in writing, of the London County Council, &c." A penalty of £5, and in case of a continuing offence, a further penalty of 40s. for every day, is exacted against any person committing the offence. The builder received notice from the Council of the offence in April, 1892; in July, 1892, the building was roofed-in, the wall being of the prohibited height. Again in October, the builder received a penal notice, and in Nov. 1892, a summons for penalty for the erection. The magistrate who heard the case doubted whether the building was erected on the side of a new street, the front being in an old street and the side in the new street. The Court overruled the magistrate, and a conviction for the penalty for the original offence, the erection of the building, was made. The building having been completed in Feb., 1893, the builders withdrew, and the Council proceeded against the owner on a penal notice to recover the penalty of 40s. a day for continuing the building, from the date of notice. These are the main facts of the case as reported. When the case was heard on appeal, the Court decided that the magistrate was wrong, and that the penalties were recoverable. Mr. Justice Mathew said he had tried to discover a doubt in favour of the owner, but was unable to do so. The offence was the continuance of the building after the notice. The contention was that the offence could only be continued by the party proceeded against for the original offence—the erection of the building; but he held that was an erroneous view, and the magistrate ought to have imposed the penalties. For the owner it was argued that the proceeding should have been taken against the owner for the original offence within six months.

The owner of a building which has been erected in excess of the statutory height is, according to this decision, liable, although the time has elapsed. In this case the offence was for a continuance of the building after the notice—a point that was made clear by the judge. The grounds of the magistrate's rulings look, however, reasonable, and may seem to encourage builders in resisting penalties imposed for any trangression of the statute. Section 107 seems to afford a loophole of escape, for it says in effect: No person is liable for any penalty unless the complaint is made within six months after the discovery of the offence. Upon this ground the magistrate refused to impose the penalty. The six months is a sufficient time in which to discover any transgression or violation of the Act; but, from the report, it appears no proceeding was taken against the owner of the building in question within that time. The original offence was the completion of the building above the height allowed without leave of the Council in February, 1893, when the builders retired; but previous to that, in April, 1892, the first notice was given to the builder, who was subsequently summoned, but let off by the magistrate on a technical point, as above stated. Next, the Council proceeded against the owner; but the magistrate again thought the proceeding out of time. These interruptions to the course of the law may well have disheartened anyone, except a central authority like the L.C.C., from going further. The decisions of the magistrate on technical points naturally encouraged the owner and builder to continue the building. We have in this case a good illustration of the working of the present administration of the Building Act—how uncertain the law is, and how often magisterial decisions are at variance with the real intentions of the Metropolitan Building and Management Acts. The decisions of the magistrates are generally based on some technical point or interpretation, instead of upon the larger issues or the real meaning of the Act. If any justification were demanded for a properly-constituted tribunal to try questions of this sort, we have ample proof of it here. Between the magistrates' decisions and the appeal to the higher court considerable delay and costs are entailed upon owners and builders. Not only so, but the frequent reversals of judgment leave a bad impression on the public mind.

TYPICAL ARCHITECTS.

AN American author lately descanted on the several "Types of Architects" with some freedom and humour, but he mixed up those characteristics which were accidental with those which were inherent and personal; and we thus had the "successful architect," the "sensitive architect," and the "engineer-architect" as distinct types, whereas these differences might very well have been all found in the same individual. We prefer rather to note those distinctions which are mutually exclusive or cannot possibly overlap in the same person. These will be found chiefly to depend on individual character and temperament. One able essayist tells us, "A man is a method, a progressive arrangement; a selecting principle gathering his like to him, wherever he goes. He takes only his own out of the multiplicity that sweeps and circles round him." But the architect, in his choice of clients, certainly is not so happily circumstanced, as he sometimes gets a "Tartar" of a client, and he cannot often "gather his like to him." He may get a "screw" one day and a "tyrant" the next, so that, although every man may be a "selecting principle" in some senses, he certainly cannot help himself, or pick and choose among building owners. If the architect could select his own circle of clients all would go well and smoothly; and, contrariwise, if every employer could select his architect after his own heart, it would be much easier and better. Men of like views as to style, of similar taste and habits would be selected on either side, and there would be less of heartburnings and friction, and far fewer disputes to settle by law. No doubt. But there is something in conflict. Opposition is often beneficial, and a blessing in disguise, and many exemplifications of sturdy and vigorous growth have been traceable to the "clash of interests," to one strong, robust, practical mind coming into contact with another mind of sensitive nature and artistic culture. Variation of this kind has generally produced the best results in architecture, as in nature. The practical man and the artist stand at opposite poles, between which there are various degrees. Nor is it too much to see that these several types of the profession have been called into existence in response to the public demands. Business, planning, construction, sanitary science, and art reflect so many distinct requirements of the public. Rarely is it possible to find one individual a master of all of them. Each gathers to himself a certain practice, and it is thus we have five or six distinct species in the profession. Let us glance at each of these in turn.

The "practical" architect looks at matters pertaining to his profession in a common-sense and business-like manner. Never having troubled himself much about art and its manifestations, he takes a perfunctory way of discharging his functions. In his dealings with his clients, the letter of his instructions is carefully studied; he readily acquiesces in the views of the client as to plan, and does not scruple to carry out his notions as to the position of rooms, or, if need be, to copy some other building which embodies his client's wishes in arrangement, while in elevation he is ready to relieve himself of the duty of design by reproducing some other building. He regards his duty to be simply that of giving his client what he asks for, of becoming a mere instrument, instead of advising or putting into artistic order his requirements. This short-sighted view of his calling finds ready acceptance amongst many of his own class, who do not always know what they want. In carrying out the contract, Mr. Trudge looks at everything through the quantities and specification. He prides himself on his economical and inclusive estimates. Any eccentricity on the part of the employer is met by a curt and frank acquiescence. If it is the addition of a bay-window or the extension of a room, Mr. Trudge refers to the bill of quantities to see whether any deduction or cutting-down of expense in another place can be made. He is particular, too, about superintending the works, in making personal inquiries about materials, and in selecting fittings. More trouble is taken by him in observing an easement, in adjusting differences, and in testing girders, than in such matters as the design of any detail or the preparation of a scheme of decoration, or the selection of a wall-paper. The practical man in competitions is more particular about complying with the letter of the conditions than his artistic brother: he regards the exact areas of the rooms scheduled, the accommodation and limit of cost, instead of considering these opportunities as escapades for his imagination and inventive skill. Trudge looks at the problem in a matter-of-fact way, not at the possibilities of design.

Another typical representative of the modern school is the "planner." He is the possessor of a certain cleverness in arranging buildings, and will spend hours over ruled sectional paper and a geometrical problem. When he designs a domestic building, everything else goes by the board except plan. We have known such even take out a patent for a plan of public buildings. He prides himself in being able to get more rooms on a given area than anybody else, in affording easy and direct access to the main apartments, in avoiding unnecessary corridors and passages, in giving ample light, and in being compact in his arrangement; but he does not trouble about elevations or sections. These he generally leaves to a draughtsman in his office. If a better or larger room can be obtained by the use of a girder, he does not scruple to employ one to carry a wall, for he holds that construction is of minor importance and ought to be made to suit the plan and be subservient to it. An architect addicted to plan takes a very one-sided view of his vocation, and has seldom any artistic impulses: he is a thorn to the competition assessor, for the simple reason that his plan may be good, but his elevations are atrocious.

Generally speaking, a planner makes a better design for a hospital, or asylum, or school than other kinds of building, as the architecture of this class of structure is not a material feature. He puts in for buildings such as baths and washhouses, public libraries, and schools, in which he can exhibit his skill, and he can generally tell you offhand how much more accommodation he has got than Mr. So-and so has, or that his baths or schools erected at Trumpington-on-Sea have cost less than any in the district per head. But his elevations never appear to suit his plan: they have been prepared by a draughtsman who has tried to fit decent garments on to a remarkably awkward figure The expert plan-man, like the expert sanitarian, is too much of a "faddist" to take a complete view of the functions of the architect, and is inclined to delegate to others the duties of construction, design, and decoration.

Next we have the "inventor" type, who is almost invariably as great a "bore" on some particular scheme for building walls of concrete, or inventing a roof which shall stand without ties, or a floor of iron and concrete to resist fire. We see him puzzling his brains over some such problem. He will even introduce a dome for the sake of applying his recent invention. Though exceedingly inventive, he is full of hobbies, very apt to tire the patience of his assistants and clients by constructing models, in writing books on his favourite hobby, or lecturing upon the advantages of his system. A problem in construction or an exercise of *tour de force*, is far more attractive to him than a simple plan or elevation, and what Trudge would look on with impatience, and would probably hand over to the contractor, he regards with peculiar interest. It may be such a thing as an improved sash-window or fireproof floor; but whatever it is, it receives more personal attention than the other duties. Although more conscientious than the pushing architect, the inventive individual is somewhat troublesome, especially if he happens to be that particular sort known as the "sanitary inventor," whose main idea of the architect's duty is to introduce a correct system of drainage and ventilation, no doubt very desirable, but which may be so persistently pushed, that the building is regarded more in the light of a showroom for particular specialities in apparatus and traps, than as a residence in which the sanitary necessaries are complete but not obtrusive. These are matters to which especially the adage applies: "The end of art is to conceal art." Would that inventors could be made to think so! The sanitary specialist is too aggressive in his method.

Another large and important representative is the man who places art above everything else, and who affects to despise all the three preceding qualifications of the architect's functions. Mr. Push-Art is chiefly an "artist" in that particular school which raises it to a separate entity, and who does not care to look at it in its commonplace sense and everyday application. His plans and elevations are usually full of whims—irregular rooms, ingle-nooks, oriels and bays, and all kinds of eccentricities. He pays more attention to the latest idea in the shape of a chimney-piece or door-knocker than to good planning or construction. In competition work all his strength is centred upon his elevations and perspective sketches. Mr. Push-Art has great aversion to the humdrum of building routine, and readily delegates all the practical details to the contractor or clerk of works. If a "Queen Anneist," he produces an extraordinary mixture of features that shock the mediocre taste, and he is nothing if not erratic or distinctly *outré*.

It is needless to say the "art" man is supercilious, does not pretend to be a business man, or a strong plan-man or constructor, and is very awkward in his dealings with contractors and tradesmen. Looking upon art as the be-all and end-all of architecture, he justly esteems his services, and thinks they ought to be paid for at a higher rate than his client is disposed to give. Mr. Push-Art is particularly sensitive—too fragile for the business relations and rebuffs of business, and too refined to mix with builders and workmen. Everything he has to say has to go through the contractor or clerk of works. He is seldom seen on the scaffold, and therefore it is his sketches are hard to carry out to give him satisfaction. It is extremely difficult to carry out a stone or wood detail that will satisfy him. Another weakness of his nature is that he cannot conduct business, his temperament not being suitable. He may have right ideas of the community of art, of co-operative principles of industry; but somehow he has not the organising qualifications necessary to carry them into effect.

Lastly, we may refer to a well-known type of practitioner whose qualifications are self-complacency and a desire to push himself to the front. We have many such in all professions. He is first in advertising his pretensions, in obtaining a commission by some trick or artifice before his more competent brother. Mr. Bluster does not mind a little subterfuge, or in stealing a march on a brother professional whenever an opening occurs. No opportunity is missed by him in sounding his own praises wherever he can. He goes to any trouble in presenting his card to an intending builder, or in canvassing a committee. Of course, Mr. Bluster is a member of the Institute, or of some society, and has a string of initials after his name, reads papers, and so on. He takes care to advertise himself in every newspaper—by publishing paragraphs, by giving lists of fictitious tenders, by writing letters to professional and other papers, and losing no opportunity in pressing his claims forward. Whenever he gets a job he takes care to place his name conspicuously on the board as architect. Being sociable, he easily obtains invitation to his client's table to festive dinners and meetings, where he hob-nobs with Mr. Squire So-and-So, leading politicians, councillors, or tradesmen. Being talkative, he readily obtains a passport to society when he expatiates on his success and his talents. Mr. Bluster has ability of a sort in being able to make people believe without proof. He generally knows where to go for his designs and his contracts, and his business qualifications are a trifle above many of his compeers. Above all, he knows what people to get at, has a keen insight into human weaknesses, and by a little tact is able to get at the "right side" of his clients. These are a few of the main types of the profession which appear to preserve their individuality. They represent fairly the different classes of men which the modern professional system has created. A combination of these types in one individual is seldom seen, but their distinctive merits point to qualifications which the public appear to patronise.

THE ARCHITECTURAL ASSOCIATION EXCURSION, 1894.—II.

[WITH LITHOGRAPHIC ILLUSTRATIONS.]

LAST Friday we illustrated several of the more important buildings to be seen in this rich district, which has been so well chosen for the Architectural Association Excursion this week. To-day we continue our series of drawings, which will be completed in our next number. We will now finish our notes on the places seen by the excursionists in the order in which they were visited. Croscombe Church, the first item down on the programme for last Monday, was referred to when we printed the interior sketch showing the screen with our first article. It stands amidst a group of stone mullioned cottages on the slope of the hill, overlooking the "Valley of the Cross," with the village inn, of 15th-century date, adding quaintness to the charming picture, in which the mutilated stone cross in the high road marks the skyline of the landscape. The broad flight of steps to the churchyard enhances the elevation of the tower's base, and the stone-built Perpendicular spire, by contrast with the more usual Somersetshire towers, is considerably increased in interest. The belfry stage is cleverly managed, and the panelling about half-way up gives interest, a good feature being also made of the parapet below, where a canopied figure marks each of the four faces of the tower. The cornice has some very spiritedly-carved gargoyles, and admirable buttresses unusually treated are introduced in a suggestive way, and taking the splay on plan at the angles. A good sketch of this tower and spire, by Mr. T. Maclaren, appeared in the A.A. Sketch-Book, Vol. VIII., New Series. The inside of Croscombe Church is its chief glory, on account of the uncommonly elaborate Cinque Cento screen and pulpit, the roof over the chancel

being, too, of the same character and date. The A.A. Studentship was awarded to Mr. A. E. Bartlett for his set of measured drawings of this work, which we published in the Building News for July 26 and Sept. 27, 1889. The Fortescue arms figure on the screen, and those of Bishop Lake, who governed the See of Bath and Wells from 1616 to 1626, are carved in the pulpit, while all the work is clearly of the same date and detail. The pulpit has, however, the advantage of some colour decoration, enriched with a moderate use of gilding in parts. The late Mr. Sedding had the fabric in hand for some time when he repaired the roofs, which were in a sad state before he was called in, greatly to the risk of the barrel vault with its 15th-century carved bosses over the nave. The curious visitor can but notice the position of the chancel arch, which is located several feet west of the choir screen, where it is supported by corbels. The pewing of the nave has poppyheads throughout, and some very handsome brass candelabra, put up by Hugh Fortescue, a rich mill-owner of the district, in 1707, deserve particular mention. The 15th-century Hall of the old Manor House of the Fortescue family is now used as a Baptist chapel.

The next place seen was Chewton Mendip, away over the hills to the north of Croscombe on the main road to Bristol, among the spurs and combes of the Mendips. The ornate Late Perpendicular tower of the church, following the Taunton type, is one of the richest and largest to be seen throughout the county, and inside the building the monument to Lady Frances Waldegrave and some good, richly carved oak seatings are worthy of note.

We gave a view and plan of this tower, which stands on the top of the hill, in our pages on July 31, 1885, when the Rev. Prebendary Philpott wrote to us a comparative description respecting it and that of St. Mary's at Taunton, which, of course, has been rebuilt. The Chewton tower, which Sedding restored, is certainly much more satisfactory in its proportions, and has the advantage of a plain wall-space on the flanks of the ground stage. The iconography of the western face is interesting, with an heroic statue of the *Salvator Mundi* under a canopy, standing on a corbel over the west window, and having His foot resting on a globe, representing the world. On either side of the figure are images of angels in adoration, holding ribbons with legends, others bearing emblems of the Passion, and the lowermost ones kneeling on the hood mould of the window. The height of the tower to the top of the parapet is 105ft. 6in., and to the top of the pinnacles it measures about 120ft. Between the buttresses at the base it scales 20ft. wide.

Tuesday, as we have before mentioned, was spent in Wells, and on Wednesday the proceedings began at Mells by visiting the Manor House and Church, of which we gave a lithographic sketch last week. Leaving Nunney Castle (see lithographic view herewith) south of Frome to the eastwards, the excursionists made the return journey to Wells through Shepton Mallet, where a halt was made after a considerable drive of about an hour and a half, passing little of architectural interest on the way. At "Shepun," as the locals call the village, the Market-place, with its incongruously quaint 16th-century hexagonal cross and shelter surrounded by the tile pented stalls about the square overlooking the church tower, forms a composition of that natural and unsophisticated character such as the water-colourist may often search for in vain. The accompanying outline sketch will serve to give a notion of the picture. The height of the cross shaft is said to be 51ft., and its builders are recorded to have been Walter and Agnes Buckland, who put it up about the year 1500. The tower of the church, like many another in these parts, is a good one; built after the fashion of those at Yatton and St. Mary Redcliffe, at Bristol, it is crowned with a squat, incomplete spire, covered with lead. A view of this tower is furnished in Wicks's folio, "Towers and Spires." The nave roof is a magnificent one, elaborated with 350 panels of diverse patternings, and built in oak, and left free from the horrid varnish which disfigures so much of the carved work in neighbouring churches. This roof is one of the finest to be seen in the entire district. The building was for some time in the hands of Sedding, who repaired it generally. Doulting, with its double transeptal Barn belonging to the Abbots of Glastonbury, is close to Shepton Mallet, and the sketch reproduced herewith gives an idea of its uncommon plan and good proportions.

Yesterday (Thursday) was devoted to the seat of the Hoares at Stourhead and to Longleat House, of which latter mansion we print a drawing, taken by permission from Mr. T. Harris's recently issued book, entitled "Three Periods of English Architecture." A view of the former building figured among our illustrations last week, when some references to both houses were given. In the beautiful grounds of Stourhead is the High Cross of Bristol, dating from the 14th century. Pilton is the first place to be seen to-day (Friday), and here the Mediæval Barn, also built by the monks of Glastonbury, is the chief attraction. It has beautiful carvings in the gables representing the Evangelists, and its traceried or cusped windows give a further richness to the design, which is also marked by some admirably massive buttresses. The scraping process was so thoroughly applied to Pilton Church, that much of its interest has gone, though the building stands well, and has a chancel very similar to that at Ditcheat. The Barn at Pilton was illustrated in the Building News for July 20th, 1883, and drawings of it will be found in Parker's "Domestic Antiquities," Vol. II. Evercreech Church, the next halting place, is famous among its compeers, and furnishes a familar example of the Wrington or Wells type of Somersetshire towers. We gave a good sketch of it last week, and another drawing of it appeared in our issue for December 28, 1888, when we gave two other towers—viz., those of Huish Episcopi and Banwell. Evercreech Tower is 130ft. high, and resembles very much that of Wrington ("B. N.," July 31, 1885), which stands out as the masterpiece of the third type of the towers of Somerset, the two others being Taunton and Bristol. St. John the Baptist at Glastonbury, second perhaps to St. Cuthbert's at Wells, is also of the Evercreech and Wrington type, which last certainly is the best of the three. We published some time ago some pencilings ("B. N.," Jan. 26, 1883) of the

ARCHITECTURAL ASSOCIATION XN · 1894

comical carvings which add so much interest to the exterior of the church at Evercreech, but there is not much to detain the architectural visitor inside the building. Mr. John L. Robinson, R.H.A., the hon. photographer of the A.A., has been busy taking several views of all the places visited. The final halt on to-day's excursion is to be made to Bruton, a quaint, straggling old town, chiefly distinguished for the varied and numerous wrought-iron signs, which give so much piquancy to its main street. (For details of these sign stays, we may again refer our readers to our own sketches in the "B. N." for Nov. 24, 1882.) The old "hospital" at Bruton, with its quad and chapel and hall, presents a singularly admirable example of Late Domestic Gothic, dating really from 1617, when its founder, Hugh Sexey, built the institution for ten old persons. The unassuming character of this work should furnish the modern practitioner with a guide, and help to restrain any inordinate endeavour to secure effect with needless ornamentation. The old vicarage is considered also an object of interest. The church at Bruton has a tower of much beauty, and scale is given to its size by the minor tower above the southern porch. The roof over the nave, too, is a grand one, with traceried ribs ranging with the tie-beams. The beautiful clerestory is due to the niches between the windows, and the crypt under the chancel is of Transitional Norman. The building was very much restored by the late Herbert Carpenter, 20 years ago, at a cost of £5,000. A visit to Glastonbury to-morrow (Saturday), with its abbey, splendidly towered church, abbot's kitchen, ancient tavern, and the "tribunal," will close the excursion. Mr. H. D. Searleswood has again acted as hon. sec. to the excursion party.

LOADS ON COLUMNS OF HIGH BUILDINGS.

A LETTER in the *Engineering Record*, signed H. H. Quimby, discusses the question of moving loads in many-storied buildings. The writer refers to the wretched details permitted in the steel skeleton type of structures. He says "Almost every column of a high building carries at every tier floor area that is divided by partitions into from two to four spaces, intermediate columns, generally four, and the chance of getting the full load on even one story is quite slim, and where reduced by multiplication of the stories it may, like the infinitesimal of an infinitesimal, be dropped from the equation." These observations do not apply to warehouses, where each floor is packed, in which case the columns should be designed for full loads. These remarks are intended to apply to live loads on the lower columns of lofty buildings. The effect of pressure on foundations due to live loads is less than that due to dead loads like those of the walls. An instance of this is given by the writer. The architect of a Chicago building, ignorant of the nature of the soil, did not appreciate the difference between the live and dead load in intensity and effect; the columns carrying the walls, a heavy dead load, settled more than the interior columns and caused much trouble and expense. Therefore foundations in yielding soil under high buildings ought to be proportioned for the imposition of a very small percentage of the moving loads. No doubt the question of the relative imposition of the loads on treacheous soils is one that concerns the architect of every high building of the steel skeleton type.

THE BRITISH ASSOCIATION AT OXFORD.

THE British Association is this week holding its sixty-fourth annual meeting at Oxford. The attendances have not been so numerous this year as when the congress has been held in more populous centres, and on the whole the papers read have not, perhaps, been up to the usual standard of quality. Full reports of the proceedings are given in the last and current issues of the *English Mechanic and World of Science*. In these columns we must restrict ourselves as usual to abstracts of a few of the papers of special interest to our readers. The inaugural address given by the Marquis of Salisbury, the President for the year, in the Sheldonian Theatre on Wednesday in last week, was a lucid and popular survey of the principal problems still unsolved by modern science, including the mystery of the elements, of certain of the lines in the solar spectrum, of the nature of ether, of the age of the earth, and of the development and origin of life.

MAGNETIC VARIATIONS

formed the principal topic of the inaugural address by Professor A. W. Rücker, in Section A, Mathematical and Physical Science. It was now established that even where the surface soil was non-magnetic, and even where geologists had every reason to believe that it lay upon non-magnetic strata of great thickness, there were clearly-defined lines and centres towards which the north-seeking pole of a magnet was attracted, or from which it was repelled. Greenwich and Kew were both under the influence of a widespread local disturbance which culminated near Reading. The questions of the nature of the irregularities of secular change and of the causes of local disturbances were intermingled; and information gained on these points might in turn be useful in solving the more difficult problem of world-wide secular variations. Two causes of regional and local disturbances had been suggested —viz., earth currents, and the presence of visible or concealed magnetic rocks. The two theories were not mutually exclusive. Both causes of the observed effects might, and probably did, coexist. He believed that the presence of magnetic matter, magnetised by induction in the earth's field, was the principal cause of the existence of the magnetic ridge-lines and foci of attraction which for so many years they had been carefully tracing. He suggested that the comparison of the observatory instruments and the fluctuations of secular change outside the observatories could best be investigated under the auspices of a great scientific society.

In Section B, Chemistry, Professor H. B. Dixon, F.R.S., of Owens College, deplored the waste of money by local authorities on technical instruction, and urged that the Universities ought to teach the art of research.

In Section C, Geology, Mr. L. Fletcher, F.R.S., Keeper of Minerals in the Natural History Museum, South Kensington, summed up, in a highly technical address, the more important results which have been arrived at in mineralogy since the report of Professor Whewell on the state of our knowledge in 1832, and contrasted the encouragement given to the study of minerals abroad with the neglect of it in this country.

SYSTEMATIC FORESTRY.

The advantages of systematic and scientific forestry were the chief topics of the opening address in Section D, Biology, by Professor I. Bayley Balfour, of Edinburgh University. He argued that attention to scientific forestry in this country would pay landowners, provide labour, stimulate industries, and increase the national wealth, and that therefore it ought to be fostered by the State, by the endowment of professorships and the establishment of practical schools near forests, and assisted by the practical application of botanical studies. Forests, he said, improve the soil drainage and modify miasmatic conditions. Trees prevent extremes of temperature; they increase humidity, precipitate rainfall, and control waterflow. Scientific sylviculture would reap a harvest from land unsuited to agriculture, otherwise barren and waste, and therefore afforestation need not be prejudiced by increased local rainfall. Of forest produce in 1893 we imported £18,000,000 worth. Much of this we could not produce; there remains a large amount we could. The world's consumption is exceeding its reproduction, and the consumption increases. Substitutes are counterbalanced by greater utilisation—for example, the wood-pulp industry abroad and the manufacture of wood-silk now begun in Great Britain. The amount of State-owned forest abroad is small—in Germany 33 per cent., Scandinavia 15 to 20, France 10, Switzerland 4, Italy not 2. The bulk is in the hands of private owners or of corporate bodies, sometimes controlled or limited by the State. But State example, advice, education, make privately-owned forests as well managed as those of the State. Over 9,000 acres at Windsor are mainly covered with specimen trees. Of the 25,000 acres in the Forest of Dean, a portion supposed to be cultivated for profit results in an annual deficit. As to the 63,000 acres of the New Forest, they exhibit "the triumph of sentiment over common sense." Forestry is handicapped because the crop cannot be reaped within the year. An owner who plants may in a few years have a small return from thinnings, but usually the crop will fall to his successor. But in properly managed timber-growing, areas must be so arranged that some part of the forest will be yielding annually its final return of mature crop. Much land yielding 2s. 6d. an acre would pay better under timber. Net revenues abroad differ: Bavaria, 2,000,000 acres, 5s. per acre per annum; Wurtemberg, nearly 500,000, 11s.; Saxony, rather less than 17s. Our State forests result in a loss, and private returns are not available. He suggested the diffusion of knowledge on the subject, and that forest stations should be established as centres of instruction in the north of England and in Scotland.

In Section G, Mechanical Science, Professor A. B. W. Kennedy, F.R.S., Emeritus Professor of Engineering at University College, London, devoted his address, as president, to the critical side of mechanical training—the training to think about a subject, to write upon it, and to come to a rational decision, by exercising a critical sense of proportion which could be best developed by a course of quantitative experimental work in an engineering laboratory.

THE DEPTHS OF THE ENGLISH LAKES.

Dr. Hugh R. Mill gave the results of a bathymetrical survey of the largest English lakes as follows:—

Name.	Length, miles.	Depth, feet.		Volume, million cubic feet.
		Max.	Average.	
Windermere ...	10·50	219	78½	12,250
Ullswater	7·35	205	83	7,870
Wastwater	3·00	258	134½	4,128
Coniston	5·41	184	79	4,000
Crummock	2·50	144	87½	2,343
Ennerdale	2·40	148	62	1,978
Bassenthwaite...	3·83	70	18	1,023
erwentwater..	2·87	72	18	1,010
Haweswater ...	2·33	103	39½	589
Buttermere	1·26	94	54½	537

There are two main types amongst these lakes, the shallow and the deep. The former, including only Derwentwater and Bassenthwaite, are the broadest of all the lakes, and they only average 18ft. in depth. The bed of these lakes is an undulating plain, grooved and ridged into shallow hollows and low shoals running parallel to the long axis of the lake. The second, or deep type, the shallowest of which has an average depth of 40ft., comprises all the other lakes. They are long, narrow, sometimes winding like Ullswater, or slightly curved in outline like Wastwater and Haweswater. The typical form of the deep class of lake is thus a steep-sided flat-bottomed trough, diversified along the slopes by the still steeper conical mounds of *débris* thrown down at the mouths of streams.

THE FLINT IMPLEMENTS OF NORTH KENT.

A joint meeting of the Archæological and Geological Sections was held on Friday to discuss the plateau flint implements of North Kent. Professor Rupert Jones, in an introductory paper, said Professor Prestwich had shown that superficial soils on the North Downs between Sevenoaks and Rochester contain numerous rudely-worked flints, and that these were derived from a gravel, of very great antiquity, originally formed on the side of the old Wealden-hill range or mountain, which once rose about 3,000ft. above where Crowborough and other hills in Sussex now are. Man existed at the time of these gravels, and used the flints for tools. These gravels and the implements left in them were removed by natural agenies, such as rain, rivers, sea, frost, and ice, and distributed by torrential streams on the chalk slopes. He held that the implements were preglacial in age.

In the discussion that followed, Mr. W. Whitaker considered that man must have existed when the gravels were deposited, but he did not admit that these deposits, although ancient, were found in the pre-glacial or even the glacial age. Sir John Evans, while agreeing with the statement as to the geological features of the case, pointed out that any intervention of a glacial period, as suggested by Professor Rupert Jones, was inadmissible, while the evidence as to the palæolithic age in Suffolk being locally post-glacial was irrefragable. The principal outcome of the recent discoveries was the fact that the existence of palæolithic man could be carried further back in time than the valley gravels, inasmuch as they are now found in gravels on the plateaux at far higher levels.

Professor Boyd Dawkins thought these deposits were not of such high geological antiquity as to be out of the range of the palæolithic period. The argument that the ruder implements are older than the higher types found along with them was negatived by the repeated discoveries of all the forms in question in the same deposits in caverns underneath the stalagmite.

General Pitt Rivers did not think the majority of the stones exhibited were of artificial fabrication; some of them were, but not all, while the geological evidence was more or less shaky.

BORE-HOLE WELLS FOR TOWN WATER SUPPLY

was the subject of a paper by Mr. Henry Davey, M.Inst.C.E. At the Cardiff meeting of this association the author proposed a new system of bore-hole wells for town water supply. Since that time the system has been carried into effect at several places, and he described one of the most important examples of executed work—viz., that of the Netherley Pumping Station of the Widnes Waterworks. Four 30in. bore-holes can be put down in a very small fraction of the time required to sink a 12ft. well. Instead of making a large well, the author puts down four bore-holes to accommodate the pumps for duplicate pumping engines. The bore-holes being completed, the pumps are lowered into them and coupled-up to the permanent engines. Immediately that is done the water found in the bore-holes can be pumped and supplied to the town. Should it be insufficient, then a small well would be sunk in the dry to the bottom of the bore-hole pumps. The bore-holes at Netherley, two in number, are sunk in red sandstone rock, and are placed 20ft. apart, each bored to a diameter of 30in. for a depth of 200ft., and to a reduced diameter of 18in. for a further depth of 200ft. and 300ft. respectively, thus making the first hole 400ft. deep, and the second one 500ft. deep. On the completion of the boring the water stood 70ft. to 80ft. from the surface of the ground, when the quantity pumped by the old engine on the same site was 1¼ million gallons per day. On starting the new pumps, it was found that when pumping 2¾ million gallons per day, the water level was lowered to 100ft. from the surface of the ground.

CRETANS IN PHILISTIA.

Mr. Arthur J. Evans, in a paper on "A New System of Hieroglyphics and a Pre-Phœnician Script from Crete and the Peloponnese," showed two systems of writing represented on diagrams, and observed that, as in the case of the Egyptian and Hittite symbols, the Cretan hieroglyphics fell into distinct classes. He gave reasons based on his archæological researches in Eastern Crete for believing what had long been suspected on historic and linguistic grounds—namely, that the Philistines represented the old indigenous Cretan stock, and that they had here the relics and the writing of the Philistines at home in Egyptian monuments. He asked whether the remarkable parallels observed between some of the Cretan pictographs and the earliest form of Phœnician letters might not best explain themselves by this early Cretan colonisation of the Syrian coasts.

THE ASSOUAN RESERVOIR.

A paper on the geography of Lower Nubia was read by Mr. Somers Clarke, F.S.A., who dealt chiefly with that part of Lower Nubia which will be flooded by the proposed Nile reservoir. The difference in size and colour effect of the scenery in the valley of the Nile above and below Assouan was noticed. The Wadi Kenus, the abode of the Beni Kensi tribe, is nearly coincident with the projected Nile reservoir, and if the proposed scheme is carried out a population of about 30,000, inhabiting a cultivated area of some 10,000 square acres, will be displaced. In the Dodeka-Schœnus there are a number of temples and remains of antiquity, and the district is protected by a line of forts, some of very high antiquity. The existence of Egyptian civilisation side by side with the ruder customs of the natives is especially to be observed in the method of burial. The manner of building houses from lumps of earth, crude brick, with flat wooden or vaulted brick roofs constructed in the same way as those used by the ancient Egyptians, was noticed. Reed shelters are also in use. Not only the unique antiquities, but the present people, with all life, animal and vegetable alike, are affected by the projected reservoir. In view of the contemplated destruction, it is of the utmost importance to make an exhaustive scientific investigation of the valley before it is submerged.—Professor Norman Lockyer asserted that the temples of Philæ were founded about 6,000 years B.C. It had been suggested that a careful topographical and engineering survey should be made of all the temples, and that all the inscriptions should be transcribed and translated. Time and money were required for such a work, but the archæological and historical results would be invaluable.—Mr. F. C. Penrose, F.R.S., P.R.I.B.A., desired to express his full concurrence in what Professor Lockyer had said.

The meeting next year will be held at Ipswich, with Sir Douglas Galton as President; that of 1896 will assemble at Liverpool, and in 1897 Toronto will probably be visited.

◆

REPORTS ON VENTILATION.

In connection with the recent report on the failure of the mechanical ventilation of the Houses of Parliament, the following extracts from the report by the Board of Investigation, composed of leading scientists, engineers, and experts appointed by the United States Government to examine into the various systems of ventilation for the purpose of recommending the most suitable method for the ventilation of the Capitol at Washington, the plenum system, or mechanical ventilation by impulsion, having proved a failure, may be of interest to our readers. The report states that—"It is utterly impossible to thoroughly ventilate such a hall as that of the House, if fully occupied, by any so-called natural ventilation by means of doors and windows."

This is a common-sense decision, as such a very primitive form of natural ventilation could not be safely employed in cold weather, and the statement helps to clear the way for the more scientific and effectual modes of natural ventilation which are now being adopted for public buildings, and which are entirely independent of doors and windows. It was also decided that forcing large volumes of air into the House was not to be recommended, as being dangerous to health and unnecessary. "Were this done," says the report, "perfect ventilation would not be obtained, for this would only provide for the dilution of the impure air, while in perfect ventilation the impurities are not so diluted, but completely removed as fast as formed, so that no man can inspire any air which has shortly before been in his own lungs or in those of his neighbour.

"The relative merits of the upward *versus* the downward systems of ventilation may be estimated from the following considerations:—

"1. The direction of the currents of air from the human body is, under ordinary conditions, upwards, owing to the heat of the body. This current is an assistance to upward, and an obstacle to downward, ventilation. 2. The heat from all gas-flames used for lighting tends to assist upward ventilation, but elaborate arrangements must be made to prevent contamination of the air by the lights if the downward method be adopted. 3. In large rooms an enormous quantity of air must be introduced in the downward method, if the occupants are to breath pure fresh air, or about three times the amount which is found to give satisfactory results with the upward method. 4. In halls arranged with galleries, the difficulty of so arranging downward currents that, on the one hand, the air rendered impure in the galleries shall not contaminate that which is descending to supply the main floor below, and, on the other hand, the supply for the floor shall not be drawn aside to the galleries, is so great that it is almost an impossibility to effect it.

"For these and other reasons the Board are of opinion that the upward method should be preferred."

Tables of phenomenal air-velocities and analyses of mechanical ventilation by impulsion are so many meaningless formulas before *facts* like these.

We have always held that extraction of the hot vitiated air and the products of combustion at the ceiling level, to where they naturally ascend, and admission of fresh air at the lower parts of the building, at a *low velocity*, is the only natural and satisfactory method of ventilation. This opinion is also held by the leading authorities on the subject, ideas regarding the best method to secure ventilation having undergone considerable change within recent years, mechanical ventilating arrangements giving place to simpler and more effectual methods.

The expert who prepared the report on the ventilation of the Houses of Parliament states:—"I think that extraction rightly applied is infinitely better all round than propulsion. I never knew of a system of propulsion pure and simple that effected an efficient and satisfactory ventilation of any large building. In the case of the House of Commons there is no lack of *fresh* air sent in, or that can be sent in; the trouble is rather to get rid of *all* the vitiated air - and that can only be done effectively by a proper system of extraction, by which the vitiated atmosphere would be drawn out from various points. So long as architects employ the plenum system, or propulsion pure and simple, colossal buildings like the Houses of Parliament, the London Law Courts, the National Liberal Club, &c., will continue to be notoriously badly ventilated in every sense of the term.

"This trouble of inefficient ventilation in large legislative buildings, notwithstanding the enormous amount of fresh air that can be passed through them sometimes "without ventilating them," is not at all confined to the Houses of Parliament in this country. For many years the heating and ventilating installation at the Capitol in Washington was the greatest and most perfect example by propulsion pure and simple in the whole world. Two large fans were used for forcing in air under pressure, on the plenum system.

"After years of experience, however, it was found absolutely necessary to adopt extraction [at the ceiling] as well, in order to insure the certainty of the vitiated air being got rid of under all states of the atmosphere."

In a recent work on "Ventilation and Heating" the author says:—

"From a report made by M. Trélat, it appears that the ventilation of the French Chamber of Deputies is in a more unsatisfactory condition than that of the English or American National Assembly Halls.

"The fresh air is delivered at the top of the room, and the currents of air are strong and varied, causing great discomfort.

"The air is delivered by fan propulsion at the ceiling, and is taken out at the floor, giving a downward system of ventilation.

"The apparatus is powerful enough to change the air in the chamber every six minutes; but it can only be worked slowly, owing to the draughts produced, and the air vitiated by respiration is brought back to be reinhaled.

"M. Trélat, as the result of his observations, emphatically condemns downward ventilation."

We have before stated that "engine-driving columns of air through a building is not ventilating it," and these reports furnish additional instances—to the already long list—of the utter inefficiency of the plenum system or mechanical ventilation by propulsion, particularly when on the downdraught principle, the dangers of which are notorious, and we heartily endorse the dictum of the authorities that "the evils of downdraught ventilation cannot be exaggerated, and the employment of it ought, in the interests of the public health, to be made an indictable offence."

"Such a system, if adopted, would prove a standing menace to the health of society."

THE OTIS ELEVATOR.

WE have on our table a copy of a book descriptive and illustrative of the principal buildings of New York, which has been published by the enterprise of the world-wide Otis Elevator Company, Ltd., of Queen Victoria-street. The excellent photo-tint illustrations include many of the most important buildings in the Metropolis of the American continent, and the publication before us is an extract from "King's Handbook of New York City." The more recent structures are illustrated and described, together with a general description of the main features of the city. Particular interest in modern American buildings lies in the fact that the means of communication between the floors is provided for by the Otis elevator, an appliance which is now in operation in nearly all the important structures. Every one of these prominent buildings uses the Otis elevator, we are told, and many of them in numbers which appear surprising to English readers. In every city in America and Europe this elevator has been introduced. It will be superfluous to give a list of the American and English buildings in which the "Otis" elevator is in use. Many of the giant buildings of New York here illustrated, including the Manhattan Life Insurance Co.'s building, the Mutual Reserve building, the American Surety Co.'s offices, Merchants' Exchange Bank, Hotel Savoy, the *World* building, Hotel Majestic, Potter building, the Havemeyer building, the American Tract Society's, &c., are equipped with the Otis. The chief point to notice is that with this form of elevator a given area is made to produce remarkable results in revenue. The Havemeyer building in Church-street, east side, is a good example of the application of seven Otis hydraulic passenger elevators; six of these are arranged round a semicircular area in the building occupied by many eminent business firms and corporations. It is 15 stories in height, fireproof in construction, built of stone and light-coloured brick, with steel frames. Facing three streets, the building is light and cheerful. The owner is Theodore A. Havemeyer, of the great sugar-refining industry.

The rapid increase in height of the New York buildings is seen on looking at the view of the new American Tract Society's building in Nassau-street, which far exceeds in height the old Morse building which is seen next it. The former structure is in course of erection from the designs of Mr. George Read, architect. It is the rapid elevator service which has made these monster buildings possible as well as profitable. Without the Otis elevator they would be quite impracticable, and would remain uninhabited; but with this appliance in regular working order the ordinary staircase service is superseded. Every tenant or visitor entering is provided with an instant and rapid transit to any floor. In the larger buildings several of these elevators are at work; some of them give express services, stopping only at a certain floor, thus affording the visitor the advantage of a speedy and unbroken ascent to the particular floor. The Otis Elevator Co. provide hydraulic, electric, and steam lifts, and among buildings fitted up in London may be named the Albert Gate Mansions, Knightsbridge; the Albert Hall Mansions, Alexandra Hotel, Hyde Park; Euston and Great Northern Hotels, St. Pancras Hotel, Hyde Park Court, Junior Constitutional Club, Piccadilly; New Scotland Yard, Salisbury Estate, in addition to many others, and to buildings in all the chief cities of Europe.

FEUS AND BUILDING LEASES IN SCOTLAND.

THE Select Committee appointed to inquire into the subject of feus and building leases in Scotland have just published their report. The committee concur in the view that it would be desirable to provide by legislation that all existing casualties of superiority should be compulsorily commuted, and that even the stipulation for casualties of fixed amounts becoming due at specified periods, allowed by the Act of 1874, should be prohibited for the future. A majority of the committee consider that the best course would be to provide that compulsory commutation should not be enforced until a casualty of composition should become due, and they would recommend that it should then be in the option of the vassal either to pay the casualty in a capital sum, or to have it converted into an addition to the annual feu duty, arrived at by taking 3 per cent. upon the capital value or amount of the composition. Substantial justice would be done by providing that all future casualties would be compulsorily commuted in respect of a permanent addition to the feu-duty of, say, 1 per cent. on the amount of the composition which had already become due in the ordinary case, and, say, 1½ per cent., where by the terms of the grant a casualty is payable on every sale or transfer of the property. As to the enfranchisement of building leases, the committee advise that provision should be made by legislation for the enfranchisement of building leases in Scotland, whether these leases are for a term of years or upon a tenancy at will. This result might be brought about either by compelling the lessors to sell the value of their interest for a present capital payment, or by providing that the lessee should obtain a permanent right of feu upon his becoming liable for such feu-duty as would represent the value of the rights which the lessor has in the subject when enfranchisement is claimed. The next question adverted to is the acquisition of building land by local authorities. The committee suggest that every elected local authority should be empowered to purchase land by agreement, or compulsorily, for the purposes either of providing sites for dwellings for workmen or other persons, or of otherwise providing for the present or prospective development of the town or village. It appears to the committee that considerable latitude might be left to the local authorities, both as to the purposes for which the land might be acquired, and as to the manner in which it should be dealt with when acquired, whether by letting on lease, feuing, or selling to the persons by whom it was to be occupied.

BUILDERS' CLERKS' BENEVOLENT INSTITUTION ELECTION.

A SPECIAL general meeting for the election of two pensioners on the relief fund, and one child to the benefits of the orphan fund, took place at the offices of the Institution, 21, New Bridge-street, E C., on Wednesday evening, August 15th, the president, Mr. William Shepherd, occupying the chair. There were four candidates for the two vacancies to the widows' pension (of £20 per annum)—viz., Mrs. S. A. Bennett, Mrs. S. Hill, Mrs. S. Lovett, and Mrs. M. Smith. At the close of the poll, Mrs. Hill and Mrs. Smith were declared duly elected. For the orphan vacancy, Thirza M. Smith (a daughter of one of the successful applicants for the pension), being the only candidate, was duly elected by a show of hands. At the close of the proceedings the scrutineers, Messrs. Ernest S. Rider, Thos. Stirling, jun., and H. W. Parker, were thanked for their services, Mr. Roe remarking, with reference to the younger gentlemen (Messrs. Rider and Stirling), how very satisfactory it was to see them following in the footsteps of their respective fathers, by assisting as they had done in the good work in which they had been engaged that evening. A hearty vote of thanks was also accorded to the President for his kindness in attending, and presiding so efficiently, as chairman of the evening.

"KRUSHITE."

MR. JAS. T. PEARSON, engineer, Burnley, has forwarded to us samples of a material which is likely to be extensively used, called "Krushite," now advertised in our columns. This material, which is made of varying degrees of fineness, has been found to be of great value to quarry owners and builders in sawing and polishing granite, stone, marble, and other hard materials in lieu of sand. It is stated that a block of granite can be sawn with "Krushite" at the rate of 4in. in depth per hour, and hard gritstone at 9in. in depth per hour with 1A blades. The "Krushite" is used also in sand-blast apparatus instead of sand, and is being substituted for diamond drills in boring. One ton of this material is equal to 300 tons of the sharpest sand. The specimens sent to us are of nine different sizes or degrees of fineness, varying from the finest emery powder or pepper to the size of small shot or rape seed, and used for different purposes. "Krushite" is without points or edges, free from rust, and will not stain; it is chilled to intense hardness without being brittle, and its action is to roll between the block and saw blade or rubber; hence it retains its spherical shape and cutting power. Unlike sand or emery, it does not become embedded in the blade or rubber, but rolls backwards and forwards, creating a crushing action on the blocks sawn. It is used like sand, and the same machinery is applicable. The wear and tear of the blade or rubber are much lower than when sand is used. Considering the economy of "Krushite" for all sawing and polishing operations on stone, being capable of doing the same amount of work as diamond saws at one-tenth the cost, we have great confidence in recommending it to all quarrymen, builders, and others who are engaged in cutting or polishing operations. Its extreme hardness and the sphericity of its grains make it superior to sand, which often cuts or spoils the face of the stone or blade. We may add that samples of the Krushite may be obtained gratis from the manufacturer.

Messrs. Ralph and Sons, contractors, Plymouth, have commenced extensive alterations at Truro railway station on behalf of the Great Western Company. Additional goods relief lines will be laid down, and by a subsequent contract it is proposed to build a new stone viaduct over the Fal valley, on the north side of the existing wooden viaduct, which will then be demolished.

BRITISH BUILDING STONES.—XII.

SCOTLAND (*continued*).

No.	Quarry.	County.	Geological Formation.	Description.	Colour.	Weight of a Cube Foot.		Water Absorbed per Cube Foot.	No. of Cube Feet to 1 ton.		Remarks. Where used, analysis, crushing strain in tons per ft. super., cost per cube foot.
						Dry.	Wet.		Dry.	Wet.	
						lb. oz.	lb. oz.	Pints.	ft. in.	ft. in.	
390	Hermand ...... West Calder.	Edinb'rgh	Oil-shale series. *Lower Carboniferous.*	Moderately fine-grained sandstone; very silicious; no mica; bedding not observable.	Light greenish-grey.	141 12¼	143 4¾	5¼	15 9½	15 1½	Bank of Scotland, Calton Gaol, St. Mary's Cathedral School, West Port, and St. Andrew's Free Churches, Edinburgh. *Cube stones*, under 5ft. long and not exceeding 15c.ft., 1s. 2d.; not exceeding 60ft., 4s.; under 12ft. long and not exceeding 15c.ft., 3s. 3d.; not exceeding 60ft., 5s. 9d. *Broad stones*, per superficial foot, in sizes not exceeding 7ft. long and 5ft. broad, under 10 superficial feet and 6in. thick, 9½d.; up to 14in. thick, 1s. 8d.; under 35 superficial feet and 6in. thick, 2s. 6d.; up to 14in. thick, 4s. 3d. *Long stones*, per superficial foot, not exceeding 26in. broad, under 5ft. long and 7in. thick, 9d.; 11in. thick, 14d.; under 12ft. long and 9in. thick, 2s. 5d.; 11in. thick, 3s. Stones of *random* lengths not exceeding 5ft. long and 26in. broad—ashlar, 12in. high, 7d.; if cut natural, 8d. per lineal foot; cornice or cope, 6in. thick, 8½d. per super. foot; above 26in. broad will be charged as "broad" stones. The *sundries* in this quarry are founds, rybats, scuntions, jambs, plats, and steps. Ten per cent. has been added to above prices for some time past. Analysis:—Silicious matter, 94·68; carbonate of iron, 2·19; alumina, 0·92; carbonate of lime, 1·56; carbonate of magnesia, 0·27; moisture and loss, 0·38. Crushes with 430·5 to 496·8 tons (B). Shows signs of weathering in Pillars in Meadows, 1888 (Craig).
391	Hildasay......	Shetland..	Granite.	Quartz orthoclase, hornblende, and biotite.	Grey, with greenish tinge.	170 6	170 11½	¼	13 1½	13 1¾	Used in Aberdeen for monumental and decorative polished work.
392	Hill o' Fare. Banchory.	Aberdeen.	Granite.	Much transparent quartz; pink orthoclase, biotite.	Light pink.	161 10	162 3¾	½	13 9¾	13 10¾	There is very little mica in this granite. It is extensively used for monumental work by the Aberdeen granite polishers. Harris, in "Granites," p. 87, says the rock is of a "dark red" colour. The specimen examined here is of a pale salmon tint.
393	Humbie .... Aberdour.	Fife.........	*Lower Carboniferous.*	Fine-grained soft sandstone; small pieces may be crushed between the fingers; minute brown specks in matrix; bedding not distinct.	White.	127 4	137 3¾	8	17 7¼	16 3¾	Royal Exchange, Glasgow; spire of Tron Church. Cube stones: *Clean* rock, under 10ft. cube, 1s. 1d.; *common* rock, 10d· Under 35ft. cube, clean rock, 2s. 3d.; common rock, 1s. 7d. (length not to exceed twice the breadth, or breadth twice the thickness). Broad stones, not confined to lengths, 6in., 9d.; up to 12in. thick, 1s. 2d. per super. foot. Long stones, under 4ft. 9in. long, 6in. thick, 9d.; 12in. thick, 1s. 2d. per super. foot. Stones 10ft. 10in. long 8in. thick, 1s. 10d; 12in., 2s. 2d. per foot, in clean rock. Monumental stones and columns 20 per cent. additional. When the breadth of any stone exceeds three times the thickness, the thickness will be charged at one-third the breadth. Stones cut on natural bed, depth not to exceed twice the breadth, 10 per cent. additional; depth not to exceed three times the breadth, 15 per cent. additional. Stones cut parapet, 10 per cent. additional. Special quotations for large quantities.
394	Huntershill. Bishopbriggs.	Lanark ...	Coal Measures. *Carboniferous.*	Fine-grained micaceous sandstone, brown spots; rubs smooth. No bedding observable.	White, with grey tinge. Light grey.	136 11¼ 127 1¼	144 0½ 134 3	5⅞ 5⅝	16 4½ 17 7¾	15 6 16 8½	Cube stones under 15ft., 1s. 2d.; 20ft., 1s. 4d.; 30ft., 1s. 10d.; 40ft., 2s. 5d.; 50ft., 3s. 3d.; 60ft., 4s. 3d. per cube foot. Broad stones under 6ft., 6in. thick, 8d. per super. foot; up to 35ft. at 2s. 10d. Stones under 6ft., 14in. thick, 1s. 6d.; up to 35ft. and 14in. thick, 4s. 3d. Stones under 6in. thick charged as 6in. Long stones, 4ft. by 12in. by 7in., 3s. each; up to 24in. by 11in., 9s. 8d. each; 12ft. by 12in. by 7in., 20s. 9d.; up to 24in. by 11in., 74s. 9d. each. Columns, 6ft. by 15in. by 15in., 18s. 11d.; 6ft., 24in. by 24in., 63s. 11d. each; 15ft. by 15in. by 15in., 109s. 10d.; 15ft. by 24in. by 24in., 325s. 10d. each. Wheeling steps, 4ft. long, 18in.—6in. broad, 7in. thick, 3s. 3d.; 32in.—6in. broad, 5s. 7d.; ditto 6ft. long, 6s. 1d. and 10s. 6d. respectively *each*. Stones cut parapet 10 per cent. additional. "All material sent by waggon charged 5 per cent. extra for haulage."
395	Kemnay ...... Aberdeen (17).	Aberdeen.	Granite.	White quartz and felspar, with biotite in small specks scattered through the mass.	Light grey.	163 11¼	164 8	¾	13 8	13 7¾	Used for docks and other engineering works. Forth Bridge piers; St. Mary's R.C. Church, Aberdeen, 1860. Crushes with 961·9 to 1285·8 tons (B).
396	Kinneil ...... Bo'ness.	Linlithgow.	*Lower Carboniferous.*	Fine even-grained sandstone, glassy quartz grains in apparent contact; no matrix; no bedding observable.	White, with greyish tinge.	130 5	139 5¾	7¼	17 2	16 0¾	Town-hall, public offices, churches, dwelling-houses, and principal buildings in the locality. Quarry turns cut stone "of any requisite thickness." Cube stones from 5ft. to 10ft., 1s.; 10ft. to 15ft., 1s. 1d.; 15ft. to 20ft., 1s. 4d.; 20ft. to 25ft., 1s. 9d.; 25ft. to 30ft., 2s. 4d.; 30ft. to 35ft., 3s. Length not to exceed twice the breadth, nor breadth twice the thickness. Prices net at quarry. (For prices of other stones see Maiden Park, No. 403. Worked by same lessee at same rates for both quarries.)
397	Kinsteary ...	Nairn......	Granite.	Glassy quartz, with pink orthoclase and biotite.	Pink, spotted with black.	163 7¼	163 15¾	⅝	13 8¼	13 7¾	Used in Aberdeen for monumental and other polished work.
398	Kirriemuir ...	Forfar ...	Old Red Sandstone. *Devonian.*	Moderately fine-grained micaceous sandstone; compact matrix.	Brownish-red.	141 9¾	148 5½		15 9¾	15 1¼	Bank of Scotland, Union Bank, Lisden House, Kirriemuir. Cube stones, 1s. 1d.; ordinary rybats canted, 2ft. tails, 8in. heads, 10d. per linl. foot; flat ditto, 1s. 1d. per linl. foot. Cut rubble stones, 4s. per load, to average a ton. Coursers, 6in. to 7in. high, and 6in. to 8in. on bed, 4½d. per foot linl. Prices for delivering to rail, Kirriemuir Station.
399	Laggan......... Crieff.	Perth	Old Red Sandstone. *Devonian.*	Fine-grained compact sandstone; mica plates parallel to bedding.	Purplish, brown.	155 7¼	159 10	3⅝	14 5	14 0¼	Roundelwood (a villa in Crieff); Mr. Conrie's house and shop, King-street; numerous villas and houses in the locality. Cube stones under 5ft., 1s. per foot; under 10ft., 1s. 6d.; long stones, 3ft. to 4ft. long, 12in. by 6in., 7d.; up to 8ft. long, 12in. by 6in., 1s. 6d. per foot; common founds, 2s. 9d.; rubble, 2s. 2d.; square ditto, 3s. 6d. per ton; half-round cope, 12in. by 6in., 6d. per foot; jambs, 3ft. by 18in. by 5in., 2s. each; jamb lintels, 8in. by 8in., 6d. per foot; monumental stones, 6in. to 9in. thick, 10d. to 1s. 2d. per foot; pavement under 6ft., 4½d.; under 12ft. 6d. per super. foot. The prices are at quarry. Add 1s. 6d. per ton for delivery to rail at Crieff station. "The rock can be got almost any thickness."
400	Lamberkin ... Perth.	Perth	Old Red Sandstone. *Devonian.*	Fine-grained micaceous sandstone; rubs smooth; bedding not distinct.	Blueish grey.	143 12¼	150 5½	5¼	15 7	14 10	Dupplin Castle ("Elizabethan, and polished round and round"); extensions to Blair Atholl and Glenlyon Castles, Freeland House, and many private houses in Perth and the neighbourhood. Cube stones, under 10ft., 1s. 2d.; under 15ft., 1s. 9d.; other stones by special agreement; common rubble, 2s. 3d.; heavy ditto, 2s. 3d.; square cut ditto, 3s. 6d.; foundation stones (common), 2s. 3d. per ton: common rybats, natural bedded, 10d.; cant rybats, 9d.; scuntions, 7d. each. Sills and lintels, 12in. by 6in., under 5ft. long, 8d., and for every additional foot of length, 1d. per foot extra, and for every additional inch in thickness 1d. per foot extra.

No.	Quarry.	County.	Geological Formation.	Description.	Colour.	Weight of a Cube Foot.		Water Absorbed per Cube Foot.	No. of Cube Feet to 1 ton.		Remarks. Where used, analysis, crushing strain in tons per ft. super., cost per cube foot.

401	Lauriston ... Montrose.	Forfar ...	Old Red Sandstone. *Devonian.*	Fine-grained micaceous sandstone; bedding not observable.	Dark purplish grey.	141 13¼	148 11¼	5½	15 9½	15 0¾	Brotherton Castle, Ecclesgruig House, Fettercairn House, Lauriston Castle, Drumtochly Chapel, part of Sunnyside Asylum. Cube stones not above 5ft. long, and not more than 10ft. cubic, 1s. 2d.; flat rybats, 2ft. long, 12in. to 14in. high, 8in. to 10in. on head, 1s. 6d.; flat ashlar, 7in. to 8in. on bed, 9d. per super. foot; started rybats, 2ft. long, 12in. to 14in. high, 6in. to 8in. on head, 1s.; started ashlar, 7in. on bed, per super. foot, 8d.; courses, 6in. to 8in. high, 4½d. per lineal foot; extra-sized rybats, ashlars, and putt stones, 1s. 2d. per cubic foot; crub, 15in. by 5in. per lineal foot, 7d.; garling, 10in. broad, 3in. to 4in. thick, 6d. per lineal foot; "ruble," 2s. per ton; tabling, 12in. to 14in. broad, 4in. thick, 6d.; broad stones, under 6ft. 6in. thick, 8d.; 9in. thick, 11d.; under 24ft., 6in. thick, 1s.; 9in. thick, 1s. 3d.; long stones, all 14in. by 7in., 3ft., 2s. 3d.; 4ft., 3s.; 5ft., 4s. 2d.; 6ft., 5s. 6d.; 10ft., 13s. 11d. Add 2s. per ton cartage to Perth station, at 12ft. cube to the ton. Quarry beds usually from 12in. to 16in. thick. They sometimes rise to 2ft. and 2ft. 6in.
402	Ley of Hallyburton Coupar Angus.	Forfar ...	Old Red Sandstone. *Devonian.*	Fine-grained micaceous sandstone; rubs smooth; bedding may be observed.	Grey.	149 7¾	155 8	4⅞	14 11¾	14 4¾	Belmont Castle and stables for Right Hon. H. C. Bannerman. This stone can be "cleaned," "tooled," and "polished." It will dress to any form. "It is not so soft," keeps its colour long, is strong and durable, beds from 3in. to 5ft. and 6ft. deep. Quarry is three miles from rail. Cube stones up to 10ft. 1s. in quarry, 1s. 2d. on rail. Common corners in quarries, 24in. by 12in. by 10in. on head; if not natural bedded 10d. each, 1s. on rail; natural bedded, ditto, 1s. in quarry, 1s. 2d. on rail truck.
403	Maiden Park Bo'ness.	Linlithgow.	*Lower Carboniferous.*	Fine-grained sandstone, ochrey matter in matrix and in bedding, which is distinct.	Cream, striped with brown, parallel to bed.	131 5¼	139 3½	6⅜	17 0¾	16 1	Town Hall and buildings, Bo'ness. "Ruble," 1s. 9d.; rough founds, 3s. 6d. per ton; dressed founds, 6in. to 8in. thick, 8d. per super. foot. Chimney heads, plinths, and skews, 12in. by 5in., 6d. per lineal foot. Ashlar, 12in. by 6in., 7d.; 12in. by 8in., 8d.; 12in. by 9in., 9d. per lineal foot. Courser rybats and corners, 1s. 2d. each. Scuntions and backs, 9d. Long stones, 3ft. 6in. by 12in. by 7in., 7½d. per super. foot; 4ft. 6in. by 12in. by 7in., 8½d. per lineal foot; up to 9ft. by 12in. by 8in., 1s. 4d. per lineal foot. All other lengths, breadths, or thicknesses proportioned to above rate. Prices are net at quarry. (See Kinneil, No. 396.)
404	Mill Head ... Brechin.	Forfar ...	Old Red Sandstone. *Devonian.*	Fine-grained sandstone; glassy quartz and felspar; bedding not observable.	Dark grey.	140 4½	146 10½	5⅜	15 11½	15 3¼	
405	Montgomery. Tarbolton.	Ayr.........	Permian.	Fine-grained sandstone, no mica; bedding not distinct.	Brownish red.	116 1¾	128 7¼	9⅞	19 3½	17 5	Parish church, Conservative club, Troon; school and offices, Kirkcaldy; Burgh Buildings, Whiteinch, Glasgow; church, Paisley. Cube stones under 15ft., 8d.; 20ft., 10d.; 30ft., 1s. 1d.; 40ft., 1s. 6d.; 50ft., 2s.; 60ft., 2s. 8d. Broad stones under 6ft., 6in. thick, 5d.; 10in. thick, 8d.; under 35ft., 6in. thick, 2s.; 10in. thick, 2s. 6d. per super. foot. Long stones 4ft. by 12in. by 7in., 1s. 10d.; up to 24in. by 11in., 6s. 11d.; 12ft. by 12in. by 7in., 14s. 9d.; up to 24in. by 11in., 53s. each. Columns 7ft., 15in. by 15in., 16s. 10d.; up to 14ft., 6in. by 15in. by 15in. 72s. 4d. Columns 7ft. by 24in. by 24in., 53s. 6d.; up to 14½ft. by 24in. by 24in., 20s. each. Wheeling steps, founds, scuntions, coursers, rybets, jamb lintels, jambs, pavements, and copes at quarry list prices on trucks at quarry. All stones whose height exceeds the width on bed are charged 10 per cent. additional.
406	Myrestone ...	Forfar ...	Old Red Sandstone. *Devonian.*	Fine-grained micaceous sandstone, rubs smooth; black carbonaceous specks; no bedding observable.	Bluish grey.	150 5½	154 1¼	3	14 10½	14 6½	"Sized" stones containing not more than 10ft., 2½in. thick, 7d.; 3in., 8d.; 4in., 9d.; 5in., 11d.; 6in., 1s. 1d.; 7in., 1s. 3d.; 8in., 1s. 6d.; 9in., 1s. 9d., single faced, per super. foot. Stones up to 30ft. super and 9in. thick (these latter at 2s. 4d. per foot). Double facing under 25ft., 2d.; above 25ft., 3d. extra. Platts, sawn breast, 6d. per lineal foot extra; planed breast, 9d.; bottled, 1s. Selected stones for monuments and pavements—common, medium, and undersize—at quarry list prices, free on rail at Forfar. No stone quoted more than 9in. thick. The quarry is chiefly a pavement quarry. Work is stopped here at present.
407	Newstead ... Melrose.	Roxburgh	Old Red Sandstone. *Devonian.*	A rough unequal-grained conglomerate; no bedding observable.	Mottled brown with slate-coloured patches.	160 10½	164 1¾	2¾	13 11¼	13 7½	The stone from Quarry-hill is sold at 4s. per yard super., or about 5½d. per foot for coursers or blockers from 6in. to 9in. high, 1ft. to 3ft. long, and 6in. on bed of stone. Delivered to rail.
408	Newton ...... Thornhill.	Dumfries	*Permian.*	Fine-grained sandstone; rubs fairly smooth; no mica; bedding indistinct.	Brownish-red.	128 9¼	137 12¾	7⅜	17 5	16 3	Station and hotel; new Memorial Church; Crichton Royal Institution, Dumfries; Parish Hall, Thornhill; church at Greenock; villas at Bridge of Weir. Quarry beds from 1ft. to 4ft. thick. Sized lineal, superficial, and cube stones. All under this head, although less than 12in. broad, will be charged as if 12in. broad, and if more than 12in. broad, the same rate per superficial foot. From 1ft. to 6ft. by 12in. by 8in. per linl. foot, 6d.; from 1ft. to 6ft. by 12in. by 10in. per linl. foot, 7d.; from 1ft. to 6ft. by 12in. by 12in. per linl. foot, 8d. The same lengths 18in. square at the same rates per cubic foot. The pavement in this quarry is sorted as common, 3in., 4in., street, sized flags, and division flags. "Rubble" is quoted at 1s. per ton; thoroughbands at 1s. 6d. per ton; kitchen jambs, kitchen jamb lintels, and room jamb lintels are from 5d. to 7d. per linl. foot; ridge stones, 3½d.; 1s. per ton charged for delivery to rail.
409	Old Quarry. Locharbriggs.	Dumfries.	*Permian.*	Fine-grained sandstone; does not rub smooth; bedding not distinct.	Brownish red.	125 9	135 12¾	8¾	17 10	16 5¾	Standard Insurance Offices, Sun ditto, Trinity Shipping ditto, Glasgow; Gartloch Lunatic Asylum for City of Glasgow; Princes-street Railway Station, Edinboro'; Lochend School, Leith; County Buildings and Post-Office, Dumfries. Cube stones, not sized up to 15ft., 8d., rising in price to 80ft. at 3s. per foot. Superficial stones from 6in. thick at 4½d. per foot, up to 10in. thick at 7d. Long stones from 6ft. by 12in. by 8in. at 6d. per lineal foot, up to 10ft. by 12in. by 12in. at 1s. 6d. Pavements from 1s. 6d. to 2s. 8d. per yard. Scuntions, rybats, coursers, skews, jambs, &c., at quarry list prices, free on rails, Locharbriggs. In this quarry, special attention is given to sawn stone. "In over 90 per cent. of cases the stones are perfectly just and polished when they leave the machine." Mullions, monumental stones, and parapet ashlar sawn at the rate of 2½d. per foot super. Analysis:—Silicon oxide, 98·19; iron oxide, ·89; moisture, ·92.

BOOKS RECEIVED.

The *Engineering Magazine* for August (London: George Tucker, Salisbury-court, Fleet-street) contains, amongst other articles on industrial matters, a first paper by Mr. Dankmar Adler, on "Theatre-Building for American Cities." Mr. Adler is a very successful theatre designer, and, as he tells us, it is his good fortune to have carried out several successful theatres and public halls in America. We may be, therefore, sure that what he tells us, derived from his own personal observation and independent thought, will be to the point. Theatre design and building is not more difficult, as he says, than any other kind of building if one's action is based not merely on recorded precedent, but upon extensive observation. So long as theatres are ventures for pecuniary gain, the buildings will be subordinate to the ideas of projectors, owners, and managers, which are mainly to seat the greatest possible number in the smallest space, and for the smallest outlay. The architect has, of course, to submit to these conditions. Mr. Adler points out the lines of development which should be followed in designing an American theatre, and his views are of value to all theatre architects and proprietors. We shall probably refer to a few of the principal points in another article. ——*Papers and Addresses*, by Lord Brassey, K.C.B., D.C.L.; *On Work and Wages*, edited by G. J. Potter (London: Longmans, Green and Co.)—This collection of addresses and papers on work and wages illustrates various phases of the question. The author says: "An hereditary connection with industry and enterprise suggested the first speech delivered in the House of Commons, and the subsequent publication of a volume on 'Work and Wages.' Through a period extending over a quarter of a century a year has rarely passed without calls for addresses on Labour questions." The first speech on "Trade Unions, and the Cost of Labour" was made in the House of Commons in 1869, since which time various other addresses have been given on "Wages," "Price of Labour," "Trades Unions," "English and Foreign Labour," "Depression of Trade," "Agricultural Holdings," &c., at Trade Union Congresses, Institutions, &c. Others are the reprints of papers in the *Times*, *Nineteenth Century*, &c. The volume will be found of interest to those interested in this important economic and industrial movement, both as giving a review of the history of labour, and as showing the change of public opinion. The introduction by Mr. George Howell, M.P., is interesting in this connection, and the papers and addresses of Lord Brassey are of value as embodying the views of a practical and experienced politician and man of business.

◆

A memorial reredos of alabaster and marble is about to be placed in the fine 15th-century parish church of St. Just, near the Land's End. The architect is Mr. E. Sedding, of Plymouth.

INSTRUMENT FOR DRAWING HYPERBOLAS AND ELLIPSES.*

YOUR correspondents and others may be interested to read a description of an instrument which I have devised for drawing hyperbolas and ellipses. A, Fig. 1, is a T-square. Mounted on the stock is a clock barrel, B, around which is wound a double line, the two ends of which are fastened to it. The saddles *a* and *b* are adjustable, and may be set at any desired distance apart, being fastened to the blade of the square by the set-screws *s s*. These saddles carry small eyes, *c* and *d*, through which the line passes, both parts passing through *c*. Fig. 2 shows the position of the line when the instrument is not in use, the spring causing the barrel to revolve in the direction of the arrow, keeps it taut. Fig. 2 is very much exaggerated, in order that the reader may see clearly how the line is threaded through the eyes.

Referring to Fig. 1, if we take hold of the line at any point *p*, and pull it, the barrel will revolve in a direction contrary to that indicated by the arrow, and the part of the line *r* will pay out round the eye *c* while the part *r′* will pay out round the eye *d*, and since these two parts come off the barrel together, their lengths increase at the same rate—i.e., the difference between their lengths is constant; therefore the point *p* traces the hyperbola *e p f*. To prevent the pencil from slipping on the line, a turn should be made round it. For accurate work, the line may be of surgeon's silk; for blackboard purposes, a gut line may be employed. The other branch of the hyperbola *e′ p′ f* is described by taking hold of the line at a point, *p′*, at a distance from *c* equal to that which was measured from *d*. The broken lines *c p′ p′ d* show the position of the line when the other branch of the curve is drawn.

A point midway between *c* and *d* will describe a straight line, *g h*, the conjugate axis of the hyperbola. If the barrel be prevented from revolving when the line is extended to any point, and the pencil be allowed to slide on it, it will describe an ellipse according to the well-known method, and the ellipse will intersect the hyperbola perpendicular to it at *p* and *p′*.

If the instrument be reversed, the remaining half of each curve may be described as in Fig. 3, which illustrates confocal ellipses and hyperbolas drawn with this instrument, all the ellipses being normal to all the hyperbolas at the points of intersection.

◆

The Admiralty have decided to strengthen the defences of Sheerness Harbour and the river Medway by constructing a boom to bar the passage of the river in the event of Britain being engaged in hostilities. The boom will stretch from Port Victoria, at the upper end of Sheerness Harbour, to Stangate Creek, on the opposite bank of the Medway, and several obsolete gunboats, together with an immense quantity of timber, will be utilised in its construction. The shore anchorages for the boom are estimated to cost £6,000, and the Admiralty have accepted the tender of Mr. J. Bligh, of Eastchurch, near Sheerness, for the execution of this portion of the work.

Building Intelligence.

Hythe, Kent.—The Roman Catholic School and Church of the Virgin Mother of Good Council, Hythe, was opened last week. The buildings have been erected from plans by Mr. A. E. Purdie, of Harlesden, carried out by Messrs G. H. Denne and Son, of Deal, at a cost of £2,587. The external walls are faced with red bricks, relieved with moulded red brick stringcourses, &c. The church consists of a nave, 62ft. by 22ft.; chancel, 20ft. 6in. by 18ft.; the Lady chapel, 15ft. by 11ft.; and sacristy, 15ft by 11ft. Sittings are provided for 300 persons, besides the choir gallery at the west end. The high altar and reredos have been designed in keeping with the church, and are enriched with panels painted in oil colour by Mr. J. L. Ryan, of London and Seabrooke. The principals are of pitch-pine stained and varnished. The church is built in the Early English style. Over the chancel roof rises a belfry, which is covered with lead and crocketed. The schools provide for the education of 225 children, and have been built in accordance with the demands of the Education Department, as regards class and cloakrooms, playgrounds, light, ventilation, &c.

Newbury.—The new technical institute was opened on Wednesday afternoon by Mr. Alfred Waterhouse, R.A., F.R.I.B.A., of Yattendon Court, in the presence of a goodly assemblage of townspeople. Mr. Waterhouse delivered an interesting address, in which, having alluded to the historic associations of Newbury, he urged the importance and value of the study and appreciation of nature, and referred to art as a source of pleasure. He urged the desirability of such technical schools as a means of meeting foreign competition, and remarked that there is a great future for artistic pottery and metal-work as village industries. The institute, of which Mr. Walter H. Bell, of the Market-place, Newbury, is the architect, adjoins and partly incorporates the old Literary and Scientific Institution. On the ground floor there are three large classrooms. The museum will be located in the rooms hitherto used for the art classes. The school of art, 42ft. by 28ft., is on the first floor, and is lighted by three large windows. Adjoining are a gallery and the art-master's room, with lavatories and cloakrooms. The caretaker's apartments are situated on the top floor of the institute. The contractor was Mr. Samuel Elliott, of the Albert Steam Joinery Works, Newbury.

Winsford.—The foundation stone of the new Technical Institute, the gift of Mr. Joseph Verdin, was laid last week in the High-street, Over Winsford. The style will be Renaissance, and mullioned and transomed windows are provided throughout the three principal elevations, except those of the art school, which will have wooden frames. The front elevation and the two large gables on each side are to be entirely faced with Mr. J. C. Edwards' Ruabon red stock bricks, and all dressings are being executed in terracotta from the same firm. The roofs are to be covered with deep red Ruabon roofing tiles, with approved ridging at the apex. Internally, the joinery will be of St. John's pine. The building is to be warmed and ventilated by the Blackman Smead Company, of London and Manchester. In the basement floor are arranged the joiners' workshops, with wood store, 24ft. by 20ft.; plumbers' and fitters' workshops, 20ft. by 13ft., with storeroom, coal and coke store. On the ground floor there is a top-lighted gymnasium, 50ft. by 37ft., with separate boys' and girls' dressing-rooms and lavatories; also provided with gallery 37ft. by 9ft. Four class-rooms, each 22ft. 6in. by 21ft., are provided. By Peace and Norquay's folding partitions, the superficial area of these rooms can be thrown into a large room 88ft. by 21ft. for examination purposes and prize distributions. A chemical laboratory, 24ft. by 19ft. 6in., is placed at the end of the boys' corridor. For the teaching of art three large rooms are provided. The work will be executed by Messrs. James Fowles and Sons, Winsford, from the designs and under the supervision of Messrs. Woodhouse and Willoughby, FF.R.I.B.A., of Manchester, chosen in open competition.

◆

In the House of Lords, on Tuesday night, the London County Council (General Powers) Bill and the London Streets and Buildings Bill were read a third time. Both measures now only await the Royal Assent to become law.

ARCHITECTURAL ASSOCIATION EXCURSION SKETCHES. — BUSINESS PREMISES, OLD BOND STREET, W.— DESIGN FOR A COUNTRY HOUSE.—MAYFIELD CHURCH.—PADDINGTON GREEN CHILDREN'S HOSPITAL.—SCHOOL OF COOKERY, MALVERN. — COTTAGE AT RAINHILL.— OLD FURNITURE FROM THREE COUNTRIES.

Our Illustrations.

ARCHITECTURAL ASSOCIATION SKETCHES.—II.

(See description of the Architectural Association's Excursion in Somersetshire on p. 205.)

BUSINESS PREMISES, OLD BOND STREET, W.

These art showrooms, with residences above, have been built in Old Bond-street, W., from designs by Messrs. Wimperis and Arber.

DESIGN FOR A COUNTRY HOUSE.

This is an illustration of the garden front of a house which was designed for a gentleman whose family had owned Bramhall Hall, and who wanted a house with its elevations based on this fine old mansion. The walls would be for the most part built of brick, with the overhanging walls of studwork, the whole covered with half-timber work. The roofs would be tiled, and the woodwork throughout would be stained dark grey and oiled. The illustration is from a water-colour drawing in this year's Royal Academy, by the architect, Mr. R. A. Briggs, F.R.I.B.A., of 2, Devonshire-square, E.C.

MAYFIELD FREE CHURCH, N.B.

No description of this church, designed by Mr. Hippolyte J. Blanc, A.R.S.A., of Edinburgh, has come to hand.

PADDINGTON GREEN CHILDREN'S HOSPITAL.

This building which we illustrate to-day, now in course of erection, will stand on the site of the former hospital and land adjoining, situated at the corner of Church-street and Paddington Green. The previous building was ill-adapted for its purpose, being nothing more than an ordinary dwelling-house altered to serve as a hospital. The perspective view shows, as well as the part now being erected, and which is shown on the plans, the proposed future extension to Church-street. The basement is given up to the kitchen, scullery, pantry, housekeeper's rooms, and stores. The cooking it is proposed to do with gas. On the ground-floor is the board-room, and also the secretary's and surgeons' rooms. The out-patients' department at the back of the new building has been remodelled. On the first and second floors will be the two large wards, each 56ft. long by 24ft. wide by 15ft. high. The walls will be lined to a height of 5ft. with glazed bricks, and above that with cement. The ward floors are to be of marble "Terazzo." The heating of the large wards will be by means of Shorland's Manchester stoves, two being placed centrally in each ward. The ventilation will be assisted by extract flues next ceiling and inlet flues under every bed, formed of glazed stoneware pipes. On the third-floor will be fourteen nurses' bedrooms (each with a fireplace) and a good nurses' sitting-room. On the fourth floor, reached by an outside staircase, is the isolation ward, with scullery, nurses' room, bath-room, w.c., &c. The elevations will be faced with dark-red Ibstock bricks, and a lighter red for the strings and cornices. The roofs are to be covered with green slates. The contract (just under £11,000) is being carried out by Messrs. Mark Patrick and Sons, of Westminster Bridge-road, and the architects are Messrs. Salter and Adams, 28, Woburn-place, Russell-square, W.C.

SCHOOL OF COOKERY.

The residential school for household and domestic training which we illustrate stands on the Herefordshire side of the Malvern Hills, commanding extensive views of the surrounding country. The building, which is just completed, has been erected by Mrs. Buck and Miss Brander, and is under their management. Mr. David Lewis, of Colwall, has carried out the work under the superintendence of Messrs. Roberts and Simpson, architects, of Leicester.

COTTAGE AT RAINHILL, NEAR LIVERPOOL, FOR MR. FREDK. STAPLETON-BRETHERTON, J.P.

This cottage is now being erected on the estate of Mr. F. Stapleton-Bretherton. It is built of Rainhill stone, quarry faced, with sawn dressings, moulded mullions and heads. The roofs will be covered with blue Velenhelli slates. The builder is Mr. Pilkington, of Rainford, near St. Helen's, and the architect Mr. Beesley, of Warrington.

OLD FURNITURE FROM THREE COUNTRIES.

The Armchair, with high back, comes from the South of France, and its date is about 1580. The stiles and framing are inlaid with marquetry. Its height is 3ft. 10in., and the width is 1ft. 9½in. The introduction of the arch work between the columnar legs under the seat imparts an element of strength which is sometimes wanting from many chairs of like character; while the repetition of this form in a modified degree in the back gives this piece of furniture a pleasing unity of design. The carved ornament, similar to the egg-and-tongue round seat-board, and the foliated pediment with its central mask, are both evidences of the delight the old craftsmen took in adorning their work. It was bought from the sale of the Soulages Collection for £25, and is in the South Kensington Museum, as are the other two examples given on our sheet.—The Cradle, of English workmanship, is perhaps one of the finest specimens of oak cradles in this country. It belonged to Edward Radcliffe, Earl of Derwentwater, whose initials, "E. R.," surmounted by a coronet, and flanked by winged figures, are carved over the footboard. It has been lent to the museum by Mr. R. D. Radcliffe. In this connection we may mention that in the Building News for March 8, 1889, we published a drawing of an oak cradle of the time of William and Mary, and on Dec. 21, 1883, we illustrated the Royal cradle of Henry V.—The Armoire, or Buffet, in carved oak, of Flemish character, is an early piece of cabinet-work, and is in a good state of preservation. It has been lent by Mr. Talbot Bury.

* * *

It is understood that there is no probability of any opposition in the House of Lords to the Bill, which Sir Walter Foster has piloted through the House of Commons, for the purpose of removing a legal doubt which existed as to the powers of local authorities in small areas to borrow money for the erection of workmen's dwellings.

The town council of Cardiff have accepted the tender of Messrs. W. Symonds and Co., of Rectory-road, in that town, at £12,360, for the reconstruction of the public baths in Guildford-crescent, under the direction of Mr. W. Harpur, the borough engineer. The work provides for the taking down of the old building, re-erecting the building, and constructing new baths 60ft. in length by 22ft. in width, with manager's house, offices, and dressing-rooms. The accepted tender was the lowest of a dozen sent in.

The Abbey Manor house at Evesham, the residence of Mr. Edward C. Rudge, D.L., lord of the manor, was destroyed by fire on Sunday. The old mansion was a substantial building of stone, picturesquely situated on the site of the battle of Evesham, and commanding charming views of the river and the vale. Everything but the massive stone walls has been burned down to the ground. The moulded oak beams supporting the ceiling, and some beautiful carving in the library, fed the flames, which raged fiercely all the afternoon.

COMPETITIONS.

Llangefni.—The committee of the Welsh Calvinistic Chapel some four months back invited architects to send in plans in competition for a new chapel, and in response 13 sets of plans were delivered. Those sent in by Mr. R. G. Thomas, architect, Menai Bridge, have been selected, and he has received instructions to prepare the working drawings. The cost will be about £4,000. The style adopted is Italian.

* * *

CHIPS.

A new parish church has just been opened at Kilmuir, North Uist, N.B. Mr. Shairp, of Oban, was the architect, and Mr. Dugald MacTavish the contractor.

The masonry of the tower of St. Andrew's Church, Holborn, is undergoing thorough repair, and renewal where defective, under the direction of Mr. C. J. Shoppee, the surveyor to the Thavie trustees. Messrs. Dove Bros. are the contractors. The parapet, balustrade, and finials are now completed.

A new Primitive Methodist chapel at Burghclere was opened last week. It replaces a smaller one on the same site, and has been built by Mr. Head, of Burghclere.

The Baptist chapel at Barrowden was reopened last week after renovation, including the substitution of pitch-pine benches for closed pews, and the provision of a new floor. The builders were Mr. Dickens, of North Luffenham, and Mr. Coleman, of King's Cliffe.

The Scottish Board of Manufactures have reluctantly come to the conclusion that it will be necessary to discontinue the opening of the National Gallery at Edinburgh on Saturday evenings during the dark months of the year, in consequence of the very serious injury done to the pictures by the fumes from the gas.

Robert Browning's grave in Westminster Abbey is about to be marked by a comparatively large slab of Oriental porphyry, set in a frame of Siena marble. The inscription will consist of only the name and date of birth, with an English rose at the head and a Florentine lily below.

The first portion of the work of restoring the parish church of Bubwith, Yorks, has been commenced, to plans prepared by Mr. C. H. Fowler, architect, of Durham. Mr. T. S. Ullathorne is the contractor.

On Saturday the corner-stone of a new Baptist Sunday-school was laid at Ossett by Alderman Nicholson, of Wakefield. The building will be 61ft. long, by 31ft. in width, and the estimated cost is £500. Messrs. Land and Nettleton, of Ossett, are the contractors for the work.

A new Wesleyan chapel was opened on Friday at Great Kelk, in the Bridlington circuit. Mr. S. Dyer, of Bridlington Quay, was the architect, and Messrs. Bastiman and Gutherlass, of Kilham, the contractors.

At the last meeting of the Hove Commissioners, the salary of Mr. H. H. Scott, who has been surveyor for the past ten years, was increased from £400 to £500 a year.

The city council of Coventry received, on Tuesday, a report from a committee recommending that Mr. James Mansergh, M.Inst.C.E., be instructed to prepare detailed plans and estimates for a scheme for dealing with the sewage of the city on a site below Ryton Bridge and the Avon Valley.

A block of board schools, in three departments, is approaching completion at Brent, near Stone, North Kent, and another school for infants is being built on the hill for the same authority, the Stone school board. In both cases Mr. J. T. Watford, of Northfleet, is the architect, and Mr. L. Seager, of Sittingbourne, is the contractor.

Mr. Frederick M. Simpson, the recently appointed Professor of Architecture at Liverpool University, intends to carry out a vigorous administration at the School of Architecture and Applied Arts in that city. The board of management invite applications for the appointments of instructors in sculpture and modelling, decorative and figure painting, wood carving, wrought ironwork, and brass and copper work.

The town council of Neath, Glam., are about to carry out a new water reservoir. Mr. James Mansergh, C.E., is the consulting engineer, and the work will be undertaken under the direct supervision of the borough surveyor, who will be paid 4 per cent. commission on the contract.

At Stratford Police-court on Saturday, Henry Barker, building material dealer, of Skelton-lane, Leyton, was charged with removing and concealing large quantities of his goods within four months of his bankruptcy, with intent to defraud his creditors. Evidence having been adduced, the prisoner was remanded, bail being refused.

WAYSIDE NOTES.

ONCE a drinking-fountain always a drinking-fountain, and no repairs needed, seems the motto of some of our local authorities, who accept these memorials, and then appear to leave them to the mercy of the street urchins. There is, for instance, in Fleet-street, the drinking-fountain erected near St. Dunstan's Church by the late Sir James Duke. The water still flows into the stone basin to assuage the thirst of passers-by, but neither the barometer nor the thermometer is in first-class working order. Mercury no longer rises and falls in the thermometer-tube, while the rubbish stuffed through the apertures in the glass front has sadly interfered with the utility of the weather-recorder. In Paris it would certainly be someone's duty to look after little matters like these. In London, from the Shaftesbury-avenue affair of blighted genius down to the merest basin in a by-street, all are neglected, and most are, more or less, a disgrace to London.

English visitors to Antwerp will do well to accept with reserve a suggestion which will be made to them by a romancing verger, to the effect that two figures at the west end of the stalls represent the late Lord Beaconsfield and Mr. Gladstone. The tale has been related to so many that it is beginning to be believed; but it is pulverised this week in a statement which Mr. Harry Hems, the well-known Devonshire sculptor, has made in the *Belgian News*. Mr. Hems dismisses the whole as "simply a crafty verger's story," and adds: "I remember the stalls in question being cleverly carved by Deboeck or Vanwint about a quarter of a century ago. The figure on the extreme west of the north side is that of a shaven and tonsured monk, with a cope over his habit, and bearing an episcopal staff. He stands in an attitude of deep devotion, and has an ascetic, worn face. It is this they dub Lord Beaconsfield. Immediately opposite—*i.e.*, on the extreme west, on the south side—is a group. The shrine containing the Blessed Virgin and Holy Child receives the adoration of some passing wayfarers. The figures are on a sort of post, on which are hung the crutches and staves of those poor, afflicted folk who have received supposed benefit through their pilgrimage there. The Virgin's seat is supported by a bracket, and this latter takes the shape of a horned and bat-like winged head. This is declared to represent Mr. Gladstone." The more devoted admirers of the late Prime Minister will certainly consider the whole to be "a Tory plot" when it is added that the ordinary worshippers at the cathedral regard this figure as suggesting the Evil One.

The Hartlepool School Board are desirous of obtaining, by competition, designs and estimates for a two-storied upper standard school for 500 mixed pupils, to be built on a site known as Galley's field, facing "The Moor," at Hartlepool. They offer no premiums, and of course do not bind themselves to accept any plan. What is more, they furnish no levels and no particulars for the guidance of the competitors beyond the brief information afforded by their advertisement. There are to be 250 boys and 250 girls. The boys' department is to be supplied with laboratory and demonstration room, and the girls' school is to be furnished with cookery and laundry arrangements. An outline of the site is furnished, and inquirers for more information are told by circular that the advertisement contains all the particulars in the official keeping. The doubts thus engendered in the minds of some would-be competitors as to the bona fides of the affair do not, we must confess, seem entirely unreasonable; and although this may be the holiday season, enough energy ought to be forthcoming, even among the possibly worn-out, over-worked officials of the Hartlepool School Board, to enable that body of advanced educationalists to furnish mere precise instructions as to their intended schools, for which the equally over-worked ratepayers will have to supply the funds. If some architect is not already destined to have the job, or perhaps some select few practitioners with friends at court have not been furnished with more exact notions concerning the mind of the promoters, it is not easy to understand why such reservation should be observed. No professional referee is mentioned either, so that it requires but little imagination to picture the results of such a happy-go-lucky contest with every conceivable kind of plan sent in. The renewed energy of the Board after the holidays will doubtless be severely taxed in making a fair and advantageous choice of a plan under such conditions, and architects may well think twice before responding to the Board's invitation.

The summer exhibition at the York Corporation Galleries is a distinct success. With the collections in the Burton and Feversham Galleries, which are permanent features of interest in the exhibition building, upwards of a thousand works are on view. The hanging committee are to be congratulated on their taste, both in respect to hanging and selection, the whole show, taken collectively, being a representative one, comprising subjects ranging from Mr. Calderon's Academy picture of last year, "Elizabeth Woodville parting with her younger son, the Duke of York," to the tiny stippled pen drawings of Oxford by M. Claude de Neuville. Among other works by Royal Academicians is the "Flight into Egypt," by Mr. F. Goodall, while Mr. Solomon's "Dinner-party," the charming landscapes by Mr. David Murray, and the architectural drawings by Messrs. Demaine and Brierley should prove attractive exhibits.

I had hoped that with your publication of Mr. J. M. Brydon's selected design for the Pump-Room Extension at Bath, and of Major Davis's design "O," which was favoured by so many Bath chaps—I beg pardon, I intended to say citizens—that I had heard the last of this wrangle. According to the *Western Daily Press*, however, there is every prospect of a lively time at the Bath Guildhall to-day (Friday), when a Local Government Board inspector will hold an inquiry into the application of the town council for power to borrow £30,000, the cost of the Pump Room extension. As that journal remarks, "No subject in local annals for many a year has been the cause of such personal acrimony and heated debate in the proceedings of the corporation as this proposal, and it is said that the question will be fought to the bitter end, and that before the inspector there will be resolute opposition to the plans recommended for adoption; but as the main consideration will be the likelihood of the success of the extension from a financial point of view, it is not contemplated that the design for the building will weigh much with the representative of the authorities at Whitehall, if there is shown a good prospect of the venture not resulting in a burden on the rates." The inhabitants of Bath are anxiously waiting for a commencement of actual operations on the site in the Abbey churchyard, which for long has been a desolate waste, but there seems little probability of a start being effected before the next Bath season begins.

By the demolition of some old houses in Catherine-street, Strand, and in Drury-lane, the old churchyard which Charles Dickens described in "Bleak House," and which is approached by a narrow passage leading from Russell-court, has been brought to view. The churchyard on the left-hand side of Drury-lane, higher up, has frequently been talked of as "Joe's Churchyard," but the miserable burial-ground which received the remains of poor "Nemo" is that on which the sunlight is now allowed to shine through the clearing-away of the rookeries which previously hemmed it in on east and west. At the end of the Russell-court passage the gate with its iron bars, through which Joe pointed out to Lady Dedlock the grave of his benefactor, still hangs on its rusty hinges, although the graveyard itself has been asphalted over and turned into a playground. Some thousands of Dickens's admirers, including a large number of Americans, have visited the spot during the past few weeks.

The annual excursion of the Sussex Archæological Society was held on Thursday in last week, when, under the leadership of Mr. R. Garraway Rice, F.S.A., the members visited the church, Park House, and North Chapel (the latter a 17th-century half-timbered house) at Horsham, Shipley Church, Knepp Castle, and West Grinstead Church.

Messrs. Fambrini and Daniels, Architectural Concrete Works, Lincoln, are supplying their red concrete masonry in heads, sills, mullions, and bonded jambs, &c., for several blocks of cottages in Bedford-road, Guildford. The block now in hand is being built by Messrs. Swayne and Son, contractors, Guildford. The architects are Messrs. Peak and Lunn, also of that town.

OBITUARY.

Mr. Joseth Boult, a well-known Liverpool architect and surveyor, died at his residence, 6, Kelvin-grove, Prince's Park, on Thursday, the 9th inst., in the 77th year of his age. For many years Mr. Boult enjoyed a high reputation in local circles as an architect and art connoisseur, and was a prominent member of the Liverpool Architectural Society. He was surveyor to the Liverpool Exchange Company, and upon his resignation of that office, twelve months ago, the company, to mark their appreciation of his long connection, retained him as consulting surveyor. Mr. Boult, who was a bachelor, had been in failing health for some months past, but continued to transact business up to a very recent period.

Mr. Thomas Sturdy, a young architect of much promise, at Middlesbrough, died on Friday, after a short and severe attack of inflammation of the lungs. His father, an architect and surveyor in Middlesbrough for about 30 years, died from pneumonia a year ago.

CHIPS.

The Kingsbury School Board have recently instructed Messrs T. W. F. Newton and Cheatle, 121, Colmore-row, Birmingham, to prepare plans for remodelling and enlarging their Hurley Schools. This will be practically rebuilding, as a portion of the old school has recently been condemned by the Education Department. The new accommodation will provide for 250 scholars. The design is a free rendering of the Georgian style, and will be carried out in local bricks and tiles.

On Saturday, the town clerk of Leeds received notice from the Leeds Tramways Company of the discontinuance of their action to recover £61,000, being the difference between the value of the tramways on the basis of structural value and of rental value. The abandonment of the action follows on the recent judgment in the House of Lords.

Good progress is being made with the new municipal buildings for Oxford. Mr. H. T. Hare, whose design was selected in competition last year, is the architect, and Messrs. Parnell and Sons, of Rugby, are the builders.

New National schools are now in course of erection at Newcastle, Staffs, from the designs of Messrs. Chapman and Snape, architects, of that town. Special consideration has been given to the ventilation, which will be carried out on the Boyle system, the latest patented improved form of self-acting air-pump ventilators being adopted for the extraction of the vitiated air, and their improved air-inlets for the admission of fresh air.

The foundation-stones of a Wesleyan chapel were laid at Skellingthorpe on Monday week. It will be a Gothic structure of red brick, with white brick and Ancaster stone dressings. It will consist of a chapel 50ft. by 27ft., separated by a movable partition from a school 30ft. by 20ft., and a vestry 13ft. by 11ft. The chapel will have an open timber roof, and the seats will be of pitch-pine. The cost will be about £750. The architect is Mr. J. T. Drury, Lincoln, and the contract is let to Mr. J. W. Harrison, builder, Lincoln.

A Celtic cross in granite, executed by Messrs. S. M'Glasher and Sou, Edinburgh, has been erected by subscription in Warriston Cemetery, as a memorial to the late Thomas Henderson, of Edinburgh.

The Bishop of Winchester, on Saturday, laid the foundation-stone of the new church of St. Mary, Worcester-park, Cuddington. This will be the first church erected in the parish of Cuddington since the ancient church was destroyed by Henry VIII. about 1540.

The Aberdeen Harbour Board considered on Monday the report presented by Mr. Henry H. Wake, C.E., as to the improvement of Regent Bridge, the widening of the quays, and the provision of additional shed accommodation. The construction was recommended by the engineer of a steel swing bridge, which, with machinery, quays, and approaches, was estimated to cost £13,411. The cost of widening Trinity Quay, Regent Quay, and Victoria Quay, and erecting sheds was estimated at £32,580. A committee recommended that the Commissioners should authorise the construction of a steel swing bridge, and the widening of Regent Quay eastward of the bridge, and the construction of two sheds on the quay when widened alongside Victoria Dock. After a long discussion a decision on the subjects was postponed for a month.

The Turkish Department of Public Works has ordered the immediate repair of the old aqueducts of Solomon in Jerusalem. These aqueducts will bring the water to the city from the fountains of Arroul. A tunnel is to be built 3,750 mètres long, and is to cost £80,000. The aqueduct was still in working order in the time of Christ.

Engineering Notes.

Cardiff.—The work of rearranging and extending the lines and station platforms in connection with the Great Western Railway at Cardiff is now in progress, but will not be finished in less than 18 months. The principal alteration will be the construction of an island platform for the down line traffic, while another platform nearer the Penarth-road will be built for the Taff Vale Railway traffic. Mr. Strachan, of Cardiff, is now engaged in putting in the foundations for the new structures, and the contract for the new station, tenders for which have already been sent in, will be let shortly. A double line of rails will be carried from the Penarth curve to the curve leading to the Queen-street station. This will involve the construction of a new bridge alongside the existing one in Bute-road, but at a greater elevation than that structure, and further bridges over the Penarth-road and the Glamorganshire Canal, besides the formation of fresh embankments between those points. Further provision will be made at the same time for the Barry Railway passenger traffic, and a new station will be built at Clarence-road, Bute Docks, to replace the present temporary structure. The total cost of the works projected will exceed £100,000, of which about £40,000 will be spent in foundations and buildings. The scheme has been prepared by Mr. J. C. Inglis, engineer-in-chief to the Great Western Railway Company, Paddington, and the resident engineer is Mr. W. A. Cashman, while Mr. Roberts, Newport, is the divisional engineer.

Standeyge Hills Tunnel.—The new double-line railway tunnel made through the Standeyge Hills in the Pennine Chain, between Marsden and Diggle, by the London and North-Western Railway Company, and the works connected therewith at each of those places, have been inspected by Major Yorke, Government Inspector of Railways, and were opened last week. The old pair of single-line tunnels will now be closed for three months for repairs, and then all four lines will be constantly used. It was four years ago—namely, on the 5th of August, 1890—that the first sod of the new tunnel was cut. The tunnel is three miles and 70 yards long. The maximum number of men employed on the works has been 1,800. The work of boring the tunnel was of an arduous character, the geological formation being millstone grit and Yoredale shale, with coal in a few seams too thin almost throughout to be worth separating, and 120 tons of gelignite were used in blasting operations. The millstone grit removed was crushed and used for ballast for the permanent way. The walling of the tunnel is throughout of bricks, those next the soil being made in neighbouring places, but the facing is of brindled bricks from Staffordshire. No fewer than 25,000,000 bricks were used. The tunnel has been constructed from the plans and under the direction of Mr. F. Stevenson, chief engineer to the company.

The Inverness and Aviemore Line.—At a meeting of the directors of the Highland Railway at Inverness, on Friday, the offer of Messrs. Charles Brand and Son, Glasgow, was accepted for the construction of the last section of the new direct line to Aviemore, extending from the ticket platform at Inverness to Culdoich, in Strathnairn, a distance of over seven miles. The contract price is £104,900. Under the original contract, recently renounced by Messrs. Mackay and Mackay, the price was £118,000. A considerable portion of the work has, however, been executed, a sum of over £31,000 having been expended. The works still remaining to be executed consist of the completion of the stone viaduct over the River Findhorn, over 575yds. long, and rising to a height of from 58ft. to 129ft.; the completion and construction of over thirty bridges and culverts; and excavations, &c., to the extent of over 440,000yds. The directors are anxious to have the line completed at the earliest possible date, and with this object Messrs. Brand and Son, who constructed the Sutherland Railway, and some sections of the Highland Railway, are expected to put on a large number of men on the works, and push them forward with all expedition.

The New West India Dock.—This vast shipping basin, which for many years has practically been lying idle, its depth and entrance capacity being quite insufficient for modern requirements, was reopened yesterday (Thursday), after extensive improvements carried out at a cost of £200,000. Mr. H. F. Donaldson, M.Inst.C.E., was the engineer, and Mr. Robert Carr, the consulting engineer. The improvement consists of a new entrance lock opening from the river into the Blackwall basin, together with two new open cuts passing between concrete walls from that basin into the import and export docks respectively. The entrance lock, which is 60ft. wide, is 480ft. in length, and has a uniform depth of 30ft. over the sills. The dock gates will be opened and closed by direct-acting rams. The bulk of the work has been intrusted to Messrs. Lucas and Aird, in whose contract everything has been included except the gates, the machinery necessary for pumping and hydraulic purposes, and the lengthening of the railway bridges over the two cuts. Messrs. Armstrong and Co., Limited, of Elswick, have supplied the whole of the hydraulic machinery; the pumping machinery has come from the works of Messrs. Easton and Anderson, of Erith; and the bridges on the railway of the Joint Committee have been lengthened from 45ft. to 60ft. by Messrs. W. Arroll and Co., of London and Glasgow, without any interruption of the traffic. In conjunction with the new entrance, a quay extension, 20ft. wide, providing six berths, has been made on the north side of the import dock. This work was intrusted to Mr. John Price, of Westminster, and cranes are being supplied thereon by Messrs. Tennant, Walker, and Co., of Leeds. A considerable sum has recently been spent in the neighbourhood of the Blackwall basin and the Junction Dock in meeting the requirements of the hardwood trade. Overhead travellers worked by electricity have there been erected for manipulating timber in large logs. The London County Council are rebuilding the Isle of Dogs bridges, and the means of public access to the dock will thus be much improved.

The Wrexham and Ellesmere Railway.—This railway will be opened in January next. At present there is a gap of 1¼ mile between the Wrexham section of the work and the Ellesmere section; but Messrs. Davies Brothers, the contractors, expect to get a temporary line through within the next six weeks. At Lightwood Green, about nine miles from Wrexham, the line has to be carried over the Liverpool pipe line from the Vyrnwy Lake, and here treacherous ground was met with, necessitating extensive piling in order to obtain a satisfactory foundation for the bridge. The bridge to carry the line over the River Dee is expected to be finished in about six weeks, and the whole of the other bridges, with the exception of one road bridge and four accommodation bridges, are either completed or well in hand.

CHIPS.

A large choir vestry is being added to St. Bartholomew's Church, Armley. The design is by Messrs. Walker and Athron, of 18, Park-lane, Leeds, the architects of the church, and the builder is Mr. Wilson, of Headingley.

Mr. D. W. Stevenson, R.S.A., has been commissioned to execute a bust in marble of Bailie Mearns, to be placed in the Art Gallery, Aberdeen. The bust forms part of a presentation recently made to Bailie Mearns by his fellow-citizens.

A Freeman memorial mission room is about to be built at Brookport, Southowram, from plans by Messrs. Jackson and Fox, of Halifax.

The Northern Co-operative Company are about to erect new shop and stores at the corner of Rosemount-place and Short Loanings, Aberdeen. The contracts for the erection of the buildings were accepted on Friday, the total outlay amounting to £7,352.

"Andromeda," by William Etty, R A., has been presented to the Corporation Art Gallery at Manchester, and is the seventh work by that great colourist of the last generation in the collection.

A Bill for the Licensing and Registration of Surveyors is again this session under consideration by the Parliament of Victoria. It is drafted on the lines of the Bill rejected last session by the South Australian Legislature.

At the Church Congress, which will be held this year at Exeter, assembling on October 9th, Professor W. B. Richmond, A.R.A., will read a paper on "Church Architecture and Decoration."

A large clock was formally started at Long Clawson Church, near Melton Mowbray, on Aug. 9. It shows time on two large dials, chimes the Cambridge quarters, and strikes the hours. It has been carried out generally to the designs of Lord Grimthorpe by Messrs. John Smith and Sons, Midland Clock Works, Derby.

Correspondence.

ROCHDALE TECHNICAL SCHOOL AND LIBRARY.

To the Editor of the Building News.

Sir,—During the last few days I have received a number of applications from architects in different parts of the country, who, having seen a paragraph in your paper stating that the Rochdale corporation are about to erect a technical school and library, are desirous of submitting designs therefor.

As we have both a technical school and library already in existence in this borough, I shall feel obliged if you will cause some explanation to be published in your paper, and thus prevent further confusion.—I am, &c.,

Zach. Mellor, Town Clerk.

Town Clerk's Office, Rochdale, Aug. 10.

[The mistake is apparently in the name of the town. It is certainly not Rochdale.—Ed. "B. N."]

ARCHITECTURAL EXCURSION ILLUSTRATIONS.

Sir,—Upon examining the illustrations, and perusing the reading, *to the best of my recollection*, what is now called Stourhead was 35 years ago (when I was in Wiltshire for some months) called Stourton Hall, and originally belonged to Lord Stourton, the bankers or brewers (Hoare) gaining possession by purchase, or otherwise, of the property.

During my residence, or just before, in Mere, during some alterations to Stourton Hall, a wall in the basement sounded hollow, when a hole was knocked through, and the explorers found a small vault, or crypt, containing a coffin, an urn, a chair and table, together with many other relics. This vault was believed to be the burial place of one of the Lord Stourtons, who was hanged at Salisbury for murder, the silken halter being still, I believe, in Salisbury Cathedral.

The county of Wiltshire is full of interest to archæologists. At Mere you will find what is called Castle Hill. During some excavations the foundations of a large castle were found there, no account of which has ever been published. In the outskirts of Mere there is, or was, a building used as a barn which contained a very handsome carved stone chimneypiece. The oak rood screen in Mere Church is very fine. The old hostelries contain some interesting relics.

I have no doubt some of your contributors could afford your readers some interesting architectural and legendary news of Mere and other old "stage-coach" towns that are now almost deserted.

Apologising for trespassing on your valuable time,—I am, &c., Geo. T. Howell.

TOMBSTONES.

Sir,—Can anything be done, through the architectural or art journals, to improve taste in the designing of tombstones? Our cemeteries, though often laid out with some attention to beauty in the arrangement of walks, flower-beds, and shrub plantations, are rendered unsightly by the multiplication of objects of the monumental mason's want of taste. Of course, the public have the remedy—viz., to apply to a good architect for a design to be carried out by a mason. But few do so, and most think themselves competent to choose from the various specimens in the monumental mason's yard, as they choose a funeral card, or mourning at the milliner's.

One or two Celtic crosses I have seen, at rare intervals, which were just delightful to look at. I am sure there are many who would be pleased to see a journal like the Building News taking this matter up.—I am, &c. E. E. Minton.

Spring Bank, Bury, Aug. 13.

THE LATE EDWARD CLARK.

Sir,—We beg to say that the late Mr. Edward Clark was neither the author of the designs for the cemetery chapel and lodge at Ripon, nor the Ilford Local Board Offices, as you stated in a recent issue of the Building News when referring to the sudden death of our Mr. Clark's father, the late Mr. Edward Clark.

We were the authors of both of these successful designs in open competition, and no doubt the error arose through our having had the same address formerly; but we have recently moved to 28, John-street, Bedford-row, and are now also carrying on our Mr. Clark's late father's practice at 47, Strand.

We may mention that the late Mr. Edward Clark was for more than thirty years Quantity Surveyor to the Trinity House, and took out the quantities for all the lighthouses and other buildings erected by the Trinity House during that period, the more important works being Eddystone, Bull Point, Heligoland, Caldy, Portland, Anvill Point, Bardsey, Lowestoft, Spurn Head, Withernsea, and Gibraltar lighthouses.

He carried out the rebuilding of, and alterations to, many of the theatres and music-halls in London, among others being the Foresters, the Royal, the South London Palace, the Olympic, the Sun, the Raglan, Covent Garden Theatre, Britannia Theatre, the Alhambra, the Cambridge, the Trocadero, the Metropolitan, the Standard, and the Bedford. He also rebuilt the Teatro Principal, Lima, South America; Woolwich Theatre, and the Hall by the Sea, Margate. He was hon. architect to St. John's Hospital for Diseases of the Skin, Leicester-square, and to the Royal Society for the Prevention of Cruelty to Animals. He designed the Surrey Masonic Hall at Camberwell, and reconstructed the New Club, Covent-garden, and also many hotels and other works in London and the provinces.—We are, &c.,

Clark and Hutchinson.

47, Strand, W.C., Aug. 9.

VENTILATION OF SEWERS.

Sir,—May I be permitted to explain the apparent discrepancy in my report on sewer ventilation, to which "Sanitary Surveyor" calls attention in your issue of August 10? Your correspondent states rightly that I condemn the creation of draughts throughout the length of the sewers by means of inlets and outlets at different elevations, and yet I advise my sanitary authority to apply to the Local Government Board for powers to frame a by-law enabling them to erect small shafts at every house. A reference, however, to my report will show that my intention is that the sanitary authority shall then be in a position to erect these "safety-valve" shafts in such positions as they may deem advisable—for instance, at the head of each branch sewer, with perhaps an occasional one in the length of any unusually long run of sewer; but it is far from my wish that every house should actually possess one of these shafts. I quite agree that, where possible, all such shafts should be attached to trees and to public buildings, rather than to dwelling-houses; but unless the sanitary authority have the power to erect a shaft at any and every house within their jurisdiction, they must at times be unable to choose the best points at which to relieve pressure.

In reply to Mr. Ford, I would say that, in my opinion, the investigations of Mr. Parry Laws prove nothing. Had he examined, say, 1,000 samples of sewer air as it emanates from a shaft or surface grating in a neighbourhood where typhoid fever or diphtheria is prevalent, I would have been more than content if he had met with the germs of these diseases in half a dozen of the specimens; but to say that because no pathogenic organisms were found in some two or three samples of sewer-air, taken at a time probably when no zymotic disease was prevalent in that immediate neighbourhood, therefore, these germs do not ever exist in sewer-air, and to set such evidence against the overwhelming experience of the medical profession as to the connection between sewer emanations and outbreaks of diphtheria or of typhoid fever, is, to my mind, not merely unscientific, but absurd, and I fear it will help us but little towards the solution of this most serious problem to theorise about "alkaloidal substances present in minute quantities" in sewer-air, the very existence of which has not yet been demonstrated. The facts of the case are so plain that theories such as these can only tend to obscure the main issue. We have to deal with certain diseases, notably typoid fever and diphtheria, which we know are each due to a specific organism, and we may take it that these organisms do not originate *de novo*, nor can they be "developed" out of the ordinary putrefaction or other bacteria. We know that these organisms are found in large numbers in the discharges from the patients, and we also know that such discharges are frequently poured into the drains and sewers without previous disinfection. We know, again, that these organisms can live and thrive in sewage for several months, and we have the experience of many outbreaks of disease to prove that emanations from sewers will at such times communicate the disease. The only link, therefore, that can be said to be weak is the actual demonstration of these organisms in the sewer-air, and I contend that this deficiency is the result of an insufficient number of investigations, and partly also because inopportune times have been chosen for the collection of the samples, for I should be sorry indeed to suppose that the presence of pathogenic organisms in sewer-air is at all a frequent occurrence in healthy districts. Perhaps Mr. Ford is unaware of the fact that Dr. Fisher, of New York, has recently demonstrated the presence of diphtheria organisms in sewer-air in that city during an outbreak of that disease, and we therefore have this positive evidence to put against the negative evidence of Mr. Parry Laws. Moreover, once this point is conclusively proved and accepted, there will, I imagine, be very little difference of opinion as to the inadvisability of admitting sewer emanations into our already much defiled atmosphere.

Further, Mr. Ford considers that because it is found that sewer-air contains an excess of "carbonic acid" (CO_2), therefore it is essential to purify this sewer-air—for what purposes I know not—by forcing pure air at various points into the sewer and receiving in exchange fouled air at the outputs. Let us be content to leave the sewer-air in the sewers, where it will harm no one, save, perhaps, the rats; but lest the sudden accession of storm water may force a weak trap, we will provide, at distant intervals, safety-valve shafts of small calibre, which will suffice at once to relieve any pressure that may tend to form on such occasions. Where the dual system is in force, and the storm water does not gain access to the sewers, I consider that no ventilation whatever of the sewer is either necessary or advisable, and the past experience of Bristol, where the sewers, although tide-locked for several hours daily, are yet absolutely unventilated, proves, I think, that my contention is sound.—I am, &c.,

Francis W. Clark, M.B., D.P.H., M.O.H.

Lowestoft, Aug. 13.

Sir,—Referring to Mr. Ford's letter in the Building News of 10th inst., would it not be an advantage to have in all sewers, instead of the disinfectants introduced at some cost by sanitary authorities, "more of that highly poisonous chemical substance, possibly of an alkaloidal nature," so vaguely hinted at in Mr. Ford's quotation? It would be just the thing to prevent the multiplication of pathogenic organisms, instead of introducing these organisms into fresh air, as our good sanitary Samaritans appear to do for the purpose of enabling them to multiply *ad libitum*.

Much of the erroneous practice of medical officers and surveyors is due to their limited aquaintance with the biology of the subject.

If we go back to the period before 1875, the date of the Public Health Act, we find, on comparing it with the present time, a considerable diminution now of deaths from enteric fever, which has been claimed by sanitary engineers as due to the works they have devised for the removal of sewage, forgetting how much is due to better medical treatment, better nursing, and more cleanliness in the habits and houses of the people. When these are taken into account, I am afraid there will not be much left for the sanitary engineer to boast of.

At the annual meeting of the British Medical Association held at Bournemouth a year or two ago, Dr. J. Lauder Brunton, in his address, stated "that some diseases have been more frequent, and others rarer. Thus typhoid is almost certaily more common, because the increase of our sewage system has given greater facilities for its spread."

Sir Charles Cameron, a few days ago in his address to the British Medical Association at Bristol, states: "The general improvement in the sanitary condition of all our great towns has reduced the zymotic death-rate to nearly one-half of what it was at no distant date. But in some towns typhoid fever has not declined, and in a few it has increased." Further on he says: "I have no doubt that localised epidemics of this disease are frequently caused by infected water and milk, but I believe that the greater number of cases arises from the *Materies morbi* of the disease being absorbed from the air." He also refers to Bristol, in which typhoid cases are comparatively few, as the only large town in which the sewers remain unventilated.

If we take Leicester, an exceptionally clean town with well-ventilated sewers, we have Dr. Priestly, the able officer of health, stating in his report of last May that "the number of typhoid cases at Leicester notified during 1893 is almost double what it has ever been before since the Local Notification Act came into force. The deaths, too, are more than in any previous year during the same period—viz., 1879 to 1893, although there had been a gradual decrease since 1853, which went on *pari passu* with improved sanitation. Careful investigation has failed to connect any of the cases with a polluted milk-supply, and in only a very few instances has contaminated well-water been used at infected houses. The town water supply was proved by analysis up to its usual quality."

Unfortunately, I can add something from my own recent experience, in the case of a young lady relative who was with me about three weeks ago in High Holborn, London. In crossing the street we passed over a foul-smelling sewer grating. My relative had that morning heard some news that depressed her very much, though it afterwards proved unfounded. She is now lying ill in the country with typhoid fever.

Eight years ago the smell from a foul sewer grating in the Strand, perceived after coming out of a theatre in which an affecting piece had been played, caused the death of my daughter from typhoid. Every effort was made, with the assistance of the sanitary inspector, to see if any other cause could be assigned for her catching the fever, but none could be found other than road sewer ventilators.

The subject is much too long and technical to exhaust in a correspondence of this kind. I can only add that my experience leads me to the conclusion that to send the evaporation from nearly 100 million gallons of sewage daily into the atmosphere of London, and similarly in other towns, is criminal, and should be prohibited by Act of Parliament.—I am, &c., J. T. Hurst.

ASSISTANT SURVEYORS, WAR OFFICE.

Sir, — Owing to unavoidable circumstances I was unable to reply to "Balbus" last week, but certain statements of his require correction; and, as the issues raised by the subject are of greater importance to architects than at first sight would appear, I trust that you will insert my letter in this, the leading journal of our profession. I will, however, refrain from tormenting your readers with any grievances of public servants, which are but the outcome of one of the most singular systems ever invented by the ingenuity of man.

How does he make out that "an ornamental head to the department is a necessity"? Have the English or Irish Offices of Works ornamental heads? When the Royal Engineers attempted to enter the former in 1870, the First Commissioner of Works replied "that the only persons who are properly qualified for the performance of the duties connected with the Office of Works (also applicable to the Army Works Department) are those who have been regularly educated in the business of architects and surveyors, and that the profession of an engineer is entirely different from that of an architect." Further, "in the case of officers of Engineers, if they performed their duty in an unsatisfactory manner they would retain their military position intact, and it would be quite impossible to make any arrangements consistently with economy to relieve them of their employment under this office." The Irish Office of Works also checked a similar effort at intrusion. The R. E.'s controlled the Admiralty Works Department since 1834, but "because it was found their presence was not only useless, but a hindrance, disadvantageous to public service and to themselves, they were withdrawn in 1849." There is not only one ornamental head in an R.E. sub-district, but half a dozen, for the commanding Royal Engineer and his division officers are excrescences, who paralyse the work with correspondence, and with their extraordinary notions of technical affairs, and who, when their labourers resent interference, quash all matters with a decisive military despotism.

The allusion of "Balbus" to Tom Pinches in the civil world is not happy. Architects and civil engineers, after serving a pupilage of from three to five years, become assistants to large practitioners for lengthy periods before presuming to commence practice on their own account; but their employer has held the same position before them, and is quite capable of performing all the duties of his helpers. This is not so with Royal Engineers. They are *not* qualified architects and civil engineers, but an indolent public give them the benefit of the doubt for buildings which they do not, and are not possibly able to, satisfactorily design. Hence the *necessity for Registration*, for then such credit would not be misplaced, and architects would receive their due. R.E. officers, when they come face to face with architectural work, evade the difficulty by getting *civilians* to do it for them, at the same time appropriating the honour to themselves. Were the Architects' Registration Bill to become law, pretence of such qualifications would be illegal, and prohibited. The truth is, the whole establishment has been arranged for the express exaltation of the Royal Engineers, while architects and others concealed therein go to the wall.

So much for the civil side. What about the military view? Why should Royal Engineers be in the Army Works Department at all? And what good does it do them, beyond the fine salaries they draw, varying from £200 to £1,200 per annum? The so-styled "Royal Engineer Establishment" was originally civil under the Board of Ordnance, into which military engineers obtained entrance after the battle of Waterloo, on the supposition that such employment in times of peace would increase their efficiency for war. The technical work of the department, however, from that time down to this, has been executed by civilians, under such titles as surveyors, draughtsman, clerks and foremen of works, though since 1862 military clerks and foremen of works have been introduced, whose rank is only departmental. Meanwhile the regiment is fully officered, so that the Royal Engineers occupied on barrack construction are in reality *superfluous officers*. There are 938 R.E. officers to 6,638 N.C. officers and men, or, in other words, one officer to every seven men! What a contrast to Germany, with its one engineer officer to every 23 men! In no other country are military engineers permitted to rest in practically civil offices outside their proper sphere of duties; and, not only Germany, but France, Austria-Hungary, and other States have purged their barrack departments of the obstruction, and created distinct establishments for the designing and erection of army buildings, leaving fortifications to engineers only. Lord Wolseley, before the Commission on Civil Establishments in 1887, expressed his disapproval of the present system, and many other eminent men of war hold the same opinion. As for the reiterated statement that soldiers are better qualified for planning military edifices than civilians, this idea is quite upset by the undeniable assertion that there is not a barrack in the kingdom that has not been actually designed by a civilian, the necessary explanation being afforded by the simple fact that Royal Engineers are not qualified architects. And Mr. Freeman-Mitford, M.P., during the discussion on the Army Estimates in Parliament on 6th July last, said that "when they called on a Royal Engineer to become an architect, they asked him to do something which was outside his own profession," and that "the Engineers should be left to the performance of their proper military functions," while even Mr. Campbell-Bannerman, M.P., declared that "he was accustomed occasionally to have his little kick at the Royal Engineers."

The same cry comes from India, where a committee is at present sitting for the reorganisation of the Military Works Department in that country, which an Indian technical paper characterises as a "most useless and expensive department, mainly organised to shelter Royal Engineers." And the *Broad Arrow* of the 11th inst. states:—"In regard to the excessive expenditure occasioned in the Indian Military Works Department, the Lieutenant-Governor of Bengal has recommended a return to the old system of intrusting the execution of all military works to the civil department. If his recommendation is followed, the Government of India will be in a position to dispense with the services of a large number of Royal Engineer officers." If this applies to India, with its pioneering work, why not at home, where the same evils, manifold multiplied, exist? Then, and not till then, will our profession cease to be degraded, and a Government body of architectural servants receive justice. Such change would benefit the State, and prevent justifiable growls to your estimable journal.

Finally, I venture to advise "Balbus" to continue "building the wall" of his early Latin grammar days; but let it be with modern materials, and on a foundation of firmer arguments.—I am, &c., One Who Is In It.

Intercommunication.

QUESTIONS.

[11197.]—**Water in Cellar.**—Would one of your readers inform me the best way to keep the water out of my cellar, which is situated as follows? Excavated in sand to the gravel, which is about level with the river six hundred yards distant; the walls of house are of cement concrete, gauged 3 and 1, to about 3ft. above floor-line, and the cellar floors are of similar cement concrete, finished smooth in nearly neat cement. After heavy rains, the water in the river rises, and in a very short time I find from two to six inches of water in my cellar. If any kind reader will inform me of any way of preventing this, I should esteem it a favour.—E. Miles.

[11198.]—**Nene Valley Churches.**—Will some reader kindly give a list of the Nene Valley Churches, &c., to study Early English work, and how to visit same for holidays, for R.I.B.A. exam.? Ought student to know all the Greek temples, whether in existence or passed away? Any other information would greatly oblige.—Student.

[11199.]—**Reservoirs and Dams.**—Has warm or hot water any effect upon the embankments or puddling beyond cold water? If so, what are the best precautions to be taken to prevent leakage or deterioration of work?—Doubtful.

[11200.]—**Hollow Walls.**—I have always been given to understand that hollow walls are preferable to solid ones, both as regards warmth and sound; but I have built some houses, the division walls of which are built with a 1in. cavity, without bond, and a 4½in. brick on each side of same, instead of being solid in the usual way, and the proprietor complains of the transmission of sound from one house to another. The following excerpt has been taken from the Building News of November 5th, 1880, p. 522:—"As sound passes most quickly through homogeneous substances, a hollow space or wall with a cavity in it is much more sound-proof than one of solid material of the same density." I should be glad of expressions of opinions on this matter.—Perplexed.

REPLIES.

[11191.]—**Architectural Tourist.**—Hampshire contains many places of archæological resort besides Winchester, which is replete with architectural interest. The cathedral, of every style from Norman to Perpendicular, the college and castle, and numerous churches will afford "Tourist" a few days' work. St. Cross, East Meon, Porchester Castle, Soberton, Droxford, Basingstoke, Romsey, Netley, Christchurch, Beaulieu, are other places where important ecclesiastical buildings and ruins are to be found. Winchester, Bishopstoke, and Southampton are good centres for working from. The Isle of Wight is not a very attractive field for the architect or ecclesiologist, and with the exception of Carisbrook, Newport, and Yarmouth, few remains are to be seen.—G. H. G.

[11193.]—**Chancel Screens.**—One recently-built church (All Saints', Dulwich) has a very handsome stone screen which fills up the chancel arch. The head is traceried of a Geometrical type, and the architect is Mr. G. H. Fellowes-Prynne, who has also erected a similar screen in his new church of St. Peter's, Staines. This form of constructional rood-screen has undoubted beauty, and lends a charm to the sanctuary and choir. These two instances are unique.—G. H. G.

[11193.]—**Chancel Screens.**—At Staines, a score of miles from London, "Inquirer" may see Mr. Geo. H. Fellowes-Prynne's latest new church, dedicated so recently as last month. In this particularly handsome building, the chancel screen is carried right up to the full height of the chancel arch. Four lofty and slight columns rise from a dwarf screen, and the ornamental parts are kept above the springing of the arch itself. Thus the screen in no wise blocks the triplet of chancel windows at the east end; all is in stone.—Harry Hems.

[11194.]—**Testing Drains.**—"House," in his question, does not state whether the local sanitary authority has served any demand or notice upon him, and, if so, under what Act and what section? The Public Health (London) Act, 1891, imposes a duty on "every sanitary authority to cause to be made from time to time inspection of their district, with a view to ascertain what nuisances exist calling for abatement under the powers of this Act, and to enforce the provisions of this Act for the purpose of abating the same." Section 2 defines under nuisances (general): "Any . . . drain in such a state as to be a nuisance, or injurious or dangerous to health." Under section 10: "The sanitary authority shall have a right to enter from time to time any premises for the purpose of examining as to the existence thereon of any nuisance." The local sanitary authorities are given power under section 16 to make by-laws for certain specific purposes; but there is no mention of drain under this section. It will, therefore, be seen that under the above Public Health Act (as well as under the Local Management Act, 18 and 19 Vic. cap. 120), the sanitary authorities have power to inspect drains. Whether, however, "inspection" would entitle the authority to test a drain by, for instance, what is known as the "water test" is a very debatable point. It might fairly be contended that if a drain fulfils its ordinary requirements or function by the efficient transmission to the public sewer of such matter and liquid as are ordinarily discharged into it, it is all that any sanitary authority could demand, and that if no nuisance arises therefrom, the requirements that every drain shall be perfectly watertight when completely filled throughout its whole length (a condition which does not arise in the ordinary use of a drain) is one that cannot be enforced, and is not contemplated by, and certainly not expressed in, the Act above quoted. Although certain sanitary authorities may have made by-laws of their own, requiring such, it is questionable whether such by-laws are not *ultra vires*. The fact which "House" states, that "there appears to be a difference of practice in London (I assume he means among the different sanitary authorities) goes to show that many of the assumed powers are, to say the least, very questionable. Owners frequently carry out the request of local sanitary authorities rather than have any altercation or conflict with such a body, but this does not legalise their demand. Should "House" contest the power of the local authority, I should be pleased to hear of his success.—W. Herbert Daw.

[11196.]—**Joints for Stoneware Pipes.**—Stanford's jointed pipes have a good reputation, and are largely used. Other inventors have introduced improved joints for stoneware pipes, and I may mention particularly Doulton's self-adjusting joints, which require no cement or skilled labour, and allow of any settlement. See also article on "Tests of Cement Sewer Joints" in last week's issue.—G. H. G.

CHIPS.

At Predmost, in the province of Moravia, Herr Mascha, a local *savant*, has within the past few days found, side by side with mammoth bones, the entire skeletons of a family of six human beings.

The town council of Ipswich at their last meeting decided to purchase fifty acres of the central portion of Christchurch Park for £16,000, to be maintained as an open space. The property, which adjoins the town, recently came into the market, and a year since the ratepayers refused to ratify a bargain made by the council to buy the entire property of 75 acres, with the Elizabethan mansion thereon, for £42,000, deeming the price too high. The outer fringe is being cut up and sold as building plots.

In the case of Samuel Tozer and Ernest Tozer, of Torquay, builders, the discharge from bankruptcy has been suspended for two years, ending July 12, 1896.

The new reredos at Manchester Cathedral, erected from designs by Mr. Basil Champneys, architects to the Dean and Chapter, has been unveiled. It is constructed of cedar, decorated in gold and colour; the subjects of the panels are scenes in the Saviour's life. Mr. George Frampton, A.R.A., carved out the sculpture, Mr. R. Bridgeman, of Lichfield, the woodwork, and Mr. T. R. Spence, of London, the decoration.

The west window of Coleshill Church, Warwickshire, has been filled with stained glass as a memorial; the work was executed by Mr. T. W. Camm, of Smethwick.

The Hanwell Park Estate is now rapidly developing, several quaint little houses, costing from £1,200 to £1,400 per pair, have been built, and others are being started. The architects are Messrs. T. W. F. Newton and Cheadle, 121, Colmore-row, Birmingham, and the roads have been made by Messrs. Killingback and Co., of Camden Town. Mr. David Edwards, builder, of Barnt Green, has carried out the first set of houses.

A new gallery has been opened at the Palace of Versailles, in which are grouped all the latest acquisitions, including a silver statue, by Bosio, of Henry IV. as a child; the bronze bust of Louis XII., dated 1505, and two pictures by Carrey; a sketch by David of the Empress Josephine, his study of Marat after death, a portrait of Napoleon I., by Gerardi; and a sketch by Carpeaux, depicting Napoleon III. in his coffin.

The well-known half-timber 16th-century mansion at West Bromwich, known as the Oak House, which was in the market for sale, has been purchased by the present mayor of that borough, who has presented it as a free gift to the town. It will probably be utilised as a museum and picture gallery. We illustrated the house from Mr. W. Talbot Brown's measured sketches, perspective and details, in our issue of October 12, 1877.

The new esplanade at West Cowes, I.W., is now completed. It extends from the town westward, in the direction of Gurnard, for a distance of over 400yds., and consists of a roadway 24ft. wide, with broad pavements on either side. The retaining wall is of cement concrete, faced with concrete blocks, with piers at intervals. The work has been carried out jointly by the West Cowes Local Board and the Ward Estate, at a cost of over £2,300, from the plans of Mr. N. F. Dennis, A.M.I.C.E., engineer to the board.

A half-length portrait of Mr. H. H. Fowler is being painted from special sittings by Mr. A. S. Cope, for the Incorporated Law Society, in the hall of which it is intended to be hung in commemoration of the fact that the Secretary for India is the first solicitor to attain so distinguished a position. It represents the right hon. gentleman seated at the table in his private room at the India Office.

The town council of Inverness have under consideration a report prepared by Mr. James Fraser, C.E., on the works necessary to augment the water supply. He recommends that the pipes from Loch Ashie to the town be doubled, and that a new supply be laid on from Loch Duntelchaig, the total estimated cost being £31,000.

Legal.

SKY-SIGNS AGAIN.

THE activity of the London County Council in its crusade against sky-signs is, doubtless, well intended. But its advisers seem inclined to go beyond the mere statutory law in their desire to put down what they consider obtrusive names erected over shop-fronts. The most recent case is that of Harrod's Stores, Limited, and the company was summoned for unlawfully retaining a sky-sign over one of their shops which had been put up without a license, and had not been removed according to notice. The thing complained of consisted of a scroll name-board, 6ft. high in the middle and 4ft. at either end, extending for 21ft. over the parapet of a shop, which was built out in a forecourt 30ft. in advance of the main building. It was contended on behalf of the London County Council that as this erection was more than 3ft. in height above the parapet of the shop, it must be a board requiring to be licensed by the Council. The defence was that the structure did not amount to a sky-sign at all, and did not come within the Councils' General Powers Act of 1893, and so could not be interfered with.

Mr. Sheil, the magistrate, held that the whole case turned upon the definition of a sky-sign given in Section 17 of the Act, and which contained the words "visible against the sky." This was the governing phrase in that definition. He had himself seen the scroll name-board, and as a matter of fact it was not "visible against the sky." In his opinion to call it a "sky-sign" was simply absurd. Indeed, its position was such that as it covered the front of a sky-light upon the roof of the shop, its removal would not even be an æsthetic advantage. So he dismissed the summons, with five guineas costs, to be paid by the London County Council, and in reply to their counsel's request that he would state a case, answered that he should be happy to do so if he could, in order that the matter might be argued; but that he should have to find as a fact, and so state it, that the scroll-board was not "visible against the sky." He was afraid that ended the whole matter. The prosecution still said that the magistrate's decision would be reviewed, although we do not see how it is to be done. In the mean time it looks as if the money of the ratepayers had been wasted in another needless and fussy interference with the liberty of shopkeepers in putting up names over their own shop-fronts.

FRED. WETHERFIELD, Solicitor.
1, Gresham Buildings, Guildhall, E.C.

NOTE.—All questions for reply in this column must be headed "BUILDING NEWS," and must reach my offices, as above, by *Tuesday* morning to insure answer same week.

J. J.—This is a matter for arrangement with the adjoining owners. I don't think there is any legal liability, as they can build to any height they like if neither air nor light, to which you have a prescriptive right, is interfered with.

J.—SURVEYOR'S CHARGES.—You should summon him for the scale charge as sent in, and which seems to be reasonable. Under the circumstances, I think they would be allowed by the judge, especially upon the agent's admission as to the charge per day, if reckoned in that manner.

WALL.—OWNERSHIP.—If B. decides to restore the wall to its original condition, I do not think A. can receive any damages, because he has suffered none, nor can he recover the legal costs he has been put to. I should say the wall belongs to A., and that it is not a party-wall.

◆

The foundation-stone of a new chapel, now being added to the Wolverhampton Orphan Asylum, was laid on Friday, with Masonic ceremony, by Earl Dartmouth. The chapel will seat 400 children.

Sir John Forrest, one of the foremost statesmen in the Government of Western Australia, in a recent address to his Bunbury constituents, observed that the Ministry now in power had constructed 400 miles of Government railways, raising the total mileage to 1,200, and the cost of constructing the recent lines has been under £3,000 per mile.

Mr. Justice Kekewich recently decided that the consent of the Charity Commissioners was not necessary for the sale of a piece of land at St. John's Wood, by the Clergy Orphan Corporation, to the Manchester, Sheffield, and Lincolnshire Railway Company. The ground of the judgment was that any charitable society wholly maintained by voluntary contributions was excluded from the operation of the Charitable Trusts Act. The Commissioners appealed, and on Friday the Court of Appeal confirmed the decision of the Court below.

LEGAL INTELLIGENCE.

LOCAL BOARD'S DISCRETION AS TO FRONTAGE LINES.—THOROLD V. THE NORTH ORMESBY LOCAL BOARD.—In this action, in which judgment was given on Friday in the Queen's Bench Division by Mr. Justice Mathew and Mr. Justice Kennedy, an interesting point was raised with reference to the principle upon which Section 3 of the Public Health Act, 1888, as to the power of local boards as to the erection of buildings beyond the front main wall of houses on each side, is to be construed. In the Public Health Act, 1888 (51 and 52 Vict., c. 52), section 3, it is provided that it shall not be lawful in any urban district without the written consent of the urban authority to erect or bring forward any house or building in any street or any part of it beyond the front main wall of the house or building on either side thereof in the same street. The Local Board District of Ormesby has a population of about 9,000, and comprises in its area two places—the village of Ormesby, which is mainly rural, having a population of about 150, and the modern town of North Ormesby, with a population of over 8,000. Part of the main road leading from Middlesbrough and North Ormesby to the village of Ormesby is named Westbourne-grove, and forms one of the streets of North Ormesby. In November, 1893, Thorold built a dwelling-house on the west side of Westbourne-grove, setting back the house 26ft. from Westbourne-grove, and afterwards submitted to the local board plans of four small cottages intended to be erected by him in the same grove, from which they were set back 10ft. only. The distance between Thorold's residence and the cottages to be erected is about 90ft. The local board were of opinion that the "building line" in that part of Westbourne-grove was fixed by Thorold's house, the front wall of which was 26ft. from Westbourne-grove, and then they rejected the plans as being in contravention of the Act of 1888. This was an application on behalf of Thorold for a *mandamus* to the board to approve the plans. After a long argument, the Court came to the conclusion that the board were not justified under the enactment in refusing their approval of the plans. Mr. Justice Mathew, in giving judgment, said: When it is proposed virtually to take away a man's land we are bound to look carefully into the circumstances. Where there is no continuous line of building of any kind the enactment can hardly apply. Where land is laid out for building purposes it may be different. But we have to deal with the case as it stands. It appears to me that there is no evidence of the existence on the site of the original building of any line of frontage. Mr. Justice Kennedy concurred. Rule absolute for a *mandamus* to the board to approve the plans.

CLAIM FOR ARCHITECT'S FEES. — WILLIAMS V. RAE.—In this action tried at Liverpool Assizes on Friday by Mr. Justice Bruce and a jury, Lewis Osborne Williams, architect, of Liverpool, sued W. Wilson Rae, estate agent, of Lord-street, Liverpool, for £130 for work done in preparing plans for two semi-detached villas at Liscard. Plaintiff said he was commissioned by the defendant to prepare plans for two houses in Seabank-road and Manor-road, Liscard, the total cost to be £1,200. Plaintiff acted in the negotiations for the purchase of the land at 4s. 6d. a yard, and drew plans. Defendant wanted various alterations effected, and they were made by the plaintiff. The lowest tender was £2,100, and upon this sum plaintiff claimed 2½ per cent. for preparing the plans and ¼ per cent. for procuring the tenders, also £53 for services rendered by a quantity surveyor. The defendant asserted that his limit was £1,200, and he was never apprised that the alterations in the plans would mean greater cost. Defendant added that the plans were no use to him, as he could not build up to them, and he denied the statement that he had been making use of the plans. The plaintiff said it was ridiculous to think he was to go on rendering extra services and receive no extra remuneration. Defendant's counsel suggested that, assuming the defendant ought to pay anything, £25 was sufficient. The jury failed to agree, and were discharged.

IN RE PETER SMITH.—Peter Smith, builder and contractor, of Hope-road, Sale, a bankrupt, was examined by the Official Receiver in the Manchester Bankruptcy Court on Monday. He had been in business as a contractor, he said, since 1874. Until now he had never been insolvent nor had to make any arrangements with his creditors. The statement of affairs showed £1,263 unsecured liabilities and assets which should realise £717. At least £700 of those assets were represented by equities. If the equities were worth nothing his deficiency would be nearly £1,300. The cause of his difficulties was inability to realise on houses that he had built. Those houses were not "jerry" built. He bought a house in Higher Broughton for £40 and raised £1,000 on it on mortgage. The debtor explained that the property belonged to a trust; he spent £120 on the house and let it on a lease for seven years at £95 a year. The examination was adjourned.

PARTY WALLS AT DENMARK HILL.—The case of Sloman *v.* Mulholland, on Wednesday, came before Mr. Justice Romer in the Vacation Court, it being a motion to restrain the defendant from trespassing on the plaintiff's ground by the erection of a wall, which the defendant had been running up by the side of the plaintiff's premises until the threat of the action. Counsel for the plaintiff said that his client was the owner of certain premises at Denmark Hill, under a long lease. The wall in question was a wall to support a theatre which is being built by the side of the plaintiff's premises. The property had all been laid out in building plots, and the plaintiff took his premises on the understanding that the adjoining land would be laid out in the same way. His (the learned counsel's) contention was that the defendant, with full notice of the plaintiff's rights, and after taking certain preliminary steps to answer those rights, had trespassed upon them by erecting a wall partly on his own land and partly on the plaintiff's. The defendant said that it was absolutely essential that his theatre should be supported by the wall, and he had served the plaintiff with a party-wall notice under the Metropolitan Buildings Act. Mr. Justice Romer: Does he admit that it is on your land? Plaintiff's counsel replied that he thought the defendant did. What he (defendant) said was that he had proceeded under the Metropolitan Buildings Act. Mr. Justice Romer: Was there a wall there before? The learned counsel replied in the affirmative. Mr. Justice Romer: I think there is a very nice question to be tried, and I won't do it. The learned counsel said that there were two questions to be tried, and one was as to blocking out the plaintiff's lights. That was a very nice question to be tried. Mr. Justice Romer: Well, they can be tried together. I won't do it. Do you think I am going to try that now on motion? The learned counsel stated that the trespass was not disputed. Mr. Justice Romer: I am not so sure of that. I am not going to decide whether the defendant is entitled to do what he has done under the Metropolitan Buildings Act on a motion. The learned counsel replied that all he wanted was that the matter should stand *in statu quo* till the trial. After some further discussion it was arranged that the motion should stand till the trial.

◆

On Thursday afternoon in last week the Marquis of Salisbury, as Chancellor of Oxford University, unveiled a statue of Thomas Sydenham, which has been placed in the University Museum by the Warden and Fellows of All Souls, which was Sydenham's college. The statue is in Caen stone, the artist being Mr. Hope Pinker, and the design is partly moulded from a portrait of Sydenham by Mrs. Mary Beale in the Royal College of Physicians, and partly from the portrait by Sir Peter Lely at Oxford.

The Marquis of Dufferin and Ava, Lord Warden of the Cinque Ports, has headed a movement which has for its object the preservation of the historic buildings of the ancient Cinque Port of Rye. These include the Ypres Castle, built by William de Ypres, Earl of Kent, upwards of 700 years ago, and purchased by the corporation in 1495; and the Land Gate, erected in 1360. To enable the committee to carry out their project £700 is required.

About six thousand joiners struck work in Pesth on Monday because their demand for an increase in wages was refused by their employers. Those men whose masters have agreed to raise the wages in accordance with the demands of the workmen remain at work. They have promised to contribute 10 per cent. of their weekly earnings to the strike fund; but this will in all probability not long be necessary, as the employers are one by one giving in to the men's requirements.

At a special meeting of the proprietors of the Theatre Royal, Newcastle-on-Tyne, the plans of alterations to the theatre prepared by Mr. Walter Emden, M.S.A., of London, and Mr. W. L. Newcombe, of Newcastle, were explained by those architects, and were generally approved. The alterations will be commenced next May, and will take five months to complete. They comprise the demolition of the interior of the theatre, and its entire rebuilding on the lines of the best London theatres. Only the four walls of the building will remain untouched.

The monthly return of the Board of Trade states that, on the whole, the building trades remain almost stationary, though in certain districts there is a good demand for men. The plumbing and painting branches show a decline. The percentage of unemployed members in unions making returns is 3·6, compared with 3·5 at the end of June. The furnishing and woodworking trades are still quiet; the percentage of unemployed in unions making returns remaining at 4·4. Trade disputes again show a considerable decrease upon the figures of the preceding month, 66 having been observed as compared with 85 in June and 55 in July, 1893. The number of persons involved in the disputes also is not large, no dispute of great importance having occurred to swell the total. Of the new disputes 16 took place in the building trades.

WATER SUPPLY AND SANITARY MATTERS.

Heywood.—The first sod was cut on Monday at the site for the new sewage purification works at Botany, for the borough of Heywood. Messrs. Townsend, Watson, and Yates, are the contractors for the work, which will cost £26,000. The land has cost another £3,200. It covers nearly sixty acres. In addition to putting sewage works upon it, the town council are about to erect on one portion an infectious diseases hospital, the contract for which has already been let to Mr. D. Diggle, a local builder and contractor. The system of treatment of the sewage will be by precipitation by chemicals in tanks, after which the effluent will be treated in sand and polarite filters. There will be six tanks 90ft. by 30ft., and a similar number of filters of 60ft. by 30ft. A water-wheel, 10ft. high, will give the motive power for the chemical machinery.

Melton Mowbray Sewerage.—A Local Government inquiry was held on Wednesday at the Town Hall, Melton Mowbray, before Colonel J. Ord Hasted, R.E., of the Local Government Board, for permission to borrow £4,050 for improvements at the sewage works. Mr. Edmund Jeeves, the surveyor to the local board, explained the scheme, stating that after investigating numerous systems of sewage disposal, the board had decided to adopt the International system of ferozone and polarite, as being the most economical and efficient process. The sewage is at present treated by the lime process, which has given rise to serious complaints of pollution and the destruction of fish life. The board have now determined to abandon the old system of tanks, and to construct others upon the continuous upward-flow self-cleansing principle, as embodied in the Candy tank, which has been also adopted by H.M. Government. In addition to the polarite filters, the works will be provided with three clarifiers to economise chemicals and save labour. There was no opposition, and it is intended to carry out the work forthwith.

CHIPS.

A receiving order has been made in the case of William Henry Waterman, of King's Arms-yard, Moorgate-street, E.C., architect.

Mr. Arthur Loader, architect, has been re-elected chairman of the sanitary committee of the Brighton town council.

At a meeting in Belfast on Friday, the Lord Mayor presiding, it was resolved to hold an Industrial Exhibition there in the early months of 1895. The Exhibition will be arranged in the quadrangle of Linenhall Buildings, which will shortly afterwards be removed.

On Saturday, while John Arnot, a mason, was engaged on a building in course of erection at Bruntsfield-place, Edinburgh, he was struck on the head by the jib of a crane, and was killed almost instantaneously.

A wing is about to be added to the Heatherdene Convalescent Home at Harrogate, from plans by Mr. J. Eltringham.

A cottage hospital is in course of erection at Porth, Glam. The builders were Messrs. Charles Jenkins and Son, of Porth, whose tender was accepted at £2,775.

Probate duty has been paid on £113,035 17s. 3d. as the value of the personal estate of Mr. Philip Debell Tuckett, of Child's Hill House, Hampstead, and of the firm of P. D. Tuckett and Co., Basinghall-street, auctioneer and surveyor, who died on the 24th July last, aged sixty years.

The partnership heretofore subsisting between C. B. Young and A. G. Spencer, architects and surveyors, Coleman-street, E.C., under the style of Young and Spencer, has been dissolved.

The dissolution is announced of the partnership heretofore subsisting between A. R. Stenning and W. J. Jennings, architects and surveyors, Canterbury, practising under the style of Stenning and Jennings.

The new buildings which have been erected for technical instruction by the Oxford corporation, at a cost of about £5,000, were opened on Tuesday by the mayor.

The new workhouse infirmary, Guisborough, which is being erected from the plans of Mr. Thomas Stokes, architect, Thirsk, is now nearing completion. It is being warmed and ventilated throughout by means of Shorland's patent Manchester stoves, patent exhaust roof ventilators, and improved inlet panels, the same being supplied by Messrs. E. H. Shorland and Brother, of Manchester.

The work of laying the pipes for carrying the electric cables for the installation which is about to be effected by the corporation of Newport, Mon., was commenced on Monday on a section in Dock-street, Newport. Messrs. Fowler, of Leeds, are the contractors.

Our Office Table.

Four fresh pictures, representing as many schools, have been hung this week at the National Gallery. No. 1409 is a "Marriage of Saint Catherine" by Andreas Cordelle Agii, a Venetian painter who died in 1528, and was previously unrepresented in the collection; the picture, which is signed by the artist and dated 1504, measures 34in. wide by 25½in. high, and is hung on the third screen in No. VII. room. The colouring is very rich, and the treatment of the subject is simple, only four figures being introduced. The Virgin, who is attired in red and green, with a curious white head-dress panelled in black lines, is holding the Infant Christ, who is nude, save for a coral bracelet and a silver-mounted coral suspended on his neck by a string. He is placing the mystic ring on the finger of St. Catherine, who wears an embroiderd green bodice and scarlet dress, and is kneeling. On the other side of the Madonna stands St. Joseph, a bearded and comparatively youthful figure. Rays of light spring from the head of Jesus, while those of the other figures are encircled by nimbi. In the same room on the east wall is an "Adoration by the Shepherds," by Sebastiano Luciani, usually known as Sebastiano del Piombo, 1485-1547. It has been lent by Earl Northbrook, and is therefore not numbered; it measures 42in. by 38in. high, and contains the Madonna and Child, St. Joseph, and Three Shepherds. The French school, very slenderly represented till recently, has been further strengthened by a work entitled "Tasting" by Le Nain, a seventeenth century artist, of whose work this is the first example. It is numbered 1425, and is hung on the north wall of room XIV. It measures 12in. wide by 10½in. high, and shows in the centre an elderly woman dressed in black, but with white head-dress, seated, having beside her a stone jar of liquor. On the right a youth, gaily arrayed in a scarlet coat, green pantaloons, and bluish leggings, is sampling the wine from a long glass; while ranged in a row a young woman and three children, all with long, unkempt locks, rubicund faces, and coarse aprons, await their turn. The effect is Dutch, rather than French, in subject and treatment. On the south-west pier of the Dome is hung the fourth new work, a rendering of "Tobias, the Angel, and the Fish" (Tobit vi. 1-4), by Adam Elsheimer, 1578-1621. It is executed on copper, as was usual with this artist, and is only 9in. wide by 6½in. high, and is bright in colouring and harmonious in its combination of landscape and figures. The youth Tobias, clad in blue and red, is carrying by a string the immense fish which has leaped to him from the Tigris. Behind him, with hovering wings curiously protruding through his blue tunic, is a very substantial angel, who is evidently counselling the lad to extract the heart, gall, and liver from the fish as a perfect cure for the blindness of Tobias. The greater part of the picture is occupied by a wooded landscape, and beyond the trees and below a cloud-flecked blue sky are a lake, some mountains, and towers, intended to recall the city of Ecbatana. There is only one other work by Elsheimer in the national collection.

The reply by Mr. Poynter, R.A., the new Director of the National Gallery, to the complaints made last week by Sir J. D. Linton and Mr. Orrock, as to the condition of some of the British works of the close of the last century, is a recapitulation of the statement made in May, 1893, by Mr. Shaw Lefevre, on the authority of Sir Frederic Burton. That statement was to the effect that the English pictures in the gallery do not show increased deterioration; that the evil effects of the use of asphaltum by Sir Joshua Reynolds and other painters of that period could not be averted by additional moisture in the atmosphere; that the temperature of the rooms in winter is not allowed to exceed 56° or 58° Fahr.; and that in the rooms containing the panel pictures by old masters shallow water tanks are used, "with other precautions," though the late Dr. Percy pronounced the hygrometrical condition of the air to be normal. On the other hand, Mr. C. E. Johnson, the well-known landscape painter, asserts as the result of frequent examinations of these pictures painted with bitumen, that during the late directorship the deterioration went on, and is going on now in an increased ratio from some cause or other. He remarks that it "would have been more satisfactory if Mr. Poynter, instead of quoting the authority of his predecessor, had given promise of increased care and watchfulness over works which are the most supreme efforts of genius which our country has produced or the world has even seen."

The Library Committee of the City Corporation, in their Report on the recent Loan Art Collection at the Guildhall, state that during the three months the pictures were on view, in all, 300,366 persons passed the turnstiles, being an average of 3,580 per day. The exhibition was opened to the public on six alternate Sundays, when the total attendance was 17,530, showing an average of 2,921 per Sunday. On each occasion the greatest order prevailed, no single instance of damage or disturbance having occurred. Of the descriptive and historical catalogue prepared by Mr. A. G. Temple, F.S.A., the Art Director, 38,569 copies were sold at the price of sixpence each, realising the gross sum of £964—a sum which not only defrayed the entire cost of the catalogue, but left a balance at the committee's disposal which would enable them to dispense with the greater part of the amount of £450 granted by the Corporation to defray the expenses of the exhibition. The committee conclude by referring to "the excellent, experienced, and skilful manner in which Mr. Temple, the Director and Secretary of the Art Gallery, has discharged his duties, and the marvellous success which has attended his exertions by the organisation of the three art loan collections in Guildhall." The total net cost of the exhibition was £443 only.

An American report states that the *Sun*, of New York, proposes to erect a building 32 stories high on a frontage of 75ft., and a structure is being planned "to rise 2,640ft. (?)—a full half-mile above the ground, and thereby reach more than double the height of any structure ever designed." Surely this must be another Yankee tale. Of course, with the passenger elevator such heights are possible, if foundations and materials can be found to bear the weight.

The Arts and Crafts Exhibition, held during the week at Oxford, under the auspices of the Rural Industries Society, has been organised on behalf of the actual producers and designers without the intervention of any middle-man. Miss Sturge is to be congratulated on her success in training the children of Connemara to make baskets, in arranging for the supply of material, and organising a just method of sale. There was a large consignment of Irish goods, including bog-oak carvings, knitted and netted work, done mostly by widows and orphans, and homespun cloth made in the cabins of Donegal. Iffley and Hitchin both sent contributions of needlework and embroidery. Leeds and Macclesfield sent their contingent, and there was excellent work from Windermere. Corstorphine, in Midlothian sent a collection of salvers, sconces, and trays. There were specimens of wood-carving from the Art Wood-carving School at Kensington, from the Social Guild at Nottingham, and from the Ascot class, as well as Bonnyglen, Inver, Leatherhead, and Mayfield. A skilled potter from Castle Hedingham, Essex, who was working on the spot, excited great interest. Pillow lace, of which a very large assortment had been sent from Princes Risborough and Blackrock, Dublin, was also being made at the exhibition. The work from Leighton Buzzard included embossed and printed leather goods.

There is given in *Indian Engineering* an elevation of the new Law College, Madras, from the designs of Mr. Irwin, C.I.E., consulting architect to the Government of Madras, and the designer of the Vice-Regal Lodge at Simla. The architect for the Law College, owing to its proximity to the new Law Courts, has been obliged to make his work harmonise with the Courts. The elevation presents an imposing building, with lofty arched centre, flanked by towers containing staircases, and surmounted by circular cupolas in the Indian style. The wings are of two stories of arched apertures inclosed by piers, and are terminated at each end by a tower with cupola. The details and general architectural features are in accord with the style prevalent in this part of India rather Gothicised.

An interesting note on the structure of steel has been sent by M. F. Osmond to the Paris Academy of Sciences. He found that with a moderately hard steel, containing ·35 per cent. of manganese and ·45 per cent. of carbon, the structure varied gradually in samples heated to 825° C., and quenched in water at 15° C., after cooled to different temperatures between 720° and 640° C. With hard steel, containing as much as 1·24 per cent. of carbon, the variation is more rapid, and the temperature of maximum hardening was found to be close to that of no hardening at all. The structure, it is stated, in steels of moderate hardness, indicates the maximum heating, the temperature at hardening, and the rate of cooling. An interesting note, but not of much practical value to the smith and tool-maker.

Prizes varying in value from £120 to £40 are to be awarded by a special commission appointed by the Prefect of the Seine for methods of sterilising river water so as to render it potable, and that in sufficient quantity to supply a school, a barrack, or a town at a moderate cost per gallon. The particulars of the methods suggested should be sent to the Préfecture de la Seine, Paris, before Sept. 15.

◆

CHIPS.

On Wednesday night, in the House of Commons, the order for the second reading of the Plumbers' Registration Bill was read and discharged, the Bill being withdrawn owing to the pressure on the time of the House.

At the meeting of the Sheffield City Council on Wednesday week, a memorial against the use of granite sets came up for consideration, and was referred to the highway committee, with instructions to report as early as possible. A good deal was said in favour of granite sets, and several councillors hinted that the agitation against their use was very much overdone.

A cottage hospital is about to be built at Bridgend, from plans by Messrs. Lambert and Rees.

A new band-stand, presented to the Recreation Ground at Sevenoaks by a local resident, was handed over to the local board on Thursday in last week. It has been constructed by Messrs. McFarlane and Co.

A tower which is being added to Tyndale Chapel, White Ladies-road, Bristol, is rapidly approaching completion. Messrs. Henry Crisp and Oatley, Clare-street, Bristol are the architects, and Mr. E. Walters, of the same city, is the contractor. A new Caen stone pulpit has been erected in the chapel by Messrs. R. Wilkins and Son, of Surrey-street, Bristol.

The town council of Widnes decided, on Tuesday, to purchase the portion of Moss Brook estate lying to the north of the Cheshire Lines Railway for £5,000, and containing about 49 acres, for the purpose of a public cemetery. It is estimated that to prepare 15 acres for present requirements, build three chapels and a house, will cost £6,000, making the total cost of the cemetery £11,000.

Davies, H.	12,641	4	4
Davies, D.	12,641	0	0
Allen, J., Cardiff	12,411	0	0
Symonds, W., and Co., Rectory-road, Cardiff (accepted)	12,359	19	3

Chelsea.—For the erection of a new hotel, Hans-place, Chelsea, London. Messrs. Read and Macdonald, Oxford-street, W., architects. Quantities by Mr. W. H. Elsmore, Barnes, London:—

Stephens, Bastow, and Co., Ltd., Bristol (accepted)	£38,250	0	0

Dartford.—For iron fencing to the airing grounds of the Gore Farm Hospital, Dartford, for the Metropolitan Asylums Board. Messrs. A. and C. Harston, 15, Leadenhall-street, architects:—

Bayliss, Jones, and Bayliss, Cannon-street (accepted)	£808	11	6

Dursley.—For new girls' classroom, National Schools, Dursley. Mr. J. Fletcher Trew, M.S.A., Gloucester, architect:—

Hafman	£170	0	0
Bloodworth and Son	125	0	0
Sellick (accepted)	110	0	0
Bradley	105	0	0

East Compton, Dorset.—For building new coach-house, alterations to stables, &c., for Col. R. Williams. Mr. A. L. T. Tilley, 16, Cornhill, Dorchester, architect:—

Slade, C. E., Dorchester (accepted)	£477	10	0

Eastleigh, Hants.—For laying about 17,658 yards run of 12in. by 6in. Swanage stone kerbing, and the same length of Staffordshire channel blocks, for the Eastleigh local board. Mr. Galbraith, surveyor:—

Reeks, F., Lymington	5s.	1d.	per yard for both.
Lowman and Sons	4	8	,, ,, ,,
Ashhilt Limestone Concrete Company	4	8	,, ,, ,,
Saunders and Co., Bournemouth	4	4	,, ,, ,,
Osmond, F., Southampton	4	1½	,, ,, ,,
Crook and Batten, Southampton	3	10½	,, ,, ,,
Free and Sons (accepted)	3	4½	,, ,, ,,

[Surveyor's estimate, 4s. 3d. per yard run.]

Ewell.—For painting, repairs, and water supply to the Spring Hotel, Ewell, Surrey, for Messrs. Nalder and Collyer's Brewery Company, Ltd. Mr. Robt. M. Chart, F.S.I., &c., Union Bank Chambers, Croydon and Mitcham, Surrey, architect and Surveyor:—

Goulder, E., Croydon	£112	15	0
Hole, J., Sutton (accepted)	92	0	0

Fay Gate, Sussex.—For alterations and additions to Beaumont, Fay Gate, Sussex, for Mr. J. Moore. Mr. T. Potter, 49, London-road, Sevenoaks, architect. Quantities by architect:—

		Time.
Wiltshire and Son, Sevenoaks	£3,374	6 months
Rowland Bros., Horsham	3,100	6 ,,
Longley, J., and Co., Crawley	2,897	4 ,,
Peters, P., Horsham (accepted)	2,873	4 ,,
Ockenden, T., and Co., Crawley	2,871	9 ,,

(Architect's estimate, £2,888.)

Fulham.—For certain alterations and additions to the Fulham Union Workhouse, Fulham Palace-road, W., for the guardians of the Fulham Union. Mr. A. Saxon Snell, F.R.I.B.A., 22, Southampton Buildings, Chancery-lane, W.C., architect. Quantities by architect:—

Dupont, F., Colchester	£7,259	0	0
Foster and Dicksee, Chelsea	5,878	0	0
Newman, J. H., Bloomsbury	5,690	0	0
Wall, H., and Co., Kentish Town	5,497	0	0
Lovatt, H., King's Cross	5,306	0	0
Nightingale, B. E., Albert Embankment (accepted)	5,095	0	0

Gloucester.—For laying new sewers and forming new roads at Tuffley. Mr. J. Fletcher Trew, M.S.A., Gloucester, architect:—

Loomey	£785	10	0
Rice	723	10	0
Leat	685	0	0
Freeman and Jones (accepted)	680	0	0
Hyam	460	0	0

Gloucester.—For enlarging the City Printing Works, for Mr. J. Jennings. Mr. J. Fletcher Trew, M.S.A., Gloucester, architect:—

Cullis	£598	0	0
Allard	553	0	0
Freeman and Jones (accepted)	526	10	0

Heating apparatus for above:—
Crispin and Sons (accepted).

Heywood, Lancs.—For the erection of an infectious diseases hospital pavilion, for the town council:—
Diggle, D. (accepted).

Heywood.—For supply of new 10in. water main, to be laid from Peel-street to Wham-bar, for the town council:—
Staveley Iron Co., Ltd. (accepted).

Homerton.—For fitting up hot water supply and warming apparatus to three new blocks at the Eastern Hospital, The Grove, Homerton, for the Metropolitan Asylums Board. Messrs. A. and C. Harston, 14, Leadenhall-street, architects:—

Kite, C., and Co.	£1,400	0	0
Fraser, J., and Sons	1,243	0	0
Strode and Co.	1,133	0	0
May, J. and F.	1,125	0	0
Potter and Sons	1,113	0	0
Christie, J. and C.	1,111	0	0
Sugg and Co.	1,081	0	0
Benham and Son	1,080	0	0
Vaughan and Brown	1,050	0	0
Murdock and Cameron	995	0	0
Ellis, J. C. and J. S.	995	0	0
Clarke and Sons, 43, Moorgate-street (accepted)	970	0	0

Horley.—For repairs at the Prince Albert Inn, Horley Surrey, for Messrs. Nalder and Collyer's Brewery Company, Ltd. Mr. R. M. Chart, F.S.I., &c., Union Bank Chambers, Croydon and Mitcham, architect and surveyor:—

Laker, Horley	£112	10	0
Wilkinson (Redhill)	107	0	0
Crouch, A., Worthing (accepted)	87	7	0

Inverness, N.B.—For the construction of the last section of the direct Inverness and Aviemore Railway, from Inverness ticket-platform to Culdoich in Strathnairn, a distance of seven miles, for the Highland Railway Company:—

Brand, Chas., and Co., Glasgow (Accepted.)	£104,900	0	0

Isle of Thanet.—For renovating and painting the workhouse, for the Minster board of guardians:—

Paramor and Sons, Margate	£290	0	0
Austen, Birchington (accepted)	206	3	4
Jarman and Sons, Ramsgate	200	11	6

Islington.—For the erection of the Northern Polytechnic Institute, Islington. Mr. Charles Bell, F.R.I.B.A, architect. Quantities by Mr. C. G. Roberts:—

	A.	B.	C.	D.
Woodward and Co.	£9,399	£18,425	£6,808	£34,612
Dove Bros.	8,885	17,845	6,425	33,155
Castle, W. and H.	8,580	17,537	6,240	32,357
Lown and Sons	8,512	17,406	6,264	32,182
Dearing and Son	8,320	17,000	6,050	31,370
Wall, C.	8,300	17,000	5,900	31,200
Mattock Bros.	8,177	16,921	6,033	31,131
Lawrance and Sons	8,193	16,710	5,977	30,880
Williams, G. S., & Son	7,800	16,743	6,100	30,643
Grover, J., and Sons	8,039	16,379	5,784	30,202
Williams, H. J.	8,127	16,180	5,980	30,287
Goodman, W.	8,000	16,410	5,823	30,233
Macfarlane Bros.*	7,593	16,191	5,938	29,722

* Accepted.

A, Section 1; B, Section 2; C, Section 3; D, Total.

King's Cross.—For block of artisans' dwellings and shop at King's Cross-road, for Mr. J. C. Wall. Mr. H. H. Tasker, architect:—

Turner	£2,697	0	0
Lidstone and Son	2,247	0	0
Lawrence and Son	2,154	0	0
Hunt, J.	2,099	0	0
Dearing and Son	2,068	0	0
Shurmur, W.	1,990	0	0

SOME NOTES FROM THE BRITISH ASSOCIATION.

THERE are very few subjects with which the architect has not, or is not liable to have, some concern. But it is not often that an address on biology has a direct bearing on matters of construction. It is so, however, with Professor Bayley Balfour's paper, which opened the proceedings of the Biological Section in the recent meeting at Oxford, and which mainly dealt with the planting and management of forests.

The world, Professor Balfour tells us, is using timber faster than it grows it. And much of it is being used in novel ways. The carpenter and the joiner and the cabinet-maker are no longer the only workmen, on a large scale, to whom it is an indispensable material. Wood-pulp is in great demand for foreign industries, and wood-silk is being manufactured in England. Whether these uses of wood require the same kinds and the same qualities which are preferred for building, the Professor does not say: but it would seem likely that much which would be valueless to the builder may be turned to account in these novel trades. Yet, however this may be, there seems no doubt that timber is likely to get scarcer and scarcer. In it, as well as in coal, the world is rapidly making away with the accumulations of ages; and it is to be feared that ours will hereafter be remembered as the spendthrift century. Future times will think to how little artistic purpose we turned our profusion of splendid pitch-pine, while they are never likely to find it either so excellent or so cheap. *We* look back with envy to the Middle Ages, when every cottage was built with oak; and our successors may, in like manner, envy us, who could at least get plenty of fir.

In Norway, raw timber is every year becoming dearer and scarcer. The Swedes are actually importing wood from America, when large scantlings and great lengths are required. In both Sweden and Norway the primeval forests are being rapidly exhausted. At Riga, the supply of oak has come to an end; and there is a proposal in some of the Baltic countries to put an export duty on all timber. The Canadian forests, too, are beginning to show signs of exhaustion under the enormous drain upon them, both from Europe and from the United States. And in the States themselves, a Government report stated, in 1892, that the approaching end of the timber supply is coming plainly into view. From these facts, Dr. Balfour drew the very natural inference that more forests ought to be planted, and that it should be a national duty, both in Britain and elsewhere, to see that the supply, as far as possible, is equal to the demand.

To insure this will take a long time. Experience makes us rather sceptical about its being done at all in anything like an adequate way. Nations, even more than individuals, have a tendency to live from hand to mouth; and the planting of forests is not a thing that will satisfy this tendency. It takes more faith and more patience than most communities are possessed of: first, to lay out large sums in planting, and then to pay the yearly charges for culture and management, in the hope of being repaid with interest at the end of a hundred years or so. And in the course of three generations there is no saying what changes of public policy may occur. At the present moment, farming in England does not pay, and it may be thought that forestry would pay better. But in fifty years time the case may be quite different. Corn will not be exported as cheaply from America then as now. We may once again have to look to our own soil for most of our food supplies; and then, all forests, except those planted on land which is fit for nothing else, will probably be cut down and sold for what they will bring.

At first sight it seems wonderful that the biggest forests on the globe—those which run nearly across the northern part of South America on each side of the Amazon, and cover an area of more than a million square miles—should yield us nothing. They contain magnificent trees, many of them first-rate in quality. They adjoin the largest river in the world—why do we never see their produce here? Why, again—for this is stranger still—do the people who live on the very edge of these forests actually send to North America for nearly all the wood they use? Such a carrying of coals to Newcastle is almost unparalleled elsewhere; and the explanation of it, when once it has been given, is not likely to be forgotten. The most useful forests are those which are each composed of one single kind of timber tree, or, in any case, of a very few kinds, all more or less saleable. Such are the forests of Canada, and those of the Baltic countries, which are made up of a few species of fir, and in which each species consequently occurs in countless numbers. But with the tropical forests it is quite otherwise. Nature, in those torrid climates, breaks out into endless variety. In Brazil, especially, it is a rare thing to see two trees of the same species together. Even the canoes on the Amazon, Dr. Wallace tells us, are, in most cases, constructed of several different kinds of wood, from the impossibility of getting, without vast labour, enough of one sort even to build a boat with. Many of the trees are soft and spongy, and would be worthless to the carpenter. Many others are so hard that no ordinary tools would work them. And though there remain a large number that would be extremely valuable, these are so widely scattered it would never pay to collect them. They are dotted down here and there in the interior of the forest, and a separate road would have to be cut through it to bring every separate tree out when felled. The great Brazilian forest, therefore, is likely to remain as useless in the future as it has been in the past, until some means shall be discovered of turning all, or nearly all, its components to commercial account.

The sum of the whole matter is, that timber is likely to get dearer and worse. Both its dearness and its badness will lessen the demand for it, so that the supply will not be exhausted so soon as statisticians anticipate. In the mean time, the architects of to-day, and their immediate successors, will have to think how to manage with less woodwork, and what to use in place of it. Artificial substitutes are sure to offer themselves. We shall get improved fibrous plaster, perhaps, in place of boards—fireproof and non-decaying. We shall get improved concrete, tougher, firmer, and more sightly—strengthened, probably, for ordinary work, not by rolled joists, as it usually has been hitherto, but rather by wires or threads of metal mixed up in its substance. Inventors are already looking in these directions, and when they can produce a material cheap enough and trustworthy enough, in many of its uses wood will be superseded. The result will be to employ more English labour, since we shall practically manufacture our timber here, instead of importing it from abroad.

Professor Kennedy took up a widely-different subject for his address to the Mechanical Science Section. He enlarged on the need for more thorough training as regards the engineering profession. Much that he said would apply, almost word for word, to the architectural one. "training," he said, jars on man in the present congested state of all sions. But the more competition there the more the training becomes a vital necessity, and the more hopeless is the case of those who are without it. The particular sort of training which Dr. Kennedy advocated on this occasion is critical training. It is just as necessary for us as for the engineers, and yet it hardly ever seems to have been set about in a methodical way. Every architect urgently wants it for his own use; every assessor in a competition wants it with tenfold urgency, for the benefit of others; and yet how few men have enough of it! For the criticism intended is not the mere power of writing and "cutting-up" one design, or of saying that another would be better if the author had taken more pains. It is the power of seeing what are the actual necessities, practical and artistic, of each separate case, and of showing how and why one design fulfils them better and another worse. We each need this power every time we make a plan, or an elevation, or a detail. There are endless ways of planning almost every building. It does not take much invention to strike out half-a-dozen different schemes, say, for a house. But when we have struck them out, there comes the vital point, which is to be selected, and why? To criticise other people's work seems easy and amusing; to criticise one's own work, especially when recently done, is difficult and often depressing, yet it is a thing that must be accomplished. And, seeing that the difference between a wise and an unwise judgment of one's own conceptions means the difference between success and failure in the works we build from them, no training would be too troublesome which would help us to judge aright. Self-criticism, of course, is a thing which every man who is not quite useless contrives to manage in a greater or less degree. But how to make it easy and accurate, how to teach it as other arts are taught, is a question which deserves earnest thought from everyone who is concerned in training the architects of the next generation.

THE HOLIDAYS.

THERE are several ways of spending one's holidays. If it means simply relaxation from the ordinary routine of professional work, then no doubt the best and most profitable holiday for mind and body is that of employing both in the contemplation and pursuit of the exact opposite of that which has been taxing them. The practical architect, according to this definition, would find it better to get right away from his business and surroundings—to forget all about buildings, drawings, and contracts; to go into the country, to the seaside, or to explore the Lakes or the Alps. The surveyor steeped in calculations, quantities, and valuations would find relaxation in those scenes and pursuits which gave play to his bodily recreation and imagination. He would forget all about cubings, squarings, fee-simples, and leaseholds and their value, and the draughtsman would for the nonce take to his bicycling or his boating. But there is another way of looking at the year's vacation. Many, and especially the younger members of the profession and the student, regard it as a holiday of recreation or of opportunity, and make the best of the time allotted to them in pursuing their favourite study of sketching and archæological research. They take a Continental tour to Belgium, or Holland, France or Italy, with the object of doing some sketching. They take to this mode of recreation because it affords a relaxation of those fibres of the mind and body which have been on the strain. The practical architect engaged in everyday business would find such a pursuit as much [illegible] as going simply for bodily rest, [illegible] more so. The Architectural Associa- [illegible] indulge in this kind of holiday, and [illegible]se of the members who care for work bring home a sketch-book full of pleasant reminiscences, or photographs of buildings visited. Few of the districts visited by the Association possess more architectural interest than that of Somersetshire. Wells itself is a mine of interest to the lover of architecture and archæology, to say nothing of the visits paid to such places as Croscombe, Chewton Mendip, Mells, Shepton Mallet, Evercreech, Longleat, Glastonbury. The towers of the Somersetshire churches are in themselves unique for the beauty of their proportions, the stateliness of their architecture, and the charm of their details. We have given illustrations of several of these remarkable structures. Compare those of St. Cuthbert's, Wells, Evercreech, and Axbridge, with their majestic belfry stages and their wealth of angle turrets. For simple grandeur of outline we know no western church-tower that surpasses the majesty of St. Cuthbert's, while for subtle stone-cutting and grouping the corner turrets of Evercreech tower are unequalled. The student will do well to note the way in which the old mason united the corner piers of his belfry story with the turret above the parapet; how he carried up his fine angle-set pinnacles, and made them cluster round the main body of the turret, thus insuring a graceful profile to the whole. We have nothing of the sort elsewhere in England in the shape of splitting up the angle buttresses and leading the eye straight to the summit, unless it is the "clusters" of St. Mary's at Oxford. For a study of pinnacle-clustering the Somersetshire churches present the student with the best English models. The intervening pinnacles between the belfry windows at all these churches, including Mells, is another feature to note. Tower development in England cannot be studied more profitably than in Norfolk or Somersetshire, for in each county we see distinct influences at work, giving shape and importance to this feature of church building. Again, for rich screens, pulpits, and roofs, both these counties present typical examples of Perpendicular and even Jacobean work.

Besides churches and domestic buildings, the young architect desiring to extend the knowledge of his profession can very well study building stones with a view to acquaint himself with many of those local peculiarities in building which are of such value, both practically and in understanding style. Visits to quarries and to buildings in which certain stones have been used afford one profitable way of spending a holiday. Cornwall, Somersetshire, Derbyshire, Northamptonshire, and Yorkshire are districts sufficiently distinctive and instructive in this way. Handbooks give but a very imperfect account of the geological formation of a given neighbourhood, as they are generally compilations. The architectural student wants to know something beyond the specification of strata, and even his Lyell or his Geikie may fail him in those practical questions of durability, porosity, colour and cost, and easy working, which are elements of the most practical value. It matters little to know that the Purbeck beds and Portland stone belong to the upper strata of the Jurassic series, or that this series contains four distinct formations of Oolitic limestones, of which the Bath oolite is one, or to know even the structure of certain stones; but it is a great deal more important to know that one has seen a given stone in a durable condition in a certain ancient building.

The use of building materials, and the modes in which they are converted in different districts, can only be obtained by personal visits to localities. For instance, various methods adopted in brick and stone wall-building may be usefully noted. So also as to the combined use of brick and stone which one finds in the West and Eastern counties. Jambs and window openings or reveals are seen set in brickwork in many parts, with stone as a filling-in of the walls—a mode of building which seems to admit of a wider application. Many different ways of forming arches, of covering roofs, are to be seen in the Western and Midland Counties, and even with regard to partitions and timber-framing, diversities in practice are to be met with. All these characteristic features of building are worth attention, and the wider the arcchitect's acquaintance with constructive methods and local uses, the better able is he to keep pace with and to design buildings in those localities.

RECENT ARCHITECTURE IN LONDON.

CONTEMPORARY STYLES.

WE are passing through a crisis of change and reconstruction. Demolition and rebuilding are in the air. In City thoroughfares which we have known from boyhood old features and landmarks of a past age are rapidly disappearing, and new buildings of greater height and architectural pretensions are taking their place. And it is extremely hard to keep pace with the progress that has been made in many localities which have been given up to the Metropolitan ædiles. Whether the pending changes in the Metropolitan Building Acts have made any difference to owners and promoters of new buildings we cannot positively say, though there has been probably no previous period when so much rebuilding has been accomplished in London. In no other city of the United Kingdom it may be safe to assert, can the observer of architectural development find the materials for writing a history of contemporary styles, for it is the only place where luxury and commerce, industrial and educational schemes can be found in combination, thus giving rise to varied problems of construction. The English Metropolis is also the gathering place of all nations, and, therefore, the various styles of the world have had here their fair opportunities for either development or decay. Dr. Billings, in a clever paper read before one of the sections of the British Association at Oxford, has suggested the question whether race may not be an element in determining the death rates of civilised countries, and he shows us that very remarkable differences of rate are observable in New York owing to nationality. May we not apply the same argument of hygienics in determining the rapid development of some styles, and the decline of others? We all know that the nationality of a style has had a great deal to do with its growth; that when we transplanted Greek and Italian to these shores, those exotic arts of the sunny shores of the Mediterranean and the blue skies of the Adriatic did not long survive the cloudy atmosphere of our large towns. On the other hand, we know that Gothic and the Renaissances of France, Germany, and the Netherlands have taken root, and have outlived their less hardy predecessors. We have proof of this in the particular phases of architecture seen in London.

It would be difficult to say which of these several varieties of European architecture have taken the firmest root. What we may generally designate as Flemish appears to have contested very strongly with our vernacular styles, such as our English Renaissance of the 17th century. Late Gothic and French Renaissance have also reasserted themselves in our public buildings and streets, and it would not be easy to say which of these styles has won general acceptance for secular and business purposes. The choice seems to lie between English and foreign Renaissance, and, on the whole, we may say the Italian element is less strong in it than it was a few years ago. Architects have discovered by a kind of natural selection those elements of style which have more affinity for this climate, and which can be converted most easily into our natural building materials. A process of elimination has rejected many features like flat roofs, useless balustrades and pediments, and other ornamental adjuncts which are unsuited to a Northern climate and smoky town atmospheres. Hence, we have a marked reappearance of Late Gothic and Early Renaissance forms, the latter with distinct Gothic admixture, noticed in many of our newly-erected buildings, in which mullioned windows and gables and pilasters are blended, and as we find in many of the old English houses and halls of the 16th century, when Italian features were being introduced into Gothic buildings. A more distinctive designation for this style would be "Italianised Gothic," generally called Early Renaissance, of which we have several recent examples in the City and West End thoroughfares. One valuable point is its adaptability to modern building requirements. The window apertures can be made large and square-headed without the weakening effect of large glass openings. The mullioned window in its later 16th-century form is as well adapted for business premises as any other form, and indeed better, for it can be extended to the whole width of a front, if need be. A good instance of a building for business purposes in the City, designed on this principle, is the Metropolitan Life Assurance Offices, Moorgate-street, by Messrs. Aston Webb and E. Ingress Bell, where the main windows on both fronts are mullioned, and occupy the largest portion of the wall; the main piers are reduced to mullions, and each window is also divided into two lights by a mullion. The style, notably the corner, is essentially Gothic, rather Spanish in character, with details of a mixed or Italian type. It is of stone, with Cornish granite basement. The public offices and board-rooms are lighted wholly by the mullion and aperture system. No Classical or Italian method could give up so much wall-space to light openings. The Roman, Florentine, and Venetian styles of the Cinque Cento period have all been tried in London; but in these phases of the Italian Renaissance the windows have been mainly round-arched, and scarcely suitable to commercial or business purposes. One of the latest of the buildings in the City is Mr. Belcher's Institute of Chartered Accountants, Moorgate-street, which we lately illustrated (Jan. 26th and May 4th last). It is a clever adaptation of the Italian. Preserving dignity and regularity in the main horizontal lines, a rusticated treatment of the basement piers, with a columnar order in the upper or second story, it has yet a pleasing variety in the rich detail, almost Greek in refinement and restraint, and in the well-sculptured frieze between the first and second-floor windows. In the points of interest a certain richness is focussed. The lower offices are well lighted by wide windows between rusticated shafts of the Tuscan order. Florentine severity, Roman strength, and Venetian richness are blended in an agreeable gradation from the base upwards.

What is to be said of the street upon street of new buildings? They belong to various types of so-called Renaissance, a poor, thin, emasculated sort of design, in which pilasters, broken gables, and other ornamental features are found, and of which we have specimens in Oxford-street, the Strand, Arundel and Surrey-streets. Some of these exemplify what we have before termed the "pier and bay" style; that is, a succession of brick piers with bay-windows carried up between, but of no particular character, either Gothic or Italian. The whole front looks thin and superficial; the pilasters are skin-deep, and the bays are flattened or recessed. The large flat surfaces of brick are divided or covered over by strips of pilasters, full of unrestful notches, and painfully lacking solidity. Statutory building rules have, to some extent, created this feature, but not altogether. Hyde Park Mansions is a building of this character. The alternate pier and bay is a mode of building which has advantages; it gives wide windows, and some character can be obtained. We lately illustrated a large corner residential block at the corner of Cavendish-square, of red brick and stone, in which this method has been carried out, and the same may be seen in some red brick buildings in Surrey-street. This style soon becomes monotonous. Terracotta has introduced us to a somewhat florid French and Italian Renaissance in many new buildings. In Surrey and Arundel-streets, Strand, may be noticed a rebuilding of those narrow streets leading to the Embankment. We may particularly notice the new blocks of red brick and terracotta chambers and offices in Arundel-street, "Effingham House" and "Granville House," and W. H. Smith and Sons' new premises, good examples of terracotta work, though undoubtedly too pretentious for narrow streets. Norfolk Hotel, in Surrey-street, is a design in a rich Renaissance style, with a boldly-projecting bay window, which, by the way, comes out beyond the building line of the new adjacent fronts. These examples of brick and terracotta are representative of a good deal of our modern street architecture, a kind of mixed Italian and François Premier style; they are interesting as showing how decisively the more flexible features, like mullioned and bay windows, porches, corbelled bays, and balconies, &c., which were designed for stone buildings, are being reproduced in terracotta. Dutch or Flemish characteristics appear to retain their hold. The style is more easily adopted than the last for small and narrow house fronts, as we see in a narrow front, Swan Chambers, E.C., and in a large gabled house, 141, Fenchurch-street. There is another development of Classic that we cannot overlook. We have referred to what may be called "Italianised Gothic," and we now draw attention to an English version of Roman or Palladian which has been largely used of late, to which we give the name of "Anglicised-Roman" or Italian—a style which generally passes under the name of "Georgian," and which was practised in the 18th century. This style affects red brick as well as stone, and we have had lately several good examples in London and the suburbs. Engaged columns or pilasters, often with rustications, are generally found in one or two stories, with square or round arched window openings. Nearly opposite Newcastle-street in the Strand a large block of shops and offices has been erected in this style, of red brick and stone dressings. There are two orders of engaged columns to the main stories, and the treatment is free and rusticated. Of Late Gothicesque we have evidence that even for secular purposes it has not been played out. In Tottenham Court-road new premises for the blind have been erected, a view of which we gave lately. It is a corner building with a corbelled octagonal turret at the corner, and with mullioned windows and stepped gables. In Drury-lane the new building not yet completed for library and reading-room for St. Mary-le-Strand is a notable addition in a Late Gothic style, though a little heavy in the detail. An extensive demolition of houses is going on between Catherine-street and Drury-lane, in the midst of which the old churchyard described by Dickens in "Bleak House," and known as "Joe's churchyard," access to which is obtained by a passage from Russell-court, may still be seen.

The changes in style of our recent buildings have been brought about by the actual requirements of construction, of light and air, and also of the materials. The requirements of light and air in our street buildings have very materially helped to formulate a style. A gradual lessening of the area of walls and supports has led to a lighter treatment, and have developed the pier and window mode of building. Nor can we dispute the influence of iron in construction in reducing the number of points of support. The struggle just now going on is between the "wall" and the "pier" modes. Once the wall assumed its pre-eminence, and the openings were few and small. Little by little the window has been encroaching on the wall area till we have cases in which the latter is reduced simply to piers, and this process is likely to go on by the substitution of materials like iron and terracotta for brickwork and masonry; but true architecture will never give up the contest in maintaining a due proportion between solid and void, and those traditional forms which distinguish a building from a mere skeleton or framework.

"OLD MASTERS" ON THE CONTINENT.—VIII.

By Charles L. Eastlake

(Keeper and Secretary of the National Gallery).

In a former number of the Building News was described a portion of the fresco painted by Benozzo Gozzoli, on the right-hand wall of the Riccardi Palace Chapel. The present article is accompanied by an illustration of the remaining portion, and contains a brief account of those frescoes which, while forming part of the whole series, are executed on other walls of the room.

It has been mentioned that the Chapel is lighted by a single window, placed at the end of a rectangular recess nearly opposite the entrance. The right-hand wall of this recess is occupied by a group of angels somewhat less than life-size, all having variegated wings. Those on the left of the foreground, draped in robes of pale rose, blue-green, and maize colour, kneel in adoration, while on the right of the picture, and more to the rear, appears a group of standing angels, similarly attired. In the background is a garden, with buildings in the middle distance, and a mountainous landscape beyond. Tall trees rise from this garden towards the upper part of the picture, where a flight of angels is seen in the sky.

The first thing which occurs to one on seeing this fresco is its wonderful preservation. The draperies, though somewhat mannered in parts, are dexterously handled, well lighted, and arranged with great taste. Many of the heads are of a beautiful type, and a few of them are foreshortened with remarkable skill. The flesh tones are fair and delicate, and the facial contours modelled with scarcely any shadow. A quiet dignity distinguishes both the pose and expression of these figures, which are well proportioned and full of saintly grace.

Scarcely less care has been bestowed upon the accessories of the picture—the red and white roses in the garden, the character of the tree foliage, the grass-plots, hedge-rows, and distant buildings, which the painter has drawn with a scrupulous regard for perspective, though his rocks are of a somewhat conventional type.

On the opposite wall, the kneeling angels are grouped on the right-hand of the composition, while the standing ones appear on the left. Here also we find a garden, or rather a shrubbery, inclosed by a latticed railing, with lofty poplars, &c., whose foliage, as in the companion fresco, is reserved for the upper portion of the picture, so that the hilly background may be disclosed, while the deep blue sky above is relieved by white clouds.

The draperies which clothe the heavenly host are handled here with equal skill, and present a chromatic scheme even more attractive than that on the opposite work. Great physical beauty is realised in some of the heads, especially that of one of the angels with crisp fair hair, who kneels on the right of the foreground, clad in a rose-coloured robe effectively painted with pale yellow lights. The foreground is enlivened by a pond with waterfowl on its surface, while goldfinches and other birds are perched on the rocky banks.

At the opposite end of the chapel, and on the right of the entrance, the wall is occupied by a portion of the Procession.* Conspicuous in this group is one of the kings magnificently attired in a green robe richly diapered with a large gold pattern, and trimmed with brown fur. He wears a large crown on his head, and is mounted on a white horse, preceded by three retainers and followed by others. Some of the heads are admirably drawn. The costumes include green tunics with sleeves of blue or plum-coloured brocade, hose of finely-toned crimson and *stivali* of yellow or scarlet leather. Some of the retinue wear picturesque caps, others are bareheaded; but long hair is for the most part worn only by the persons of distinction. In the background is a most elaborate landscape, which may almost be described as a bird's-eye view. It represents a hilly country divided into meadows or plantations, and intersected by hedges, with the distant view of a winding river crossed by a bridge, and a town perched on the summit of a wooded hill.

The fresco on the left wall of the chapel is very interesting. In the foreground is represented one of the Magi—an aged man with a venerable white beard, who rides on a mule. Further to the right, mounted on a black horse, and with his back to the spectator, is a young man clad in a tunic of crimson and gold brocade. Near him a lad, handsomely attired, bestrides a prancing steed of chestnut brown, and still further to the right we come upon a crowded group of retainers, whose heads are presented in endless variety of pose, some in full face, some half turned aside, others in profile—all ingeniously diversified in form, features, and expression.

In the background to the right a road winds round a rocky hill. Along this road we see a calvacade passing—horses, mules, and camels, some heavily laden, some bestridden, and others led by servitors. All these figures, being in the distance, are, of course, represented on a smaller scale. Falcons, feline hunting beasts, with other picturesque animals and objects, enliven the foreground.

Returning to the wall on the right hand of the chapel, we find the group selected for reproduction with this article, and forming, in fact, a portion of the largest fresco, half of which was described and illustrated in a previous number of the Building News.

On the left of the composition is a crowd of mounted Orientals, riding—so to speak—right into the foreground, where the horses are most dexterously foreshortened. Most of the men wear a red *berrette*, the shape of which closely resembles a modern Turkish fez. The foremost rider, having turned the corner, is seen in profile. He is preceded by a negro, who walks on foot, clad in a short green tunic, and hose of different colours (white and green). Behind the horsemen appears a throng of figures, whose heads rise one above another, without any apparent violation of perspective. Indeed, if we suppose the procession to be coming down a hill, this pictorial arrangement is perfectly legitimate. The individuality and character of these faces, and the vitality of expression with which their features are invested, leave little doubt that they were all studied from life. In this respect, as well as in the masterly drawing, ingenious composition, and elaborate details of the whole work, the genius and skill of Benozzo Gozzoli are fully manifest.

---

* A portion of the Procession of the Magi, as well as the two Angelic groups (known as "Il Paradiso"), described in this article, will be illustrated in early numbers of the Building News.

"BUILDING NEWS" DESIGNING CLUB.

A VILLAGE CLUB AND COCOA TAVERN.

THE chosen designs for this subject have been waiting to be published longer than we intended, on account of the pressure on our illustration space, and we give them to-day, which is the first opportunity which has been available for their insertion. "Boomerang" is the author of the decidedly best plan. "Ant" we place second, and "Nitor" third. The conditions which we printed for the instruction of competitors were as follows:—

"A Cocoa Tavern and Village Club.—This building is to be built in a street, and set back with a paved forecourt 12ft. deep from the line of frontage and level with the footway, which is to be divided off from the forecourt by posts and chains. The width of the site is 60ft., and out of this a way to the back premises of the new buildings is to be provided, 6ft. wide. The central portion of the main façade may be carried up as a second floor, but the chief part of the building is to be on two floors only. The basement will provide space for a coal store and cellarage, &c. The accommodation is to comprise a coffee tavern for the use of the public as well as by members of the club, so that a public bar must be provided for a few customers, with a small smoking-room adjacent to it. The club entrance must be distinct, and its bar must be private on the other side of the tavern, but worked by the same staff. On the ground floor a club smoking-room, news-room, and writing-room must be provided, of about 500ft. super. each for the two latter, and 400ft. for the former. Upstairs a billiard-room, large enough for two tables, is to be contrived. Over the tavern a small residence for the landlord is to be located, with one sitting-room and three bedrooms at least. The kitchen and offices on the ground floor will be large enough to supply the requirements of the whole undertaking. A lavatory, &c., will be necessary for the club, and a small convenience is to be furnished for the public use in connection with the tavern. The depth of the site is considerable; but it will be laid out as a club garden, and the depth of the buildings must not be greater than is absolutely necessary. A projecting sign of the 'Apple Tree' is suggested. Style to be suitable for a stone district, with green slate roofs. Scale 8ft. to the inch, $\frac{1}{16}$th of an inch to the foot for plans. A view to be furnished."

The somewhat mixed character of the trade to be arranged for in this building, in which chance customers are to be provided with light refreshments as well as the members of the club, domiciled under the same roof, no doubt increased the difficulty of producing a satisfactory and otherwise simple plan. The relative importance of the two entrances seems, too, to have been a point over which several of the competitors have failed entirely, and even "Nitor," who receives the third place, has put the public doorway out of sight round the corner, in the open passage way leading to the yards in the rear of the buildings. "Boomerang" certainly has produced a very pretty and suitable façade to his "Apple Tree" Club and Tavern, recalling some old village buildings which we have seen about England—say, for instance, in Northamptonshire or in Rutland. The house bespeaks fairly well its purpose, and the effect is obtained without any loss to the internal arrangements, and without unnecessary ornamentation. Whatever faults there are in the planning do not come of sacrificing convenience to external appearance. The failings in the plan exist more to the centre of the building, chiefly in respect to the rather dark service-passage between the hall and the public smoking-room, and we do not think the kitchen is improved by the upper part of the landlord's private staircase projecting into it, materially reducing thereby its cubic space of air. The bars are better contrived than in most of the designs; but the service space need not have been broken up by the wall between the two halves. An arched opening would have left the servers more free, and screens after the fashion of those now used in good taverns would have sufficiently divided off the bar customers in the two departments, which, of course, would in any case be separated by the divisional wall extending, as at present, from the front wall to the inner line of counter. The other arrangements speak clearly enough for themselves, and the wrought-iron sign with the gilt apples is eminently adapted to its purpose. "Ant" makes a bar in the middle of his club ground floor, and lights it from an internal area between the staircase and his kitchen. The public bar is so situated with regard to the club bar that, when the door between the two is open, a full view all along the counter is obtained, and none but fixed screens would very well prevent this, and they are objectionable arrangements in a bar, interfering with effective management. The two entrances are sufficiently distinct and obvious. The landlord's sitting-room overlooks the main street, which is an advantage not secured by "Boomerang." Architecturally, we cannot say that "Ant" has been so successful as might be wished. The fenestration adopted is carelessly managed, without much regard to the value of plain faces of walling, and the composition lacks proportion and "go." There is an absence of concentration, the whole front of the little building being too broken up to be effective. "Nitor," the third man, is much better in this respect, and, besides, his drawings are more crisp and spirited; but his plan left us no choice, for we could not ignore its serious shortcomings. The public entrance round the corner, out of view of the passers-by, leads to a cramped and badly contrived bar, with a quadrant counter in the corner, just in the way of anyone wishing to enter the smoking-room beyond the inclosed settle next the fireplace. The club bar is scarcely any better, and, speaking generally, the plans are wasteful in the manner in which the available space is utilised, with dark passages leading from one part to the other. The sign is pretty, like the building, which has a good elevation towards the garden at the rear. "How's This?" is hardly happy in the way in which he has treated the two entrances—indeed, the club doorway looks the less important of the two, while the public would evidently need some specific instructions to insure the right use of the approaches to the building. The plan has many good points, with a convenient administrative department, and capital club-rooms both upstairs as well as down. The elevation is rather commonplace, though in execution no one could call it pretentious or vulgar. "Kelso" has failed to give us an hospitable-looking building, for the group externally bespeaks more the idea of a police-station with a small court-house attached. The service of a coffee-tavern, too, is not provided for adequately by such small counters as those in both his bars, which seem better adapted to the sale of drams than tea and other similar refreshments which require ample room for urns and pots, cups and saucers. The w.c. opening out of the public tavern entrance is an ill-considered contrivance enough to condemn any plan, as "Kelso" must very well know, and with all his advantages of draughtsmanship he ought to do better. His ideas seem so cramped, that ingenious as his plans sometimes are, his provisions would at best be but very restricted when realised in bricks and mortar. "Blackheathen" seems to be fired by a burning desire to make a striking-looking façade at all costs, with a quasi-tower in the middle of its length, finished off in half-timber, and inclosing four bed-chambers for the housekeeper. On plan, however, this ambitious performance grows out of nothing in a natural manner, coming as it does over one-half of the billiard-room. We cannot praise the internal arrangements of the building, which does not do its author justice, unless we over-estimated his capabilities when he first joined the ranks of our Designing Club. "Diomed" deserves a degree of praise for the simple methods which he has adopted in working out the details of his design. His plan also is really better than would appear at first sight, and in execution the building might look well, and prove convenient; but its merit, which we thus amply recognise, does not allow of "Diomed" taking a higher place in the list than that which we have assigned to him. "Cyclist" has overdone his design, making it restless and ineffective. The drawings are poor, too, and so is the plan. "Claire," likewise, fails in the same way, but at least he is not vulgar. The porch looks, however, as if it belonged to an old mansion once upon a time, and had been rebuilt by someone who did not know anything about the art of architecture. "Youngster" needs time to improve, for which there is ample occasion, though he has done well to try. Let him repeat the attempt. "Dessinateur" comes next, and "Vulgar Terror," who ranks last, rightly appraises the design which his motto describes so correctly.

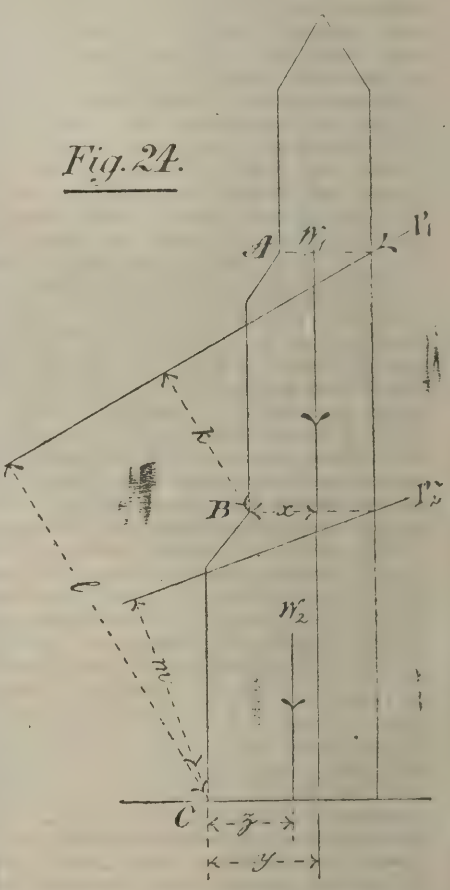
THE THRUSTS ON WALLS AND ARCHES.*—VIII.

By G. A. T. Middleton.

BUTTRESSES.

IN considering the question of buttresses, it is only necessary to depend upon principles already fully enunciated. The thrusts to which they are subjected once determined, the overturning power which they possess is readily measured by taking moments, just as is done in the case of walls, about their outer edges—and, to obviate overturning, this power or tendency must be at least equated or exceeded by the power of the buttress itself, measured by the moment of its weight about the same outer edge, to resist this overturning. Thus, no special difficulties are presented.

Fig. 24.



To take one special case, the ordinary one shown in Fig. 24 should be quite sufficient to explain all that is necessary. P_1 is supposed to be the ascertained thrust from an arched flying-buttress, and P_2 to be that from the principal of an aisle roof. Of course, at the point A there is no overturning tendency. The weight of the pinnacle above this point, which pinnacle may be as ornate as may be desired so long as it be heavy enough to do its work, is only needed as part of the weight of the buttress above B, acting as W_1 collected at its centre of gravity, with the leverage x to counterbalance the thrust P_1 acting with the leverage K. Thus, taking moments about B_1—

$$W_1 \times x \text{ must be greater than } P_1 \times K.$$

Similarly, supposing W_2 to be the weight of the portion of the butresses lying between B and C, and to be located at its centre of gravity, then the moment of overturning about the point C becomes—

---

* All rights reserved.

$$P_1 \times l + P_2 \times m,$$

and the moment of stability about the same point is—

$$W_1 \times y + W_2 \times z.$$

Again, the moment of stability must, at least, equal, and should exceed, the moment of overturning, and, as explained in an earlier article of this series, to secure safety the points B and C, around which moments are to be taken, should be fixed at one-third of the thickness of the buttress from its outer edge.

It will readily be seen that, by trial, the problem can equally well be solved diagrammatically, as shown in Fig. 25.

P_1 and W_1 are combined where they meet, and their resultant R_1 found. Then this is combined with W_2, and a fresh resultant R_2 found, which is again combined with P_2, and a third resultant R_3 found. Then R_1 must pass within the joint at B, as against overturning, or within its centre third as for safety, and similarly R_3 must pass within the joint at C as against overturning, and within its centre third for safety.

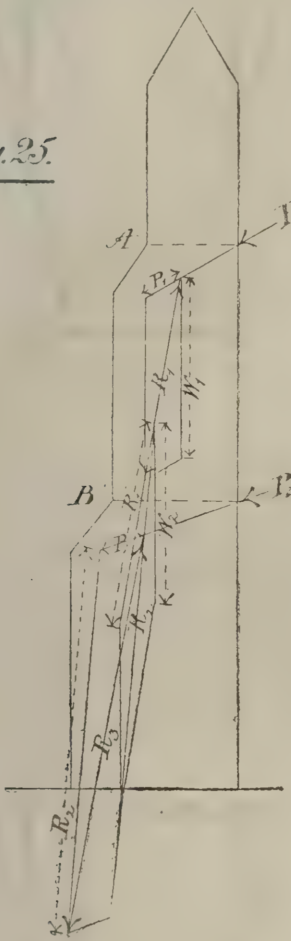


Fig. 25.

THEATRES.—XLI.

By Ernest A. E. Woodrow, A.R.I.B.A.

The foyers, crush-rooms, saloons, and refreshment-rooms play an important part in theatre planning, especially in opera-houses, where there are long intervals between the acts, and where the saloon is much frequented. In this class of theatre the foyer is usually a large and imposing apartment, and not infrequently we find it consists of a suite of rooms. For dramatic theatres, the saloon is generally combined with the refreshment-room and smoking rooms.

The saloon is also used in many theatres for the holding of public meetings in connection with "the profession," social receptions, and similar functions. In this part of the house, when there are any, are placed the art treasures of the theatre—portraits and busts of noted actors and actresses. This combination of reception-saloon and art-gallery, refreshment-room and promenade, must all be borne in mind by the architect.

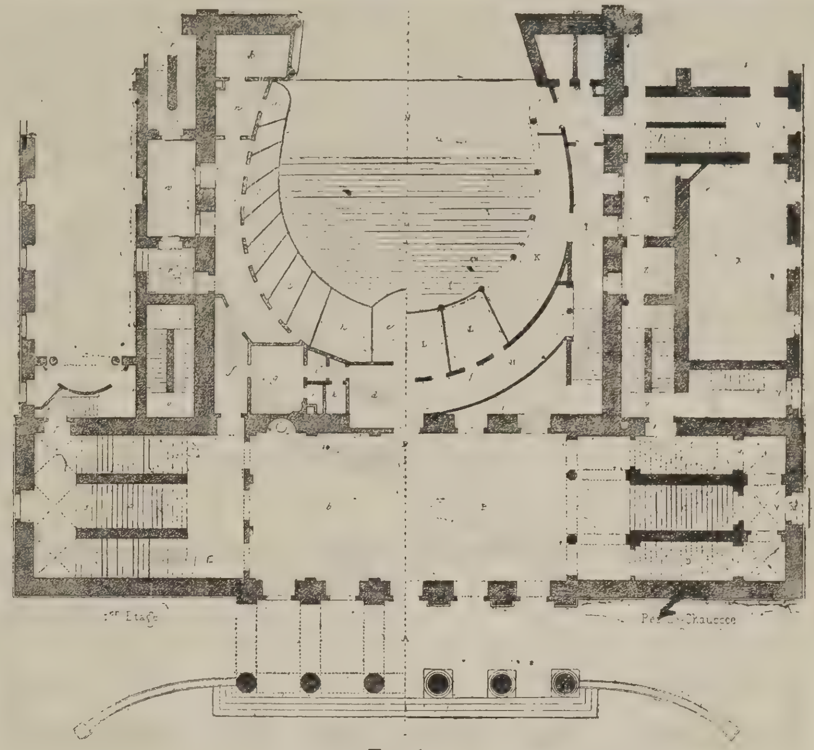

Fig. 1.

The saloon affords an opportunity for some architectural treatment of a dignified and imposing nature. In Continental theatres, both old and new, such treatment is always to be found to a more or less degree. From M. Constant's work I have selected some plans of the older Continental theatres, which have not been illustrated before in these articles, showing the position of the foyers in relation to the auditorium.

In Fig. 1, of the Darmstadt theatre, it will be seen that the foyer is planned in connection with the grand staircase entrance, and partakes also of the nature of a crush room. The same may be said of the Alexandre Theatre, St. Petersburg, as shown in Fig. 2. Figs. 3 and 4, the one of the Marseilles theatre and the other of the Opera Comique, Paris, are planned somewhat on the same lines.

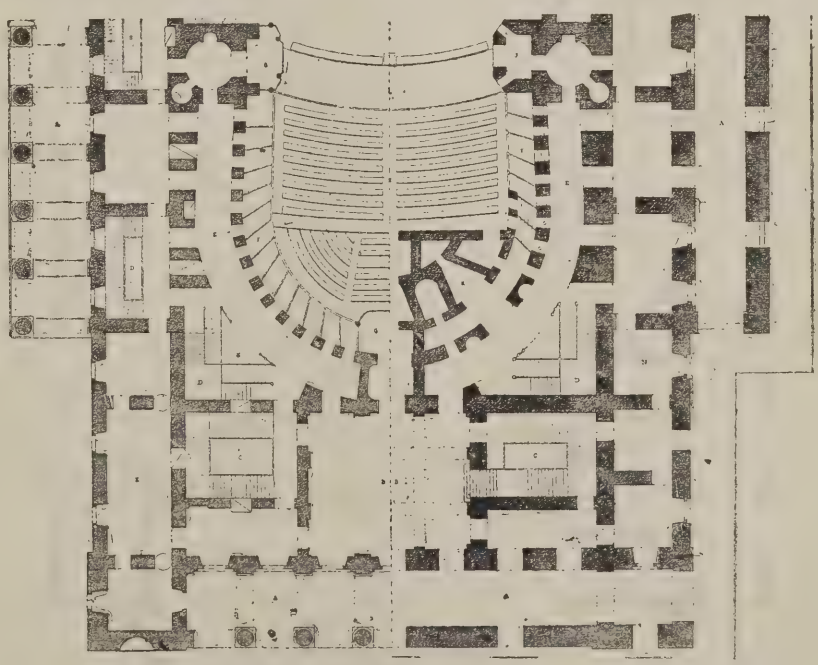

Fig. 2.

In Fig. 5, of the Theatre Royal, Madrid, a building erected between 1818-1850, the foyers are situated at the side, as shown by A in the plan, which is taken from M. Gosset's work on theatres. At the back of this theatre the plan shows a ballroom, entered from the foyers on either side. A favourite position for the saloon is over the main entrance vestibule, as it is placed in our own opera houses of Covent Garden (Fig. 6) and in Drury Lane Theatre (Fig. 7). Here, too, the foyer partakes of the character of a refreshment saloon, and is fitted up with a bar counter.

Fig. 8, of the theatre at Reims, is taken from the work of M. Gosset, the architect to the building which was erected 1866-1873. The foyer here is also situated over the vestibule. As I have used our own Theatre Royal as an example of the situation and planning of the part of theatre we are now considering, an extract from a monograph by the architect to the building may be of interest to my readers.

In Mr. Benjamin Wyatt's description of his design for Drury Lane Theatre, published in 1813, occur what now reads to us a rather curious description of his reasons for planning the front part of the building as he did, with the foyer on

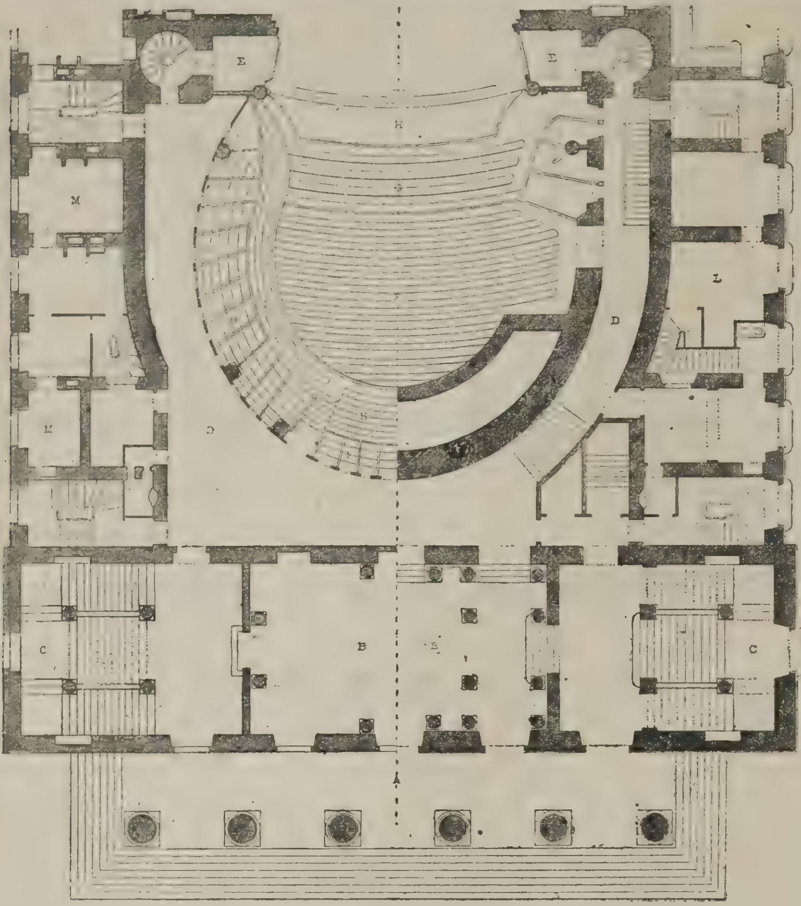

FIG. 3.

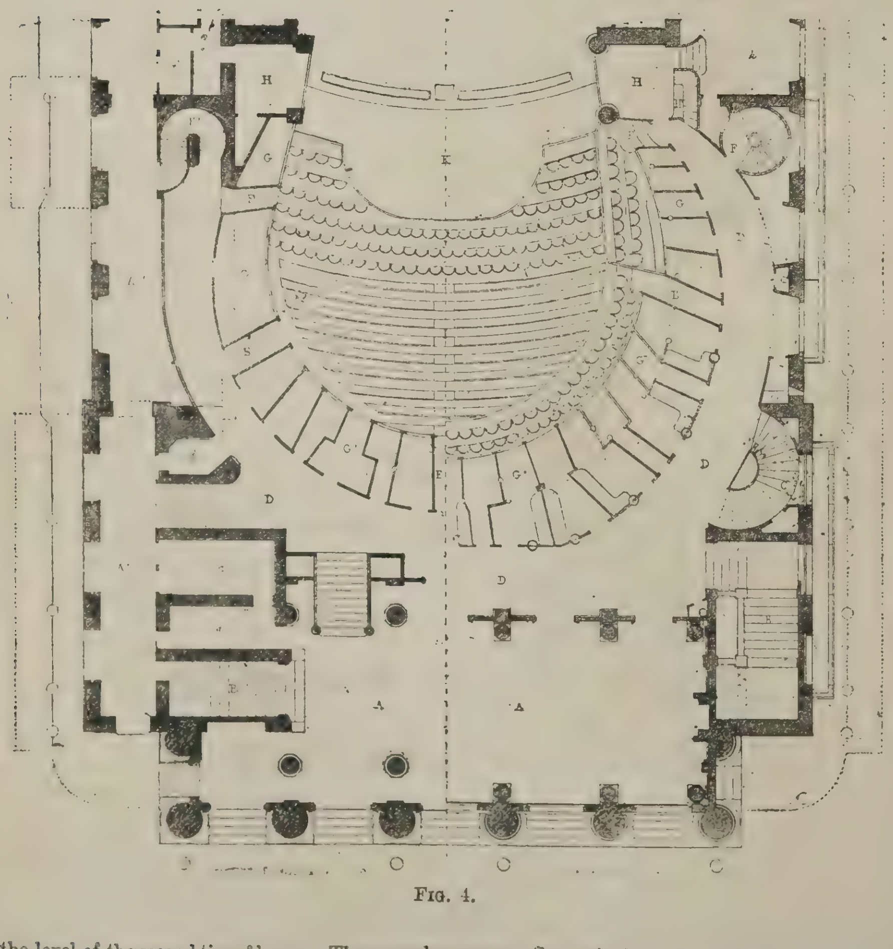

FIG. 4.

the level of the second tier of boxes. The remarks convey to the reader some idea of the change that has come over the conduct and class of theatre-goers who frequent our national theatre.

"When first I undertook the design for Drury Lane Theatre, I did it with an impression that among the principal objects which called for reform in the theatres in London, no one appears to be more important than that of protecting the more rational and respectable class of spectators from those nuisances to which they have long been exposed, by being obliged to pass through lobbies, rooms, and avenues crowded with the most disreputable members of the community, and subject to scenes of the most disgusting indecency.

"The general principle upon which I proposed to remedy this great evil was by arranging one part of the house in such a manner as to afford adequate accommodation for the more rational and respectable spectators without being at all suited to the reception of those classes which it is desirable to exclude from that part of the house; while as an additional security against their intrusion where they were not intended to go, I at the same time provided for them in another situation that sort of accommodation which, by alluring them to those parts of the house intended for their reception, would effectually withdraw them from the division appropriated to the more respectable class of the spectators.

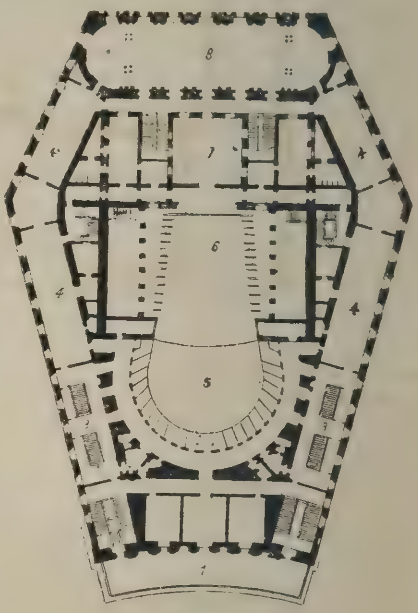

FIG. 5.

"I felt that an avowed exclusion of any particular class of people from either part of the house (except the private boxes) would be utterly impracticable, and therefore that the best plan was to form an arrangement which should virtually amount to an exclusion of those whom it was desirable to exclude, without any declared intention of so doing.

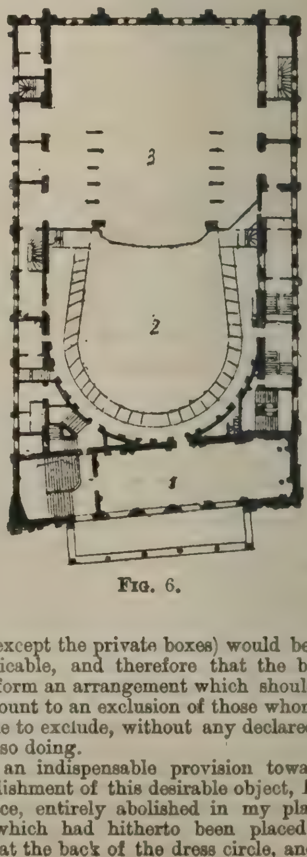

FIG. 6.

"As an indispensable provision towards the accomplishment of this desirable object, I, in the first place, entirely abolished in my plan those boxes which had hitherto been placed immediately at the back of the dress circle, and which

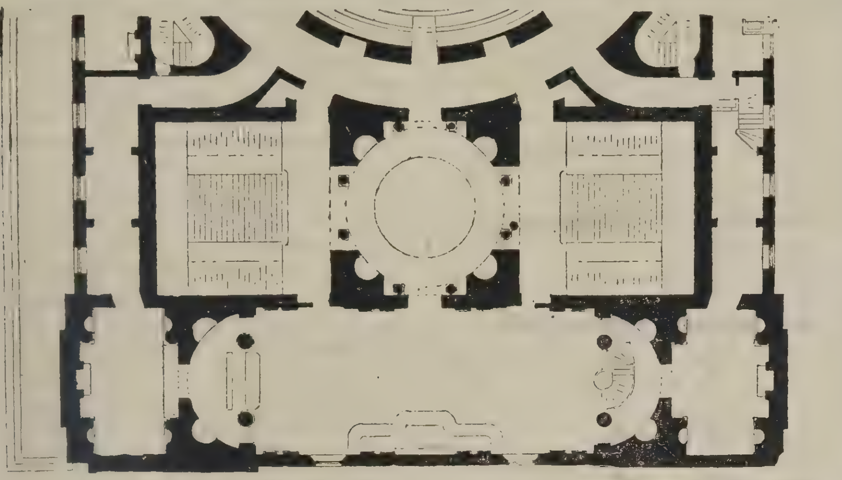

Fig. 7.

are vulgarly called the 'Basket boxes.' It is very well known to everyone who has been in the habit of frequenting the theatres that the women of the town never hire or attempt to appear in what are called the *Dress Boxes*, and that the ladies who do occupy those boxes may be enabled to go to the play with great comfort and security if relieved from the nuisances to which they have hitherto been liable in passing to and from their boxes.

"The *Basket*, therefore, being abolished, and no lobbies, coffee-rooms, or other appendage of that description being placed contiguous to the dress circle, nor within a considerable distance from it, I calculated that the women of the town and all the most disorderly spectators must find that part of the house so ill-adapted to their convenience, that they were totally deserted, and naturally resort to whatever part of the house should furnish the accommodation which they require.

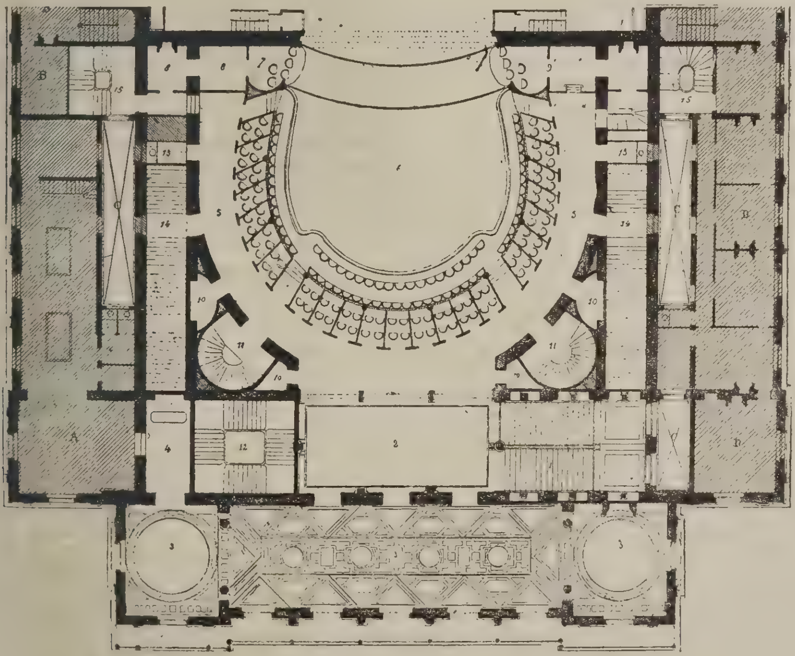

Fig. 8.

"The same considerations to which I have adverted as a reason for refraining from an avowed exclusion of any particular class of the community must, of course, operate against appropriating to the exclusive use of this circle of boxes a separate entrance and staircase. According to my plan, those persons going to the dress boxes, enter the house at the same doors and same staircases to a certain height as those going to any of the boxes above; but having passed the first flight of the staircases they then enter the corridor appertaining to the circle of the dress boxes, and are immediately and completely separated from the rest of the house, and not at all liable to any molestation, there being no lobby, coffee-room, or lounging place of any description to lead to this part of the house any of those persons who would be a nuisance in it.

"According to the above principles I not only provided a ready access to the dress boxes and refrained from placing near to them any lobby or room which might serve as a receptacle for persons who could not have seats in those boxes, but upon the next floor I provided a spacious and handsome suite of rooms for the purpose of attracting all those whom it is desirable to remove from below the stairs and of keeping them entirely out of the way of the more respectable part of the company. I endeavour to make the handsome effect of this floor sufficiently pleasing and attractive to divert the minds of those who were intended to occupy it from any idea of their being excluded from that part of the house which they might otherwise have considered as the best, and at the same time not to give them the exclusive advantage of the handsome effect so produced; but by opening a view of the staircases and other parts from the ground floor to give to all those who should ascend no higher than the dress boxes a *coup d'œil* of the most striking part of the interior.

"It was my full persuasion, in arranging this part of my plan, that if as many persons of all ranks as the house should be capable of containing were to be admitted with free liberty to go to whatever part of the house they might prefer, the whole of that class which I proposed virtually to exclude from the dress-boxes would, of their own accord and in preference, resort to the suite of rooms which I had placed upon the second floor, and that the preference so given by them to that part of the house must infallibly enable the more respectable persons going to the dress boxes to pass in and out of the house without the smallest chance of annoyance, and to sit in their boxes exempt from all those nuisances to which they had in other theatres been very frequently liable from the number of disorderly persons who were led to that part of the house in consequence of the basket boxes and other appurtenances of that floor."

This extract, although somewhat lengthy, gives such quaint reasons for the form of plan adopted, that it must be of interest to the architect of the present day to follow the thoughts that guided the architect of 80 years ago in his design.

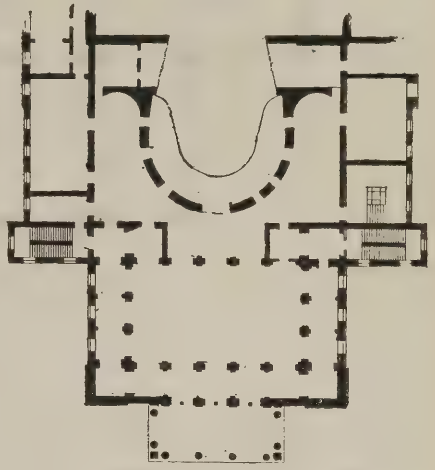

Fig. 9.

Of the more modern Continental theatre, Figs. 9 and 10 give the saloon as designed in the reconstruction of the Schwerin Theatre by Mr. Danich, the architect. Here the saloon is also constructed to act as a concert-room and grand reception hall, and can be used apart from the theatre. The plans show smaller foyers and refreshment-rooms at the sides of the auditorium. Fig. 11 of a part of the new Rotterdam Theatre, by Mr. Verheul, shows the foyer as a suite of three rooms. For this diagram, and those of Schwerin Theatre, I am indebted to Mr. Edwin O. Sachs, who received them from the architects. Had space permitted, I should have included the foyers of the larger Opera Houses, such as Paris and Vienna; but I have produced portions of these plans in other articles of this series. Several other of the smaller Continental theatres should also find a place in this article; but I have one other point to dwell upon before dismissing the subject.

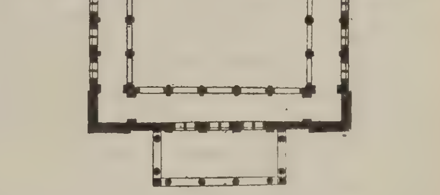

Fig. 10.

Where refreshment-rooms are situated at a higher level than the street, it is necessary to convey by some means the casks, barrels, and boxes to the saloons. In some cases beer cellars are formed as in a public-house, and the beer pumped up; but in others the barrels are brought up the staircases used by the public, with the

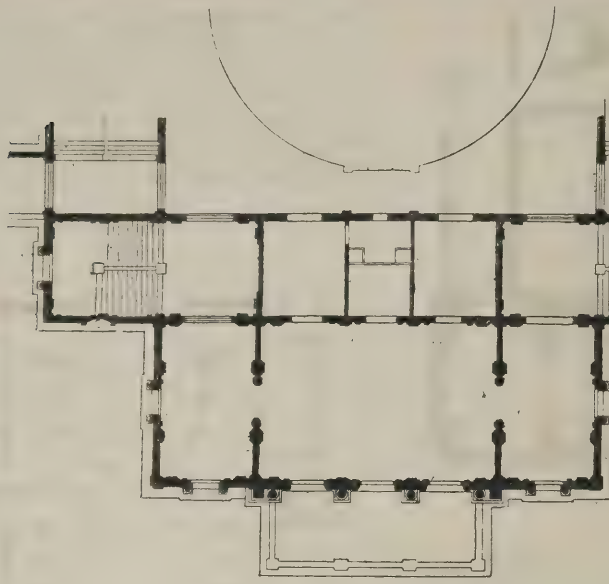

FIG. 11.

consequence that the nosings are chipped off, frequently making the stairs in a most dangerous condition. It is better, therefore, to set aside, among other rooms in the basement, one for a beer and spirit store, with an entrance to it by a "rolling way" from the pavement. This cellar could be connected with the refreshment-rooms above by pumps, and a lift to take up boxes of mineral waters and bottles of wine, &c. This lift, which, in accordance with modern requirements, should be inclosed with brickwork on all sides, it is true, would make a connecting flue from floor to floor for the conveyance of smoke and fire from room to room.

An invention has lately been patented for the horizontal and automatic closing of lift openings at each level, in order to localise fire and smoke to a limited area in any part of the building, so that it can be coped with and overcome before spreading.

The openings to the well-hole at each of the floor levels are closed, by this invention, by self-closing horizontal iron sliding doors. Where, however, the projection of a girder or the presence of a wall prevents the doors sliding, they are made to rise like cellar flaps. These doors are opened by the action of the lift ascending, and closed by it descending, or can be worked by hand power from any floor or level in the building. The patent is called "Hallenstein's fire-doors." I should add that this description is only given after seeing a model, and that I cannot tell how it would actually work. The principle, however, appears a good one, and it is undoubtedly desirable to stop the up-draught in the flue created by the well-hole of a lift. It is the danger of such a strong and certain conveyance of smoke that has excluded lifts to some extent in theatres. They may, however, be considered necessary in connection with the commissariat of a theatre. Lifts, too, are of very great service in the dressing-room block of a theatre, saving actors the tiring trudge up many stairs each time a costume has to be changed, thereby taking away much of the natural energy required to be thrown into the action of the part.

* * *

NOTES FROM PARIS.

FRANCE has just lost another eminent sculptor in the person of Auguste Cain, whose death, following so closely on that of the celebrated sculptor Barye, throws additional mourning over the circle of Parisian artists, and leaves another large gap in the number of French sculptors. Auguste Cain, a sculptor of animal groups, was one of the most remarkable of the pupils of the late Barye, and son-in-law of the well-known sculptor Mené. Cain at an early age commenced work in the workshop of a joiner, but giving way to the inborn instinct of art, and following the bent of his young imagination, he entered the studio of the sculptor Rude, and later on studied under the late sculptor of animals, Barye. His first successful attempt was a small bronze exhibited at the Salon of 1846. Two years later he attacked the first series of the work which brought him fame, and produced the well-known group of the "Frogs asking for a King." From this moment his maturing talent asserted itself, and the several groups of animals, which have rendered the artist's name celebrated and placed him on a footing with the great Barye, were produced. After many successes at the Salons and Expositions he was decorated in 1878. Amongst his finest and best known works are the "Vulture and Fox," the "Tiger and Crocodile" (this last group earning for the artist the Legion of Honour), the "Lions Quarrelling over a Boar," and the "Family of Tigers" (his *chef d'œuvre*). The gardens of the Louvre and the Luxembourg are decorated with these groups, and with many others by the same sculptor; the Lions of the Paris Hotel de Ville are by Cain. Although notably a sculptor of animal life, this artist has left behind him many examples of decorative and monumental art. The late artist died at the age of seventy-two, leaving two sons, both painters of talent.

Architectural circles deplore the death of Edmond Guillaume, an old Prix de Rome, architect of the Louvre and Tuileries, and professor at the Ecole des Beaux Arts. Commissioned after his return from Rome with a scientific mission in Asia Minor he there made several very interesting explorations in Mysia and Bithynia, which were published in book form at the expense of the State. He made also many very interesting restorations of the Grecian Temples. Later on Guillaume was appointed architect to the Palaces of Saint Cloud, the Archives, Versailles, Louvre, and Tuileries. As Professor at the Ecole des Beaux Arts he published many interesting works on the history of art and ornament, and on Greek and Roman antiquities. He died at the age of sixty-nine.

A few notes on the new sanitary law which has just been voted for Paris may be interesting now that the city is to be drained by the system of Tout a l'egout. The town is authorised to borrow for the purpose of sanitary measures the sum of five million pounds repayable in 75 years, and to be thus employed: Work to be done for raising and carrying away drainage matter to the lands given up for the purpose of converting the matter into products for agricultural uses, the buying of these lands and the preparation of the same, one and a quarter million pounds; completion of the system of drains, repairing and improving of those existing, and the construction of new collecting drains, one and a half million pounds; completion of the water supply for drains, construction of reservoirs, filtering basins, two million pounds; the rest of the money being reserved for repaying and interest.

The proprietors of houses situated in the streets provided with public drains are obliged to connect their house drainage underground, and directly to the main; a delay of three years is allowed for the completion of this private work. The town of Paris is permitted to levy taxes on these houses proportionately to the rateable value of the property in payment for the removal of drainage matter, from a tax of 8s. 6d. on a house rated at £20, and proportionately to £20 for a house rated at £1,600 to £60 for property rated at £4,000 and above. If for any reason a property has no rateable value as regards taxes, the drainage tax is fixed at £2 per down pipe. The town is allowed a delay of five years for the completion of all work pertaining to this system of thorough drainage.

The hospitals for the construction of which a large sum of money was left by the late proprietress of the Bon Marché, Madame Boucicault, are now advancing, and but for the delay made by the Assistance Publique at Paris, should by this time be completed. These hospitals, of which there will be one at Paris for old people and idiots, and three in the provinces at Lille, Rouen, and Chalons, destined as refuges for girl-mothers, are supposed to combine all the best and most modern requirements of such buildings, and will probably form an interesting study when completed. The hospitals will be arranged for the reception of the young mothers in separate rooms if desired and privately.

The subject for the Prix de Rome, at the Ecole des Beaux Arts, this year, was a central school of arts and manufactures, to be erected in the capital of an important country. This school, reads the programme, is purposed for the formation of civil engineers for national industry, and reserve officers for the army and artillery. The building should therefore comprise two principal divisions, one for scientific studies, and one for military studies. The science division should contain the school offices and offices for the director, secretaries, treasurer, and dwellings for the school employés; a dwelling for the director with private entrance. The three school buildings for the three school years should be grouped around a large courtyard; there should be a large lecture hall for 250 pupils, having a surface of 2,000 square feet, waiting rooms for the professors and additional rooms for workshops, modelling studios, 24 class rooms, chemistry and physical rooms, and examination rooms, offices, galleries, and technical museums, a refectory for 750 pupils, kitchens and dependances, also a large library for 60,000 volumes, and galleries to contain objects of mineralogy and natural history. The military portion should comprise a large drill ground, stables, harness rooms, smiths' shops, and arm depots, and galleries to receive the artillery, also dwellings for the instruction officers.

It will be seen that the programme is very complete, and requires more especially the study of the planning than that of the façades, which should be characteristic, calm, and academical in aspect. Most of the ten plans and designs were well arranged as regards the various portions of the building. The winner of the Grand Prix is Mr. Recoura, of the second Mr. Patouillard, and of the third Mr. Heraud.

The official programme of the competition for the Exposition of 1900 is now ready for architects and engineers, or for any amateur who may desire to put forth his idea for the planning of the work. All desiring to compete will receive a copy of the programme, a plan of the available ground on a scale of one two-thousandth, a list of the general classification of the objects to be exhibited, and a plan of the necessary surface required for each group of exhibits. The ground given up for the Exposition will be the Champ-de-Mars, the Trocadero, and surroundings, the Conference and Orsay quays, the Esplanade des Invalides, the Palace of Industry and surrounding grounds. The principal communication between the two banks of the Seine will be a new bridge facing the Invalides. The available ground will therefore be much larger than that employed for the last Expositions, the Palais d'Industrie and grounds being added. In their plans and designs the competitors should indicate more especially the position of the principal buildings, and the proposed means of communication between the opposite banks of the river. Arrangements should be made for the large Salle des Fêtes and buildings for the congress and administrations, free spaces will be left for the buildings to contain exhibits from the colonies and foreign nations, and also those for private exhibitions, theatres, and cafés. The competitors should also study the arrangement of the parks, gardens, water effects, and other decorations, and also the means of mechanical conveyance of visitors in the exhibition grounds. The competitors have the liberty to modify any of the existing buildings including the Eiffel tower, the Trocadero building should, however, be left untouched. The building may be erected hanging over the river, on the quays, above the railways, and on the Invalides bridge if desired; but it is desired to obtain as decorative effect as possible with inexpensive materials. The competitors must provide a general plan at a scale of one two-thousandth; detailed plans, scale of one-thousandth; façades and sections, scale one five-hundreth; a bird's eye view of the whole design, an estimate of the total cost with details based on prices per square or cubic yard, for each of the elements of the design; an explanatory note on the whole design, with the manner of construction, and if the author desires a development of a portion of the idea to a large scale. Four months are given for the preparation of plans and designs, the last day for sending in being the 12th of December, when the drawings will be exhibited to the public and afterwards submitted to a jury of 31 members. The prizes to be awarded are, three of £240, four of £160, five of £80, and six of £40; the premiated designs becoming the property of the administration. The total surface to be covered by the Exposition will be about 10,000 acres.

At the Ecole des Beaux Arts the Chevenard prize concours, open to painters, sculptors, architects, and engravers has just taken place. A legacy provides an annual sum of £2,000 devoted to the aiding of poor art students who have already carried off several awards in the school competitions, and show a certain promise of ability. Those of the school pupils who wish to compete for these scholarships send in rough sketches of any design or subject which they may choose; of these sketches, six are chosen from each of the four sections of art, twenty four in all. The authors of the sketches chosen by the jury have to study and improve on their first idea during the course of a year, working on the subject until each one produces finished drawings, paintings, or designs for presentation at the final competition. Each pupil receives an indemnity of £5 per month on the condition that he studies seriously his chosen subject at the studio of the professor under whom he works. At the end of the year the test of each section of art receives a prize of £60. A large portion of the legacy is also devoted to aiding poor art students. In the section of architecture this year, four sketches only were considered interesting, these being for a military school, a large public square, Salle des fétes, and an Eden for 1900.

The prize of £60 given by the Academy for the best work of architecture completed in the year is awarded to M. Hardy for his fine work of Notre Dame de Lourdes.

The international exhibition of urban sanitation at Boulogne opened on the 5th of August, appears to be very successful; this exhibition will remain open until the end of September.

The new sanitary measures for Paris still meet with a large amount of opposition from proprietors of land around Paris, destined to be employed for the laying out and conversion of the drainage matter. At Herblay, a portion of country traversed by the main drain, the engineer entrusted with the construction of the work has been forbidden by the mayor of the commune to continue the work of excavation, and on the refusal of the former has appealed to the courts of Versailles for the carrying out of his desires *manu militari*. It is claimed that these lands have not been legally expropriated.

Paris will soon be provided with electricity for lighting and domestic purposes in every quarter of the city; centres of electricity are being established for each arrondissement. As in the crowded portion of Paris it is a difficult matter to find space for the erection of these centres, and the piece of ground and the cost of expropriation expensive, it has been found more economical and convenient to construct buildings underground for the reception of the power engines and dynamos. One of the most interesting of these now in the course of construction is that under the gardens of the Palais Royal destined for the supply of electricity to the quarter of the Exchange. The portion for the machines is situated directly under the large *cour d'honneur*, and consists of a hall over one hundred feet long by sixty-five feet broad, and nearly twenty feet deep. Three large lantern lights are raised slightly above the surface of the gardens, and are hidden as much as possible by shrubs. The smoke given off from the seven boilers is carried away underground for a distance of a hundred feet to a chimney stack erected in the courtyard of a house outside the Palais. The question of ventilation and aeration has been properly studied, and the centre is considered as a model of its kind. This centre will light a large number of lamps in its neighbourhood, the Théâtre Français and that of the Palais Royal, the galleries, dwellings, and shops of the Palais, and will serve as a help for the lighting of the grand boulevards, and the Elysée during fête time. The constructional work is due to M. Chabrol, architect of civic buildings.

Arthur Vye Parminter.

SKELETON BUILDINGS.

IN a paper on the engineering features of the Harrison Buildings at Tenth and Market-streets, the author, Mr. W. Copeland Furber, member of the Engineers' Club, Philadelphia, describes in the *Proceedings* of the Engineers' Club, the construction of this building. The Harrison building is a curtain-wall structure. All the weight is carried on the columns on three sides; the party-wall is of brick masonry. The columns are 21ft. apart, and of the Phœnix pattern. The girders supporting the curtain are rolled iron with top and bottom cover plates, and the interior girders are 24in. built beams. The attachment of the girders to the columns is by means of a "pintle" plate, which is a plate set between the sections of the column on its diameter, and is riveted to the web of beam. The joists are of Georgia pine, and the floor of 3in. spruce with 1in. maple floor. Asbestos and waterproof linings are placed between the rough and finished floor. The unit strains used for columns were $13,000 - 20\frac{l}{r}$; for rolled beams, 16,000; built beams, 13,000; and for wood beams, 1,500. For brick masonry the resistance to crushing was 150lb. per square inch. The floors were calculated for 200lb. live load, the girders for 85 per cent. of this, and the columns for 75 per cent. in addition to dead load. The footings are proportioned for a total load of 4 tons per square foot. No settlement has been discovered. The walls are of dark brown Pompeian glazed bricks, and the terracotta work is backed with common brick. Cement, with a small amount of lime, was used. The roof is covered with tin. The design is described as Italian Renaissance. The area of building is 65ft. by 200ft. Messrs. Cope and Stewardson were the architects. In the Harrison Stores, on an area 308ft. by 137ft., concrete piers are used square in area 20ft. in height for the basement, and were built to receive a load of 200lb. per square inch from the columns. The concrete was of Portland cement of American manufacture, mixed with three parts of coarse, tide-washed bar sand and five parts of crushed rock free from dust.

THE BATH PUMP-ROOM EXTENSION.

AT the Guildhall, Bath, on Friday, Mr. W. J. B. Clarke, Local Government Board inspector, held an inquiry into the application of the Town Council for power to borrow £30,000 for buildings in connection with the pump room. For the corporation Mr. King said that for several years there had been felt in Bath a need of more accommodation for visitors in connection with the pump room. The design the council proposed to carry out, provided not only for the extension of the pump room, but for the protection of the Roman bath, the idea being to incorporate it in the general scheme of the bathing establishment.

Mr. King alluded to the obtaining of plans for the building, and explained that, after full discussion, the council accepted as the architect the author of a design marked "K," which proved to be Mr. J. M. Brydon, the architect of the Municipal Buildings and the Technical Schools now being erected in the city. The Mayor, who gave evidence, questioned by Mr. David, who appeared for certain opposing ratepayers, said the council, in December, 1893, decided to adopt the plan of "O" (who proved to be Major Davis, city surveyor of Bath), but he did not put his name in the envelope; the council rescinded the resolution adopting this plan, and ultimately decided that "K" (Mr. Brydon) should be the architect of a modified scheme, with Mr. Alfred Waterhouse, R.A., as adviser. Sir Jerom Murch, seven times mayor of the city, also supported the plan. He was aware that the Society of Antiquarians had objected to the present scheme on the ground that the scholæ (the platform) around the Roman bath would be built upon. Mr. J. M. Brydon, F.R.I.B.A., was called, and gave evidence as to his plans. He declined to express an opinion on the plans of Major Davis. The disturbance of the Roman work would be infinitesimal, but it was impossible to cover the bath in one span without building on the scholæ. Major Davis, F.S.A., produced plans of new vapour baths, to cost £1,000, which are part of the scheme. Questioned by Mr. David, he said no plan could commend itself which contemplated building on the scholæ. The inspector said he was not an antiquarian, but it seemed that a very small percentage of the Roman work would be disturbed—about 400ft. out of a total of 5,000ft. The light pillars would be only a foot square each. After a previous inquiry the Local Government Board had sanctioned a loan of £6,000 for acquiring the site for the specific object of extending the baths. What could be done with the site if the building were not erected? Mr. David spoke at length in opposition to the proposal, contending that the plan of "O" was preferable, and that such an ill-considered expenditure should not be sanctioned by the Local Government Board.

AN IMPROVED T-SQUARE.

THE improved T-square shown in the figures is contributed to the *American Machinist* by Mr. F. W. Clough, who says:—The improvement consists of the addition of the steel plate D, which may be screwed or riveted to the blade B. Both of these have slots 1 and 2, as shown on a larger scale in Fig. 3. A swivel bolt, C, passes through slot 1. The sides of this bolt are flat, and fit the slot accurately. The slot 2 engages with the pin E driven into the head A. The advantage of this arrangement is that the blade can be set square to the head with great accuracy. In disengaging the pin E and the slot 2 the blade can be set to any desired angle, and, bringing these again into engagement, the blade will be square to the head without any testing of its accuracy. The reliability of the action is shown in Fig. 4, in which each one of the parallel lines was drawn after a separate setting. I have used this T-square with very satisfactory results.

BRITISH BUILDING STONES.—XIII.

SCOTLAND (*continued*).

No.	Quarry.	County.	Geological Formation.	Description.	Colour.	Weight of a Cube Foot.				Water Absorbed per Cube Foot.	No. of Cube Feet to 1 ton.				Remarks. Where used, analysis, crushing strain in tons per ft super., cost per cube foot.
						Dry.		Wet.			Dry.		Wet.		
						lb.	oz.	lb.	oz.	Pints.	ft.	in	ft.	in.	
410	Ord (East) .. Berwick-on Tweed.	Berwick..	Old Red Sandstone. *Devonian.*	Fine-grained soft sandstone.	White, with a pink tinge.	128	5	137	2¾	7	17	5½	16	4	Corn Exchange, Berwick, Langridge Towers, and many villas in Berwick. Cube stones, under 6ft., 10d.; 9ft., 1s.; 12ft., 1s. 3d.; 14ft., 1s. 6d.; 16ft., 1s. 9d. Superficial stones, under 5ft. by 5in., 6d.; under 8ft. by 6in., 8d.; under 10ft. by 7in., 10d.; under 18ft. by 7in., 1s. 6d. Wall stones, per load, 1s. 3d. Long stones, under 4ft. by 12in. by 7in., 8d.; under 5ft., 10d.; under 7ft., 1s. Rybats, corners, ashlars, skews, and coursers worked in this quarry. Wall stones, 1s. 3d. per load; add 1s. 4d. per load cartage to Tweedmouth railway station. The stones in this quarry can be cut to any thickness, from 15ft. to 20ft. Some stones do not turn out quite so good for building as others.
411	Peterhead ..	Aberdeen.	Granite.	Transparent quartz, pink, orthoclase, whitish albite, and black mica (biotite).	Pink.	162	12	163	2	¼	13	9	13	8¾	Used for monumental work, shafts, pilasters, &c. Analysis silicon oxide, 73·70; aluminium oxide, 17·20; ferrous oxide, 0·41; ferric oxide, 3·15; calcium oxide, 2·92; magnesium oxide, 1·20; sodium oxide, 3·25; potassium oxide, 3·90; crushes with 973 to 1,345 tons (B).
412	Pitairlie ..... Newbigging, Dundee.	Forfar ..	Old Red Sandstone. *Devonian.*	A fine-grained compact sandstone; bedding distinct, little mica.	Bluish grey.	156	7½	159	7	Thick Rock. 2⅜	14	3¾	14	0½	The pavement is 6d. per foot super. on rail at Monikie station.
						153	3¾	156	15	"Slate" Bed. 3	14	7½	14	4	
413	Plean .... Bannockburn.	Stirling ...	*Carboniferous.*	Fine-grained sandstone, even close texture little mica rubs smooth. No bedding seen.	Light grey.	145	8¼	150	6½	3⅞	15	4½	14	10½	New Post Office, Falkirk; Burgh Buildings and Brentham Park House, Stirling; Burgh Buildings and Co-operative ditto, Alloa; Naemoor House, Rumbling Bridge. This rock is from 12in. to 3ft. thick. Random blocks, not confined to length, breadth, or thickness, 1s. 2d. per foot; sized blocks, under 15ft. cube, 1s. 2d.; up to 60ft., 4s. 3d. Broad stones, under 6ft. and 6in. thick, 8d.; 14in. thick, 1s. 6d.; under 35ft. and 6in. thick, 2s. 10d.; up to 14in. thick, 4s. 3d. Long stones, 4ft. by 12in. by 7in., 3s.; 4ft. by 24in. by 11in., 9s. 8d.; 12ft. by 12in. by 7in., 20s. 9d.; 12ft. by 24in. by 11in., 74s. 9d. Columns, 6ft. by 15in. by 15in., 18s. 11d.; 6ft. by 24in. by 24in., 63s. 11d.; 15ft. by 15in. by 15in., 109s. 10d.; 15ft. by 24in. by 24in., 325s. 10d. Stones under 12in. broad charged as 12in.; sized stones of common rock 10 per cent. less than above prices, which are quoted for delivery on trucks at quarry. Common rubble, 1s. 3d.; founding rubble, 2s. per ton; crushes with 569·5 to 637 tons (B).
414	Pyotdikes ... Muirhead. Dundee.	Forfar ...	Old Red Sandstone. *Devonian.*	Fine-grained, compact; rubs rough; little mica.	Bluish-grey.	156	3	158	10	2	14	4	14	1½	Dundee Harbour Works. Cube stones, not exceeding 5ft. cube and under 5ft. long, 1s. 2d.; ditto, and under 10ft. cube, 1s. 3d; 10ft. to 15ft. cube, 1s. 4d.; 15ft. to 20ft. cube, 1s. 6d. Ashlar, random lengths, under 8in. thick, sawn or face, 1s. 1d.; ditto machined on face, 1s. 2d. Steps, machine faced and sawn on breast, under 7ft. long and 7in. thick, 1s. 2d.; ditto machine breasted, 1s. 3d. per super. foot. Wheel steps 1d. extra per super. foot. Prices are for stones on trucks at Dronley station.
415	Ravelston ... Blackhall.	Edinb'rgh	Calciferous Sandstone. *Lower Carboniferous.*	Quartz grains in contact; cavities in mass, with ochreous spots, and mica in bed plans.	Light brownish-grey.	141	2¾	146	13½	4½	15	10¼	15	3	Has been exported to America. There are two kinds of rock in this quarry—common or bed rock, and liver rock. Cube stones, 10in. thick and upwards, under 5c.ft., bed rock 1s., liver rock 3s. 6d.; 15ft. to 20ft., 1s. 8d. bed rock, 5s. liver rock; up to 30ft., 2s. 6d. bed rock, 7s. liver rock per cube foot. Broad stones, under 10in. thick and containing under 10ft. super., bed rock 2s., liver rock 2s. 6d.; containing 25ft. and under 30ft., common rock 4s. 6d., liver rock 5s. 6d. Rubble, 2s. 6d. per ton; hill rubble, 2s.; hand rubble, 1s. 3d. Dyke stones, bottoming, 9d. and 6d. per ton, in carts at quarry. Crushes with 782 tons (B). This stone is similar to Craigleith.
416	Ross of Mull	Argyle ...	Granite.	Much transparent quartz; pink orthoclase, with a little biotite.	Pale pink.	163	3½	163	8¾	¼	13	9	13	8½	Westminster Bridge; Holborn Viaduct. Crushes with about 1,300 tons to the foot. The Viaduct piers failed with less than the hundredth part of this weight, owing to hollow bedding and the improper use of lead in the beds. Analysis:—Silicon oxide, 74·48; aluminum oxide, 16·20; ferric oxide, 0·20; calcium oxide, 0·13; magnesium oxide, 0·27; sodium oxide, 3·78; potassium oxide, 4·56; water, 0·60.
417	Rubislaw	Aberdeen.	Granite.	Fine grain; white quartz, and orthoclase; black mica.	Dark grey.	166	13½	166	14¾	1-13	13	5	13	5	Bell Rock Lighthouse, London Bridge, Waterloo Bridge. Crushes with 915 to 1,334 tons (B).
418	Springfield.. Kelso.	Roxburgh	*Lower Carboniferous.*	Moderately fine-grained sandstone; speckled with black; bedding not distinct	Grey.	128	13¾	137	9¾	6⅝	17	4½	16	3¼	This quarry does not produce large stones. Random blocks can be delivered to rails for 1s. 3d. per foot.
419	Stirling Hill Peterhead.	Aberdeen.	Granite.	Glassy quartz; pink orthoclase; black mica.	Pink.	161	2	161	10	⅝	13	10¼	13	9¾	Columns Carlton Club and Fishmongers' Hall, London; shaft Duke of York's Column; Provincial Bank, Dublin.
420	Swinton ,......	Berwick...	Calciferous Sandstone *Lower Carboniferous.*	Fine-grained micaceous sandstone.	Brownish-grey.	130	3	138	14¾	6½	17	2¼	16	1½	This quarry is worked by the proprietor of Whitesome Newton, No. 424, into whose hands it came about three years ago. He reports it as yielding a better weather stone than Whitesome Newton. "It will stand fire, looks well on a southern exposure, but is dark to the north." Prices of stone same as No. 424.
421	Sylavethie... Alford.	Aberdeen.	Granite.	Quartz, orthoclase hornblende, biotite, and sometimes schorl.	Dark grey.	170	0	170	7½	⅝	13	2	13	1¾	Used in Aberdeen for monumental and other polished work.
422	Threewells. Bervie, Fordoun.	Kincardine.	Old Red Sandstone. *Devonian.*	Micaceous fine-grained sandstone, rubs smooth; bedding not distinct.	Purplish brown.	141	5½	147	6½	4⅞	15	9½	15	2½	Both local banks. Free church, and several private houses, Bervie. Quarry beds from 3in. to 18in. thick. Cube stones not above 4ft. long, and not more than 10ft. cube, 1s.; stones for oven soles, 1s. 2d.; Garling, 10in. broad, 3in. to 4in. thick, 4d. per linl. foot; "ruble," 1s. 6d. per ton in load; "scuncheons," 18in. to 20in. long, 12in. to 13in. high, 6d.; broad stones under 6ft., 6in. thick, 7d.; 7in. thick, 8d.; 8in. thick, 9d.; 9in. thick, 10d.; under 24ft., 6in. thick, 11d.; 7in. thick, 1s.; 8in. thick, 13d.; 9in. thick, 14d. Long stones all 14in. by 7in., 3ft., 2s.; 4ft., 2s. 8d.; 5ft., 3s. 9d.; 6ft., 5s.; up to 10ft., 12s. 6d. Flat lintels one-fourth more. Prices are at quarry. Delivery to rail, 15d. per ton extra.
423	Victoria ..... Birsemore, Aboyne.	Aberdeen.	Granite.	Large crystals of pink felspar; glassy quartz, and biotite.	Dark grey, with pink crystals of large size.	164	14¾	165	2¾	⅜	13	7	13	6¾	A very handsome granite, something like that from Shap. There are crystals of milk-white felspar in the ground mass, but these are much smaller than the pink crystals, which latter make the rock porphyritic in structure.
424	Whitesome . Newton.	Berwick .	Calciferous Sandstone. *Lower Carboniferous.*	Fine-grained micaceous sandstones, with carbon spots.	Grey, with brownish-green tinge.	130	11½	139	8⅝	7	17	1½	16	0½	This quarry has supplied stone for nearly all the mansion houses in Berwickshire, and is extensively used in Edinburgh, where the "Students' Union" was recently built out of it. "Shows signs of weathering at Pillars in Meadows, 1888" (Craig). Randon block not exceeding 10ft. cube, 11d.; if cut to two special sizes, 1d. per foot extra; if cut to three, 2d.; and for every addditional foot, or part of a foot in length, 1d. per foot extra. Prices net on waggons at Edrom.

NORTHERN POLYTECHNIC INSTITUTE, HOLLOWAY ROAD.—"THE JOURNEY OF THE MAGI."—ARCHITECTURAL ASSOCIATION EXCURSION SKETCHES AT WELLS.—"BUILDING NEWS" CLUB DESIGNS FOR A COCOA TAVERN AND VILLAGE CLUB.—HOUSES AT THE HANWELL PARK ESTATE.—HALL IN A HOUSE AT WASHINGTON.

Our Illustrations.

THE NORTHERN POLYTECHNIC, HOLLOWAY-ROAD, ISLINGTON.

The building occupies a site with a frontage to the Holloway-road of about 132ft., but it extends backwards a considerable distance in rear of other properties, and there is a cart entrance from Brand-street in the Hornsey-road. All the social and recreative rooms are on the ground floor, the various classrooms and workshops being placed in three blocks of three floors each, one facing the Holloway-road, where is also the main entrance to the Great Hall, and also entrances for male and female students; a second block midway in the depth of the site, and the third, containing the men's technical classrooms, in the rear. By this arrangement all rooms have light on each side of them. The entrances from the Holloway-road lead into wide corridors extending the whole depth of the site, between which are the social and recreative rooms common to both sexes of students. The official rooms for the secretary and principal, inquiry offices, &c., are on the ground floor at the entrance, the governor's room being on the first floor in rear. The Great Hall accommodates about 800 persons, in addition to the orchestra for 250, and has cloak and retiring-rooms in front and rear, also a spacious band-room below the orchestra. In rear of it is the men's gymnasium, with dressing-rooms, &c., adjoining; also a large club or common room. The heating chamber is below in a half-basement. The men's side has classrooms and workshops for drawing, modelling, carving, masonry, brickwork, smith and founder, brass and ironwork, electrical and general engineering, carpentering, chemistry, and photography, &c. The women have rooms for cookery, laundry, dressmaking and needlework, drawing, designing, and art work generally; also a gymnasium. Refreshment rooms and kitchen are also provided, with lavatories on each floor. The heating of the buildings will be by steam and hot water, and the ventilation has been carefully studied. The general disposition of the various rooms has been considered and approved by Sir Philip Magnus and Professor Garnett, of the County Council Technical Board. The Holloway-road front will be of red Leicester brick and Bath stone. The Great Hall will have a semi-circular roof supported by iron principals, and the walls will be faced with white and coloured bricks. All the principal rooms and corridors will have glazed brown brick dadoes and solid block floors. The architect is Mr. Charles Bell, F.R.I.B.A., of 3, Salter's Hall-court, E.C., whose design was selected in October last out of six submitted by selected architects; and the contractors are Messrs. Macfarlane Bros., of Hornsey-road, whose tender of about £30,000 has been accepted, and two sections of the building will be proceeded with at once. We illustrated Messrs. Roger Smith and Son's design, submitted in the same competition, on December 1st, 1893, and that sent in by Mr. A. H. Tiltman on December 8, 1893, and May 25, this year.

OLD MASTERS ON THE CONTINENT.—VIII.

In our issue of the 27th ult. we illustrated and described one-half of the masterly fresco illustrating "The Journey of the Magi," executed by Benozzo Gozzoli, in the latter half of the 14th century, on the right-hand wall of the private chapel on the first floor of the Palazzo Riccardi at Florence. This week we give the second portion of the fresco, which joins on the right of that now published. It will be seen, on comparison of the two plates, to be more crowded, but more skilfully composed, and withal more full of interest and variety than the first part. Mr. C. L. Eastlake's article will be found on p. 241 *ante*, and further illustrations of these frescoès will appear in early issues of the Building News.

COLLEGE LIBRARY AND CHAPEL, VICAR'S CLOSE, WELLS.

We have concluded our descriptive itinerary in connection with the A.A. excursion this year in the neighbourhood of Wells, and have little to add here in respect to this building, of which we give two excellent pencil drawings by Mr. Charles Spooner to-day. The chapel, with the library over, dates from the days of Bishop Beckington, whose executors are reported to have completed the upper part. Portions of 13th-century sculpture are incorpórated in the walling above the principal window, adding much to the interest and richness of the work, besides recalling the skill of the artist who executed the portion erected by Bishop Joceline. The interior has been much improved by the restorations carried out by the late J. D. Sedding. Great difficulty was experienced in keeping back the damp soaking through the walls of the chapel on the north side from the land above the site, which reaches a higher level. This damp caused much damage to Mr. Heywood Sumner's mural decoration in sgraffito.

"BUILDING NEWS" DESIGNING CLUB: COCOA TAVERN AND CLUB.

We illustrate this week, by plan, section, elevation, and perspective, the design by "Boomerang," placed first, and that by "Art," placed second, in this Club competition. A critical review of all the designs submitted will be found on p. 242 *ante*.

HANWELL PARK ESTATE.

The houses herewith illustrated have just been built from the designs of the architects to the estate, Messrs. T. W. F. Newton and Cheatle, 121, Colmore-row, Birmingham. Mr. D. Edwards, of Barnt Green, was the builder. It is intended that the estate shall maintain a distinctive character in its architecture, and no house of the usual type so dear to the heart of Mr. Buggins will be allowed.

HALL IN HOUSE AT WASHINGTONVILLE, N.Y.

This interior view shows a modern American hall of somewhat novel treatment, and will prove of interest to our readers. The cosy alcove, partly revealed and partly screened off from the stairs by high turned balusters, makes a valuable adjunct to an entrance hall. Here a visitor may be interviewed without being admitted to more private parts of the house, or it can be utilised for a chat with a more familiar friend of an evening, when interruption from the outside world is not so likely to occur. The furniture and design of chimneypiece are in simple and good taste. Mr. E. G. W. Dietrich, of New York, is the architect, and we are indebted to the *American Architect* for the illustration.

◆

The little Roman Catholic church of St. Osmund, Salisbury—one of those designed by Augustus Welby Pugin—has been enriched by a stained-glass window in memory of the late Canon Crook. It represents St. George and St. Edward the Confessor. The work of enlarging St. Osmund's church and school has been commenced by the contractor, Mr. Kitch, of Bridgewater, the total cost being estimated at about £1,500. From the plans of the architect, Mr. E. Doran Webb, F.S.A., it is intended to add to the church a north aisle, corresponding with the south aisle, and to erect at the eastern end of the new aisle a chapel dedicated to the Sacred Heart. The sacristy is also to be enlarged. To the school, which adjoins the church, there are being added a porch and a classroom, 16ft. by 18ft.

BOOKS RECEIVED.

Modern Methods of Sewage Disposal, by Geo. E. Waring, jun., M.Inst.C.E. (London: Sampson Low, Marston and Co., Ltd.). The author of this work is an American, and his object is to set forth the results of study and experience of engineers, chemists, and biologists as to the methods of sewage disposal. Mr. Waring chiefly describes American practice, though frequent reference is made to English methods and authorities. The principles and practice of sewage disposal are set forth by the author in separate chapters dealing with the treatment of sewage before final delivery, discharge of sewage into roads, &c., methods of disposal, the degree of purification required, sewage irrigation and farming, filtration with aëration, chemical treatment, &c. Four methods of sewage disposal are discussed—(1) irrigation, (2) filtration, (3) chemical precipitation, (4) sedimentation, which are described. The author does not favour any chemical precipitation process; he alludes to the accumulation of offensive sludge, and the last process, unaided deposition of the heavier solids is objected to on the same grounds. Sewage irrigation is more favourably entertained under proper conditions, and the conclusions of the author are summed up in those of the Sewage of Towns Commission (1858). Mr. Waring's book is a useful *résumé* of methods and principles.

CHIPS.

The Fulham workhouse is about to be enlarged from plans by Mr. Saxon Snell. The contractor is Mr. B. E. Nightingale, of Albert Embankment, whose tender, the lowest of six sent in, was accepted at £5,095 by the board of guardians.

The town council of Wolverhampton decided last week to raise the salary of Mr. Woodward, the waterworks engineer, from £250 to £350 a year.

The death is announced from Paris of M. Léon Cugnot, some of whose symbolic statues ornament the Louvre, the new Hotel de Ville, the Palais de Justice, and other public buildings in that city.

Edinburgh, notwithstanding the settlement of the recent application, is still in difficulties over its tramways, and the Board of Trade has just appointed Mr. Henry Tennant, of Holgate Hill House, York, to act as arbitrator between the city council and Messrs. Dick, Kerr, and Co., the new lessees.

Mr. W. Strawbridge, who has for some years been Deputy Surveyor-General of South Australia, has been appointed to succeed Mr. G. W. Goyder as Surveyor-General.

New vestries and a side-chapel are about to be added to St. John's parish church, Hammersmith, from designs by the architect of the reconstructed building, Mr. Hugh Roumieu Gough, of Carlton Chambers, Regent-street, W.

The town council of Maidstone, after considerable discussion, adopted at their last meeting a report from a committee, some of whose members had visited various common lodging-houses in London, Salford, Oldham, Huddersfield, and Bradford, and who recommended that steps be taken to provide a municipal common lodging-house in the borough to accommodate not less than 150 lodgers, viz., 110 single beds for men, 30 for women, and 10 double beds for married couples.

The bells of the parish church of Melton Mowbray, eight in number, have been re-tuned and re-hung by Messrs. Wm. Taylor and Son, of Loughborough, and in addition two new ones have been added to the peal, making ten bells. Extensive alterations were found to be necessary, in consequence of the decayed nature of the oak beams bearing the framework, which consists of two new steel girders supporting the oak beams and iron frames upon which they are now working.

The Mayor of Exeter will open the Ecclesiastical Art Exhibition, to be held at the Higher Market, Exeter. The ceremony will take place on the evening of Monday, October 8, and the exhibition will keep open till the following Friday.

A bazaar, which is to extend over the week, was opened on Monday at Riviere's Concert Hall, Llandudno, in aid of the building fund of the church now in course of erection at Llandudno as a memorial to the Duke of Clarence. The church is being erected on a site given by Lord Mostyn in East Llandudno, which forms part of the large and scattered parish of Eglwys Rhos. The mother church of Llanrhos, nearly two miles distant, has been found to be quite inadequate for the growing watering-place. Lady Augusta Mostyn has headed the building fund with a subscription of £1,000, the total amount now raised being about £4,000. The erection of the nave will cost £7,000. Accommodation is to be provided for 1,000 worshippers, and the total estimated cost is £10,000.

Engineering Notes.

Ivanhoe Tunnel, Col.—The Ivanhoe Tunnel, which is on the point of being completed, is cut through the backbone of the Rocky Mountains from Busk, a small hamlet 15 miles west of Leadville, Colorado, to Ivanhoe, another little village on the west side of the main range. The tunnel is 9,400ft. long, and is only surpassed in length in America by the Hoosac Tunnel and the Boulder Tunnel, in Montana, the latter being but 300ft. longer than the Ivanhoe. The tunnel is 21ft. high and 15ft. wide in the clear, and to admit of timbers the heading had to be 22ft. 9in. by 18ft. 6in. 200lb. of giant powder and 800ft. of fuse were used every 24 hours. During construction the tunnel has been lighted by electricity, with an arc light every 80ft., and several large air-compressors supply fresh air to the workmen. At each approach eight compressed-air drills were working, but the amount driven per day averaged only 8ft. The distance from the centre of the tunnel to the surface is 1,200ft. Where the Ivanhoe Tunnel enters the mountain at Busk, the altitude is 10,800ft. It lessens the distance between Busk and Ivanhoe by over seven miles. The rise to Hagennan is only 1·41 to every 100ft. Owing to the high altitude, doors will be placed at each end to keep out the snow, and the tunnel itself, for several hundred feet from each end, will be heated by steam. The work of construction, for which Mr. H. P. Keefe is the contractor, was begun in August, 1890.

Liverpool Docks.—The report of Mr. G. F. Lyster, dock engineer to the Mersey Docks and Harbour Board, shows that during the twelve months ending July 1st extensive alterations and improvements have been made on the Dock estate and the approaches to the docks. The principal improvements on the estate are those at the Canada and Huskisson Docks, which includes the construction, now in progress, of a 100ft. lock at the Canada, and a branch dock in connection with the same, and a new half-tide dock, with entrances and passages into the river. Altogether some 110,000 cubic yards of excavations have already been carried out, and about 60,000 cubic yards of masonry and concrete put in. As to the improvements in the river itself, during the year some 140,000 tons of rock, clay, &c., have been dredged up from the bed of the river to deepen the river entrances near the North Pierhead, whilst from the bar of the river nearly four and a half million tons of sand have been dredged up, and from the Crosby Channel upwards of 300,000 tons. The total quantity of sand removed from the bar since the operations were commenced is 6,845,860 tons. The result is that there is now a channel 1,000ft. wide, the depth of which is not less than 20ft. in any part at low water extreme spring tides.

The Royal Assent was given on Friday to the following, among other Bills:—British Museum (Purchase of Land). Valuation of Lands (Scotland) Acts Amendment, Public Libraries (Ireland) Acts Amendment, Dundee Suburban Railway (Extension of Time), East London Water, Southwark and Vauxhall Water, West Middlesex Water, London County Council (Improvements), North Cornwall Railway, Plymouth and Dartmoor Railway (Extension of Time), and the Exeter, Teign Valley, and Chagford Railway.

In 1889 the town commissioners of Ramsey, Isle of Man, commenced the construction of an entirely new sewerage system for the whole of the town, designed by Mr. James Mansergh, M.Inst.C.E. By this scheme the outlet for the town has been constructed at the extreme north end of the district, and up to the present the sum of £12,000 has been expended on the work. During the present year nearly all the sewage has been diverted from the harbour, and by the end of the year the whole of the sewage will be carried to the new outlet.

A new arcade is being erected in one of the main thoroughfares of Oldham by Messrs. Wild, Collins, and Wild, architects, of Clegg-street, in that town. At one end a large Cambridge quarter-chime clock has been fixed, striking the hours on a large bell, and a quarter-chime upon four smaller bells by automaton figures, representing King Richard, Robin Hood, Friar Tuck, and Gurth the Swine Herd, from Sir Walter Scott's "Ivanhoe." The architects have also introduced an illuminated dial 6ft. in diameter. All the work has been carried out by Messrs. Wm. Potts and Son, of 13, Guildford-street, Leeds, and 22, Collingwood-street, Newcastle-on-Tyne, from instructions received from the architects.

COMPETITIONS.

Bolton.—At a meeting of the school buildings and sites committee of the Bolton school board, recently held, the award of the assessor in connection with the plans for the new central higher grade board school was considered. It had previously been decided by the board that the competition should be confined to local architects, and seven firms sent in plans, for which premiums of £50, £25, and £10 were offered, the first to be merged in the commission of the successful architect in the event of the board accepting his designs. The assessor appointed was Mr. E. R. Robson, F.S.A., of Westminster, consulting architect to the Education Department, who made his award as follows: (1) Mr. R. Knill-Freeman, F.R.I.B.A. (under the motto, "Lux"); (2) Mr. J. Simpson; and (3) Messrs. Woodhouse and Potts. At a meeting of the board, since held, this award has been confirmed, and the carrying out of the work intrusted to Mr. Freeman. In giving his decision, Mr. Robson refers in considerable detail to each of the seven designs submitted to him, and speaks highly of their architectural merit. Dealing with Mr. Freeman's design, Mr. Robson says: "This competitor submits a series of plans all very skilfully drawn and finished. The central hall measures 100ft. by 32ft., and on the basement there is no attempt to incorporate the areas at each end. At the back the whole area is judiciously excavated to the level of the basement floor. In the general treatment of the basement, the central portion is devoted to a gymnasium and dining-hall, similar to the school-halls overhead, while the manual instruction room, kitchen, &c., are placed next the street. On the ground and first floors the arrangement of the master's room, book store, lift, lavatory, &c., together with the supervision window into the hall, is very suitable and good. The building, which would accommodate 1,000 children, is proposed to be erected in dark-red brick, and is to have red terracotta dressings. One of the main features in the design at each end is the manner in which the utmost amount of light is obtained in the central halls. I have no hesitation in giving this competitor first place of merit as to architecture." In addition to the foregoing accommodation there are also provided, in Mr. Freeman's design, a physical laboratory and lecture-room, classrooms for the instruction of the different branches of drawing, and a large chemical laboratory and lecture-room to same. Suitable teachers' rooms and lavatory accommodation are also provided. The building is to be of four stories, with a handsome elevation, the style of architecture being the Renaissance, and the estimated cost of the work is £20,000.

Sheffield.—At the last meeting of the School Board, the Buildings Committee reported that a letter had been received from Mr. E. M. Gibbs and Mr. C. Hadfield, on behalf of the council of the Sheffield Society of Architects and Surveyors, with reference to competitive plans for the Tinsley Park-road School, pointing out, that in view of the assessor's report, and the fact that only three infants' classrooms are shown on the plans marked "Sanglier Rouge," those plans should have been set aside, and the first place awarded to "Multum in Parvo." The committee recommended that the following reply should be sent: "The Board regret to find that objection has been taken to their decision upon the recent competition; but I am to point out that your council has evidently laboured under the mistake of supposing that an assessor was appointed, whereas the Board simply asked for advice, and reserved to themselves the full power of determining which, if any, plan should be adopted. They made their selection in perfectly good faith, after very careful consideration, and they cannot alter their decision." The committee also considered a protest signed by nine of the competitors; but they did not recommend any action thereon. Mr. Rawson said that the plans which were selected did not conform to the conditions, as they only provided for three classrooms instead of four, and the other plans did conform. It seemed to him that there was justification for the protest of the architects, and good ground for the board asking for an explanation. Mr. Fletcher, chairman of the Buildings Committee, regretted that the architects had felt it necessary to make this protest, because there had not been the smallest desire on the part of any one connected with the board to do the least unfair thing towards them, and the committee had not allowed the assessor to select the designs: he had simply given the committee his advice, and they had treated it as the counsel of a skilled man. After some further discussion, the report of the committee was adopted.

Truro.—The City council of Truro in response to an offer of £175 in premiums, have received four schemes for the drainage of the city. The estimated cost of scheme No. 1 is £8,963, with an annual expenditure, exclusive of repayment of the loan, of £312; No. 2, £13,003 and £415: No. 3, £12,965 and £250; and No. 4, £12,915 and £439 respectively. It has been decided to submit the four proposals to an expert, to examine them in conjunction with Mr. Clemens, the city surveyor, and report back to the council, who reserve the right to select a scheme.

West Ham.—The Corporation of West Ham, who purpose to adopt a competition for a technical institute and free library, to be built on the Green, have decided to throw it open, and not to restrict it to eight invited competitors, as at first intended. The total cost of the building is limited to £40,000, and Mr. J. MacVicar Anderson, F.R.I.B.A , has been appointed as the assessor.

CHIPS.

At the Cutlers' Arms, Cutler-street, E.C., a testimonial was presented to Mr. Lewis Isaacs, F.R.I.B.A., late M.P. for Walworth, by his friends. Mr. Councillor John Hutt, of Manchester, presided, and made the presentation speech, in a felicitous address, commenting on the honest and upright career and the philanthropic virtues of their friend. The testimonial consisted of a gold chronometer watch and chain, together with a vellum address in a frame. Mr. Isaacs having responded, the festivities concluded with a dinner.

An iron girder bridge has recently been erected at Pontfadog, to supply the district with a means of access to the south side of the Ceirog. The bridge is of 32ft. span, and was built by Messrs. De Burgh, of Manchester. The abutments are of Cefn stone. The opening took place last week.

A block of Public Rooms is about to be built at St. Austell, from plans by Mr. Silvanus Trevail, M.S.A., of Truro. There will be a large hall, 80ft. by 40ft., on the first floor, and also a drill hall, local board room, fire brigade station, surveyor's offices, storerooms, kitchen, cloakroom, armoury, &c., on the ground floor, with club-room, cloakrooms, offices, &c., above.

One of the great breakwaters at Venice, extending nearly two miles into the sea, is now nearly completed, and the corresponding one well advanced. When they are completed, the port of Venice now so difficult to enter for large ships will be among the most accessible.

At the last meeting of the town council of Newport, Mon., it was decided to accept the tender of Mr. James Young, of Newcastle, for carrying out the works of water supply, and Mr. A. Sutherland, of Newport, was appointed clerk of works at a salary of £300 a year.

A new building is about to be erected for the Bridgnorth and South Shropshire Infirmary, on a fresh site in Broseley-road, Bridgnorth. Mr. Maidment is the architect, and the estimated cost is £4,500. The foundation-stone is to be laid in October.

At the London County Sessions, at Clerkenwell, on Friday, the churchwardens of Christ Church, Lambeth, appeared to prosecute a man named Reader for keeping a disorderly house in Southwark-street. During the hearing a Mr. Winsford, described as a builder, of Stamford-street, admitted that he "had made a good thing out of assisting in the prosecution of disorderly houses." He had got twenty convictions, and had received £200 in rewards. The witness was submitted to a very severe cross-examination, and admitted that he rather liked being an informer.

The will of Mr. Arthur Cawston, F.R.I.B.A., of 13, Queen Anne's-gate, and 18, The Grange, Wimbledon, who died on June 8th from a revolver accident, was proved on the 4th inst. by Mrs. Eveline Alice Cawston, the widow and sole executrix, the value of the personal estate amounting to upwards of £11,000. The testator appoints his share of the real estate and trust funds under the will of his late father, Samuel William Cawston, in trust for his daughter Cicy; and leaves the residue of his real and personal estate to his wife absolutely.

The agitation with regard to a public right of way across Kinderscout, in the Peak district, has led to the formation of a society for the protection of the public rights in footpaths and open spaces. At a meeting held on Thursday in last week, at Manchester, it was resolved that the society should be named "The Peak District and Northern Counties Footpaths Preservation Society." Rules for the conduct of the society were framed, and a committee was appointed to take further steps in the matter.

WAYSIDE NOTES.

SINCE Mr. Passmore Edwards accepted the presidency of the London Reform Union, several desirable features have been introduced into the propaganda of that organisation. One of the most useful is undoubtedly the institution of the "Citizens' Visit," a new educative function intended to instruct the public in the workings of municipal government. Last Saturday's was the fifth of the excursions, and the success attending them is worth chronicling in view of the fact that the "visits" are likely to be imitated in other large towns. The excursion was to the great drainage outfall at Crossness. The whole method of dealing with the London sewage was explained and studied on the spot, as was the vast deodorisation, precipitation, and separation work. Very few of the visitors who placed themselves under the care of the London Reform Union had any previous conception of the magnitude of the works and the extent of the processes they were about to witness, and when they read the reports of the main drainage committee of the County Council in future, it will be with a keener interest and more intelligent eye.

One of the older-fashioned artists' houses is going. Sir Edwin Landseer's house in St. John's Wood-road, in which he lived for nearly fifty years, is about to be demolished. Here the greater part of his life's work was executed, and in it his father, John Landseer, the engraver, died. It was for a long period the centre of the kindly artist's *entourage*. It is the dwelling which of all others in London belonging to artists has received the greatest number of distinguished visitors, always excepting that of Sir Joshua Reynolds in Leicester-square. Every room contains some trace of its former occupant. The door panels of one apartment pictorially chronicle the Queen's visits in 1863; a rustic seat in the shrubbery has the deeply-cut initials "E. L., 1857"; and even the courtyard contains signs of his handiwork. In a few days the work of demolition will commence, the site being required for the Manchester, Sheffield, and Lincolnshire Railway's London extension. Since Landseer's death, this house and studio have been occupied by Mr. H. W. B. Davies, R.A.

A new conservatoire of music is, by command of the Czar, being erected at Moscow, and the building will altogether cost £80,000—that is to say, two-thirds more than the Guildhall School, and nearly twice as much as the Royal College of Music. The architect is M. Zagorsky, and the school will accommodate about a thousand students, several of whom will be residential. In the square by which the new building will be surrounded are, by the Czar's wish, to be placed statues, and, among them, one of the late Nicholas Rubinstein, who was once director, and of Tschaikowsky, who for many years was a teacher at the Moscow Conservatoire.

Although not a fortnight has passed since the competition for the Paris Exhibition of 1900 was opened, there has been quite a rush of aspirants anxious to have the honour of furnishing the designs for the vast enterprise. The competitors, who number 260, are mostly young and unknown men, but this is probably due to the fact that the more distinguished architects are away on their holidays. A few members of the Institute, and some winners of the Grand Prix de Rome are, however, taking part in the contest.

Professor Virchow has been making a trip to the island of Gothenburg to view the numerous ancient edifices there to be found. He speaks with admiration and astonishment of the old architectural remains of a long-past time which are to be seen in the ancient Hansa town of Wirby, and other points of the island. Some of these are undoubtedly worth sketching, and if any of your own readers should be tempted thither this autumn, they might do worse than give us the benefit of their travels in your pages.

Clubland is closing for repairs. The Athenæum will probably complete this year its scheme of redecoration which has been in progress since 1891. Three years ago a committee of artists, which included Alma Tadema, E. J. Poynter, and Arthur Lucas, supervised the first part of an extensive scheme of ornamentation, the entrance hall and grand staircase being the scene of operations. In 1892 the rooms on the ground floor were taken in hand, and last autumn the workmen were engaged on the first floor. The chief designs have, so far, been furnished by Mr. Tadema and Mr. Poynter, the former being responsible for the decorations in the hall and on the staircase, and the latter furnishing ideas for the coffee-room and the morning-room.

No one is better qualified to appeal for the preservation of the Berkshire White Horse than Judge Tom Hughes, whose delightful book on "The Scouring of the White Horse" is familiar to most schoolboys. This figure, which was formerly more conspicuous than at present to passengers on the Great Western main system between Didcot and Swindon Junction, is cut in the hillside at Uffington, to the south of the railway, and the steed, made by removing the turf so as to show the chalk beneath, is 355ft. from nose to tail and 120ft. from ear to heel. It is traditionally said to have been made to commemorate the victory of Alfred at the battle of Ashdown; but in the opinion of Tom Hughes it is of much older date. Whatever may be its origin, it has a recorded existence of eight centuries. The Judge pleads that efforts should be made to preserve this, the last of the Saxon White Horses. After the last scouring it was understood that Earl Craven undertook to keep the old figure fresh and clean; but since the passing of the Ancient Monuments Act the family seems to have left the duty to the nation. Anyway, the figure is sadly overgrown with weeds, and can be made out only with difficulty from the Vale of Stanford, although it is alleged locally that a ten-pound note would cover the entire cost of scouring.

The Uffington figure, although the oldest and best known, is not, of course, the only extant specimen of its race. There are other "White Horses" at Westbury, Cherhill, Marlborough, Pewsey, Broad Hinton, and Wootton Basset. Yorkshire has two of modern date. There are a horse and a stag on Mormond Hill, in Aberdeenshire. At Tysoe, in Warwickshire, there is a Red Horse. Weymouth has a very crude hillside picture of George III. on horseback. There is a human figure at Cerne Abbas which is known as "The Giant," and at Wilmington is a still larger one which is called "The Long Man."

Canon Wilberforce, who has recently moved into one of the old buildings in Dean's-yard, Westminster, has unearthed some interesting old frescoes, the existence of which was suspected ten years since, when the discovery of a panel painted on tempera was made in one of the rooms, hidden under a substratum of plaster. Two sides of a large room have been laid bare, and frescoes of great beauty brought to light. Each panel is about 14in. wide, divided by oak studs arranged vertically. Much of the design consists of scroll-work, while the "hippocampus," or grotesque little Mediterranean fish, is of frequent occurrence. Over the fireplace there is a design somewhat resembling a coat of arms. Two pillars, surmounted by the triangle of Freemasonry, inclose a sort of shield, upon which is emblazoned *fleur-de-lys*. The painting is most likely of the time of Henry VII., and may have been the work of some Italians brought over from Rome by Abbot Littlington, when he went to do homage to the Pope for his abbacy in 1350. A third wall of the same apartment is panelled in oak, 500 years old. In the basement is a range of cellars used for wine and coal. The canon has knocked down the party-walls, cleared away 40 loads of rubbish out of the floor, and dug down through the front hall into an old archway of the date of Henry VII. The original roof built by Nicholas Littlington in 1362 has rewarded his efforts. The groins and roses are as crisp and fresh as on the day they were carved, and the actual paint laid on the roses by the monks more than five hundred years ago is still plainly visible. The crypt, erstwhile coal and wine cellar, is now perhaps the most unique dining-room in London.

According to the *Australasian Builder*, several of the English railway companies propose to try the New South Wales hardwood sleepers. The Great Eastern Railway Co. has agreed, it states, to lay down 1,000 iron-bark sleepers, and the London, Brighton, and South Coast Company have ordered 2,000 red-gum sleepers. The sleepers are being shipped for their destination, and the agricultural department of the colony is arranging for the supply. With regard to the iron-bark sleepers, the railway company wanted them delivered on their trucks at 5s. each; but it was found impossible to deliver them at that price. The department has accordingly agreed to pay the extra cost from the ship's slings to the railway trucks. The red gum sleepers cannot be delivered for less than 6s. each. No doubt it will be worth the colonial department's efforts to introduce the hardwoods of the colony into this country, and there can be no doubt the railway companies will find it to their advantage to use ironbark or red gum instead of the perishable fir timber now put down.

For some years past the architects in private practice in the United States have been chafing under the rule by which all buildings erected for the Government are carried out from plans prepared in the department of the supervising architect to the Treasury. A Bill has now been introduced into Congress providing that this state of affairs shall be altered, and authorising the secretary, in his discretion, to obtain plans and specifications and local supervision for its public buildings by the system of competition among private architects. While not mandatory, it authorises the secretary to employ the architect whose plans are approved, to superintend the construction. The compensation of such architect will be determined, as in private employment, on fixed commission on the cost of the work. The measure does not take from the supervising architect any of the functions or authority belonging to the office which, under existing conditions, he performs. He will still, as now, retain general supervision and control of the work. He will remain and continue the representative of the Government in all matters connected with the erection and completion of the buildings, the receipt of proposals, the award of contracts therefor, and the disbursement of money thereunder, and perform all the duties that now pertain to his office, except the designing and preparation of drawings and specifications for such buildings, and the local supervision of the construction, and such drawings and specifications shall be subject to his approval and to modification by him. In fact, this measure is intended to make him what the title of his office indicates, the supervisor of architects; not the Government's architect, but the supervisor of the architects of the Government's works.

The House Committee on Public Buildings and Grounds has just made a unanimous and favourable report on the Bill, which is favourably regarded in both Houses of Congress, and stands a good chance of being passed. The Bill is virtually one drawn up by a committee acting in conjunction with the American Institute of Architects, and modified on the recommendation of the Committee on Public Buildings and Grounds. Its importance to the architectural profession in America may be apprised from the fact that according to the official returns, the United States Government has at this date nearly 300 public buildings in the various stages of progress, of planning and construction, all under the supervision and control of the Supervising Architect of the Treasury, and from 50 to 60 new buildings are authorised to be constructed by each congress. The committee report that while private works show a constant progress in methods of construction, equipment and artistic expression, accompanied by a continual increase in economy of construction, in the case of the buildings for the Government, there has been but little, if any, advance upon methods of construction or equipment in recent years; "in fact, the buildings constructed recently by the United States, as compared with those constructed a quarter of a century ago, show a marked deterioration of artistic quality; that, despite the marked inferiority of the typical Government buildings, the cost has been relatively and positively much greater than that of private buildings of the best type.' Further the committee has been furnished reliable and trustworthy information and data, showing that the cost of the best types of buildings constructed for States, municipalities, corporations, and private citizens ranges from 38 to 50 cents per cubic foot of space, while the cost of the buildings constructed by the United States ranges from 50 cents to one dollar per cubic foot.

The committee point out that owing to the steady and vast increase of department work since the office of supervising architect was established, that official cannot himself design and make original plans for each new building; but they are necessarily prepared by clerks, who utilise the drawings and specifications originally made for one locality for any other of like size, regardless of the varying climate and geological conditions, thus involving wanton wastefulness of expenditure, and absolutely precluding the possibility of progress in architectural design. The supervising architect, it is demonstrated, rarely if ever sees one of these buildings while in course of erection. Its construction is generally under the supervision of some local carpenter or builder who never made any pretence to architectural knowledge or study, and whose appointment was secured, not because of his skill or knowledge of the work, but because of the political influence he could marshal to secure him employment, and whose greatest solicitude is to prolong the tenure of his employment by delaying the completion of the work. Another very serious evil resulting from the system and methods now employed in the States relating to the construction of public buildings, to which the committee call attention, is the length of time required to construct and complete one of these buildings. "A building which, if the property of a private citizen, would be constructed in months, when erected by the Government requires years for its completion. This necessarily results in great wastefulness and loss of money to the Government by the payment of unnecessary salaries of superintendents and other agents, by the expense of watching and caring for the materials and structure, and by the loss, waste, and deterioration of such material, besides the inconvenience to the citizens resulting from such delayed construction. From three years upward is the time employed in constructing a building that a private citizen or a corporation would complete in one year or less." The abuses under this system have indeed become so serious that the committee can not conscientiously recommend public buildings at many places where the business would justify such buildings could they be provided at a cost not greatly exceeding the necessary expenditure by a private owner for similar purposes.

The assistant engineer in India is, according to *Indian Engineering*, getting into disrepute. Great dissatisfaction is springing up in the Punjab over some recent appointments of so-called "temporary engineers." These temporary engineers are largely employed in the Punjab irrigation works. The older hands, properly trained and qualified engineers, feel aggrieved, and rightly, at the increase of temporary men, who are often unqualified men, and one correspondent says fully 50 per cent. of them are completely out of place. One of these gentlemen, it is said, could not work out a common cube, and at different times filled the occupations of a sailor and a jockey. These "impostors" and "loafers" are said to abound, much to the detriment of individuals who entered the service 20 years ago, and on very different terms. Much disgust is felt over the appointments made. Is the Government of India to blame?

The State of Minnesota have not behaved very liberally to architects in their invitation for plans of the proposed Capitol building for that State. According to the *Engineering Record*, the statute creating the Board of State Capitol Commissioners directs the latter to invite competitive plans and specifications for a building which, it is thought, will take ten years to complete, but for which no compensation is offered in the usual way. It seems that the Capitol Act provides that the Board shall appoint a "suitable person" to superintend the erection of the building, whose duty is to begin after the contract is let, and who shall be paid a "reasonable compensation to be established by the board." The accepted design is to remain the 'property of the architect, and shall not be used in whole or in part, except said architect is employed as architect and superintendent, and the fee is not to exceed 2½ per cent. of the amount named in said Bill, which means that the State is to pay nothing for the design, but only the supervision of the building. No premium is to be paid other than the fee allowed for designing and superintending. The Minnesota Chapter of the American Institute has taken objection to this unusual proceeding, and urges that the architect be employed for full professional services, and receive compensation for his design and superintendence separately.

OBITUARY.

We regret to announce the death, at the age of 72 years, of Mr. Wyatt Papworth, F.R.I.B.A., the genial and accomplished curator of Sir John Soane's Museum. Mr. Papworth, whose portrait was given in the Building News for June 6, 1890, represented in the third generation the traditions of the architectural profession, as his grandfather was one of the architects, builders, and decorative plasterers of the closing years of the 18th century. Beginning life in the service of the Commissioners of Sewers for Westminster, one of the predecessors of the London County Council, the late Mr. Papworth won the Institute Medal in 1849, and afterwards became surveyor to the Alliance Fire Assurance Company. His works as an architect include the Junior Army and Navy Club and the Alliance Office at Ipswich. It was, however, as a voluminous and painstaking writer on the bibliography of architecture, its classics and archæology, that Mr. Papworth will be longest remembered. His chief monument will be the exhaustive but unwieldy "Dictionary of Architecture," a work begun so far back as 1852, on the lines of the notes and collections of himself and his late brother, John Wyatt Papworth, by the Architectural Publication Society, and carried out until its completion in eight folio volumes in 1892, under his sole editorship. In 1864 Messrs. Longmans intrusted to Mr. Papworth the editorship of a revised edition of Gwilt's Encyclopædia, and all the editions since issued have been brought out under his supervision. He was a constant contributor to *Notes and Queries*, and to the *Journal* of the R.I.B.A. Among the many papers of permanent value and interest read before the Institute of Architects may be mentioned those "On the Superintendents of English Buildings in the Middle Ages, with especial reference to William of Wykeham," and "Collections for an Historical Account of Masons, their Customs and Institutions." Mr. Papworth was one of the senior members of the Institute of Architects, having joined as one of the former class of Life Fellows in 1860; he had served four or five terms as a Member of Council, was re-elected to that office last May, and also rendered good service in connection with the library, which was enlarged, arranged, and catalogued by him on the removal to Conduit-street in 1860. He was also interested in the work in aid of technical education of the Clothworkers' Company, and served as Master in 1889-90. Last November he presented a large architectural painting, representing a columned Classical interior, by Emmanuel de Witte, to the permanent collection of the City Art Gallery at the Guildhall. In December, 1892, on the death of Mr. James W. Wyld, he was elected as curator of the Soane Museum, an eminently felicitous choice, and he may be said to have died in harness, for it was at the Museum he succumbed to paralysis, after six weeks' illness, on Sunday last. He is survived by his wife, two sons, and a daughter. The funeral took place yesterday (Thursday) at Highgate Cemetery.

Franz Schmitz, the cathedral architect at Cologne, died at Baden-Baden on the 8th inst., aged 62 years. His father was the master mason employed upon Cologne Cathedral, and from 1852 to 1868 the son's whole time was occupied with designs for the details of the cathedral, and when his master, the then Dombaumeister, Professor Friedrich von Schmidt, died, Franz Schmitz was appointed to succeed him. The two towers at the west end of the completed cathedral are his work. He was employed in the restoration of mediæval works all over Germany, and there are numerous churches built after his designs. In 1867 the highest prize for architectural works was allotted to him at the Paris Exhibition. On the death of Hortel in 1890, he was appointed cathedral architect at Strasbourg, where he carried out the restoration of the west front of the cathedral.

Mr. Charles Liddell, the chief engineer and surveyor of the Metropolitan Railway, of Abingdon-street, Westminster, who died on the 10th inst., at the age of 81, was a brother of the lately retired Dean of Christ Church. He was a pupil of George Stephenson's, and from that time till a few weeks before his death was actively employed in the construction of railways, principally in the United Kingdom. Under George Stephenson, Mr. Liddell superintended the making of the Birmingham and Derby Railway, that of the Grand Junction, and the line from Rugby to London. In conjunction with Robert Stephenson he constructed the Leicester and Swannington Railway, the system to Peterborough, and the Rugby and Stamford Railway. He, with his then partner, Mr. L. D. B. Gordon, was subsequently engineer-in-chief, of the Newport-Hereford and Abergavenny Railway, and the extension of the Taff Vale with the Aberdare branch. About a dozen other lines were constructed by Mr. Liddell in England and Wales, as well as the Danube and Black Sea Railway in Turkey, and the Novara and Lake Orta Railway in Italy. Only a few months since Mr. Liddell completed the extension of the Metropolitan Railway to Aylesbury, and a few weeks since he completed that of the Manchester, Sheffield, and Lincolnshire to Nottingham through the heart of the Derbyshire coalfield. He also laid out the extension into London of the latter line. As a partner in the firm of R. S. Newall and Co., wire-rope makers, Mr. Liddell took an active part in laying submarine telegraph cables. He laid a cable between Varna and Balaclava.

CHIPS.

The Glasgow school board rejected, on Monday, by seven votes to five, a motion to the effect that in all specifications issued by the board inviting tenders a clause should be inserted binding contractors to pay not less than the standard rate of wages. The chairman, in moving the "previous question," stated that the board did not deal with unfair contractors. Their system in giving out contracts was to invite ten or a dozen firms of good standing and repute to tender, and then the lowest offer was accepted.

Mr. E. G. Jones, late assistant engineer to the St. James's and Pall Mall Electric Light Company, has been appointed electrical engineer to the corporation of Cape Town.

A new public clock has been placed in the tower of Stanhope parish church, near Darlington. The clock, which was made and fixed by Messrs. William Potts and Sons, of Leeds and Newcastle, was formally started on Sunday.

The Jubilee art loan exhibition of pictures at Peel Park Museum, Salford, was finally closed on Sunday. Since its opening on April 16, it has been visited by 123,156 people.

The Turkish Ministry of Public Works have determined upon the reconstruction of the ancient water conduits of Jerusalem, dating from the age of King Solomon. The new conduits are to be joined to the ancient aqueducts of Arob, and are to be carried through a tunnel 11,550ft. in length. the total outlay in connection with these works is estimated at £80,000 sterling.

The almshouses at Tregony, belonging to the Boscawen Charity, are about to be reconstructed on the present site, from plans by Mr. Silvanus Trevail, of Truro.

In the case of William Horrox, of Levenshulme, Lancashire, a discharge from bankruptcy has been granted conditionally.

The town council of Aberdeen discussed on Monday a recommendation by their public health committee, that Exchequer-row, a densely-populated locality which had been condemned by the medical officer of health, should be declared to be an unhealthy area under the provisions of Part I. of the Housing of the Working Classes Act. Although the opponents of the scheme declared that the reconstruction would cost £50,000, the recommendation of the committee was adopted by eighteen votes to seven.

At Wolverhampton on Wednesday, William Backhouse, a carpenter on strike, was sentenced to one month's imprisonment, in default of paying a fine and costs, amounting to £4 15s., for what the stipendiary termed "the serious offence of intimidating a non-society workman, and depriving him by a trick of the use of his tools."

The first piece of turf for the East Glamorgan Railway—a line to connect Barry Dock with the Ogmore Valley—was cut on Monday by Mrs. Szlumper, wife of the resident engineer. The new line will give a direct connection between the coalfields of the Ogmore Valley and Barry Dock.

In addition to the monument to Professor Jowett which is to be placed in Balliol College Chapel, a marble bust will be presented to the University of Oxford on behalf of the subscribers to the fund. This work has been intrusted to Mr. H. Pinker. The bust will be placed on a pedestal of Sienna marble in the Bodleian Gallery.

Opening services were concluded on the 19th inst. in connection with restorations to the United Methodist Free Church, chapel, and school, at Britannia, near Bacup, which was destroyed by fire in October, 1892. The work has been carried out under the supervision of Mr. F. E. Bolshaw, architect, of Southport and Crewe, at a cost of £1,500.

Building Intelligence.

Bridlington.—The Roman Catholic Church, Bridlington, which was opened yesterday, has been designed by and carried out under the superintendence of Messrs. Smith, Broderick, and Lowther, architects, Hull. The church is in an Early style of Gothic architecture, and consists of a nave 54ft. long by 17ft. wide, with north and south aisles 8ft. wide, and at the end of each aisle is a side chapel: one is dedicated to the Sacred Heart and the other to the Blessed Virgin. Each chapel has above the altar and at the sides beautiful traceried stone windows, which have been filled in with stained glass; the roofs are groined with the best selected pitch-pine boards and moulded ribs, which terminate with a carved boss. The sanctuary is 20ft. in length and 17ft. in width, and has an octagonal apse with traceried stone windows, and is divided from the nave by lofty arches resting on clustered shafts of polished Derbyshire marble, and capitals richly carved in Early English foliage and moulded bands and bases. The arches separating the sanctuary from the side chapel are filled in with traceried oak screens. The nave is divided on either side from the aisles by arcades of four moulded bays, with moulded arches on octagonal shafts of Hopton wood polished stone, and moulded caps and bases. The nave has a clerestory of lancet-headed windows, and the aisles are also lighted by similar shaped windows. The choir gallery is at the west end above the main entrance, with an organ-chamber at one side. The west front of the church is the most prominent feature, it is built of the best red stock bricks and stone dressings, and the massive angle buttresses terminate in lofty pinnacles of stone. A long two-light traceried window and a single-light one on either side fill the gable above the western entrance. Stone-carved niches are fixed between the centre and side windows for statues of the patron saints. The gable is coped with moulded stone, and the apex is a finely-worked cross. There is a large working and private sacristy, and in a recess in the aisle wall is the confessional. A large heating-chamber is formed below the sacristy for a high-pressure heating apparatus. The accommodation provides for about 300 adults. The contract was let to Mr. John Rennard at £1,870. Mr. Bayart, of Bruges, has executed the oak stalls and screens, and Mr. Ebner the whole of the marble terrazzo floors. Mr. Frith, of Hull, has executed the stone carving, and the stone altar in the Lady Chapel is also his work.

Castle Bromwich.—A new racecourse is being provided for the citizens of Birmingham at Castle Bromwich, about 3½ miles from the centre of the city. The engineering work is being rapidly pushed forward, and the first races will take place next Easter. Upwards of 300 men are now engaged in building and carpentering operations, draining and levelling, tree-felling, road-making, and constructing a 35ft. waterway, into which the River Tame is to be diverted. The whole of the work is being carried out by Mr. W. Hopkins, Thorp-street, Birmingham, whose contract price was £27,200; the architects are Messrs. Owen and Ward, Colmore-row; and the clerk of the works is Mr. H. Preece. A piece of land has been acquired by the Midland Railway Company near by, which may be utilised for a new station. Bromford-lane, from the railway bridge, is to be widened to 53ft. for a distance southward of about 300yds., to the principal entrance. Here there will be a caretaker's house, with a recreation-room, dormitories, and offices, the whole block being 74ft. long, 17ft. deep, and three stories high. On the right and left of the house will be loose-boxes, and on the opposite side of the 35ft. yard will be other loose-boxes, accommodation being found in all for 64 horses. Each box will be 12ft. square. At the rear of the stabling will be the paddocks. The entire length of the course is 2 miles 4 furlongs. The grand stand will be of wood, with glass sides. It will be 250ft. long, 56ft. deep, and, with 14 tiers of seats extending from end to end, will accommodate upwards of 4,000 people. Immediately in front a lawn will be laid out, and Tattersall's inclosures will be provided. To the right of the grand stand is the public stand, the dimensions being 200ft. long and 32ft. deep. The 14 tiers of seats will provide space for nearly 3,000 people. The space underneath the two great stands will be converted into refreshment-rooms. A serious item in engineering is the diversion of the course of the River Tame, which at present winds in and out through a portion of the track. The river in other portions of the land acquired, will be widened, so as to avoid flooding. Extensive draining works are being carried out, and a great deal of levelling will have to be done. At the Bromford end of the land the river bed will be widened by 15ft. for a considerable distance, and through the Corporation sewage farm. Lower down the river again runs under the railway and crosses the "gallop," and it is at this point that its course will be diverted, and the old waterway filled up. The diverted river channel will be led close to the railway for a distance of over 2,000ft. towards Castle Bromwich Station, and will be 35ft. wide and 6ft. deep.

Edinburgh.—The Chancelot Roller Flour Mills, on the northern boundary of the city, erected by the Scottish Co-operative Wholesale Society, will be formally opened to-morrow (Saturday). The frontage to Dalmeny-road has a length of 328ft. It is of Classic design, boldly treated—the façade being broken up by four pilastered bays, surmounted by a domical roof, finished by iron cresting. The central tower, 42ft. square at the base, rises to a height of 185ft. It shows at the angles clusters of pilasters and pinnacles; the four clock faces are placed in a series of moulded dormers surmounted by a sheaf of wheat, and crowning all is a high-pitched conical roof, terminating in a platform surrounded by a massive iron crest, into which are worked the monogram of the society and the Scottish thistle. An open balustrade is carried right round the wall-head of the mill, save where the bays and towers intervene; and a similar balustrade adorns the wall-head of the plainer warehouse block behind. To the east of the tower is the engine-house, 61ft. by 35ft. and 27ft. high. The whole of the buildings are built of stone, the walls are 2ft. 6in. thick at the base, and internally are plastered with Portland cement and Keen's cement, which gives to them a hard white surface. The mill has been fitted up with plant capable of turning out 25 sacks per hour, and is fitted up with Symon's roller plant. The front building is of five stories, and is 65ft. in height to the wall-head. The different floors vary from 14ft. 6in. to 12ft. 6in. in height. To the north of the mill, and separated from it by a courtyard 40ft. in width, is a range of warehouses, six stories in height; and to the north of the silo-house are workshops for mechanics, the boiler-house, and chimney-stalk, which rises as a Doric column with grilled top to a height of 215ft. The total cost of the buildings and their equipments will be about £100,000. The designs were by the late Mr. James Simpson, burgh assessor and architect, Leith; and since his death the work has been carried out by his son, Mr. George Simpson, who also succeeded his father in his civic appointment. The whole of the masonry was built without the intervention of contractors, and, on an average, between 200 and 300 masons and labourers were employed upon it. Part of the work, however, had to be contracted for—such as the malleable ironwork by Redpath, Brown and Co.; the cast-iron work, by Mackenzie Brothers; the slater work, by Maclean and Reid; and the glazier work, by Dickson and Walker. The society's clerk of works was Mr. Davidson.

Folkton.—The parish church of Folkton, near Scarborough, is now being partially restored. The works which are now being carried out are the repairs of the masonry of the inside of the church, and also of the walls. The floor of the church is being lowered to its original level, and the alleys repaired with rubbed flags, the floor of the sacrarium being tiled. The nave of the church will be seated with open benches, and stalls are being placed in the chancel, and new altar rails and standards, and there is to be a new pulpit. The wood windows on the south side have been replaced with stone ones of 15th-century character, and a new door is also to be placed on this side of the church. The whole of the works are under the superintendence of Messrs. Smith, Brodrick, and Lowther, architects, of Hull, and the contract is being carried out by Mr. R. Kilvington, of Nafferton, and Mr. Rudd, of Driffield.

Leeds.—The new premises of the Yorkshire Penny Bank were formally opened by the Duke of Devonshire on Friday. The building, which has been designed by Mr. G. B. Bulmer, F.R.I.B.A., of Messrs. Perkin and Bulmer, Leeds, is treated in a bold Domestic Gothic style. It adjoins the new Post-office, and has a frontage to Toronto-street of 115ft., and to Infirmary-street of 103ft., while at the angle a tower, finished with pyramidal roof, rises to a height of 120ft. The bank proper is 90ft. by 40ft. A series of arches with carved stone caps and bases run around the room, those to the front and rear inclosing the windows, while the corresponding spaces on the side walls are filled in with marble, and the spandrels between the arches with marble mosaic. The floor space in front of the public counter is laid with marble mosaic, the floor being laid with wood blocks, and the ceiling panelled with fibrous plaster. The desks, counters, and wall panelling are of oak. At the far end of the room is a hydraulic lift, which carries the ledgers down to a vault. The manager's room is panelled with oak, and adjoins a strong room, constructed of steel plates and steel rails in cement. On the other side of the public office are the sub-manager's room and the inspector's room. The board-room is 53ft. 6in. by 24ft. The walls are panelled with a dado of English oak, the space above being lined with Sienna marble. The floor is laid with parquetry. Facing the entrance is a fireplace, carried out in Hopton Wood stone and alabaster, and inclosing a grate of wrought-iron and hammered copper. On either side of the mantelpiece are large panels in bronze, containing portraits of Colonel Akroyd and Mr. Peter Bent. The premises are lighted throughout with electricity, the electroliers being of wrought-iron, with copper enrichments. The two upper floors are laid out in suites of offices, approached by a stone staircase in the tower, and also by a hydraulic passenger lift. The building, which throughout is constructed as far as possible of fireproof material, has cost £50,000, and has occupied about three years in erection. Messrs. Nicholson and Sons, of Leeds, were the general contractors. The marble and mosaic work has been provided by Messrs. Pattison and Sons, of Manchester; and the coloured glass by Messrs. Powell Brothers, of Leeds. Mr. J. E. Brotherton was the clerk of works.

Newcastle-on-Tyne.—During the alterations which are now being made in the Trinity Chapel, or De Athol Chantry, of St. Andrew's Church, Newcastle, some of the old walls have had to be removed, to enable the chantry to be re-constructed in its original design. In removing one of the old pillars, the basin of a holy-water stoup has been discovered built into the wall. It is evidently of the same period as the piscina yet preserved in the south wall of the chancel. Several chiselled stones, small shafts of pillars, and masons' marks have also been discovered, which have been carefully preserved by the architect, Mr. W. S. Hicks, of Grainger-street, Newcastle. The east window of the De Athol Chantry has never before been opened out, and the rich design of its flowing quatrefoils have now been brought to light. The large north window has also been cleared of thick obscured glass. The ancient monuments have now been replaced in their respective positions, with the addition of the two tombstones which for many years stood outside against the south wall of the tower.

Oxford.—The City Technical School in Church-street, St. Ebbs's, was opened on Tuesday week. The building has been erected on a site previously occupied, partly by the Bluecoat School and partly by cottages. The cost, including fittings, has been about £4,500. The front elevation consists partly of the old schoolhouse and partly of new work, the latter being of red Headington bricks, with dressings of Box Ground freestone, and gabled. The front of the old school-house is also gabled to match. The main gateway leads through a wide arched corridor into a yard. From this corridor there are entrances on the right hand and on the left to the various classrooms, and also to the caretaker's rooms. On the north side of the yard are the workshops for the wood and metal departments. The department for science students consists of three rooms, a lecture room, a chemical and physical laboratory, and a master's room. The department for art students includes a room, 52ft. by 22ft., also two class rooms, together with a master's room. The art rooms are on the first floor of the new buildings; on the ground floor of the same is a corridor opening into three large class rooms. The buildings are heated by hot water, the boiler and storage rooms being in the basement below. The architect is Mr. H. W. Moore, the builder, Mr. Charles Curtis; and the clerk of the works, Mr. R. England.

Correspondence.

TOMBSTONES.

To the Editor of the Building News.

Sir,—Referring to Mr. E. E. Minton's letter under the above heading, the late Rev. Ed. L. Cutts' "Manual for the Study of the Sepulchral Slabs and Crosses of the Middle Ages" (1849), published by Parker, used to be almost the only book of the sort one could readily fall back upon. But, in "Ancient Sepulchral Monuments," by Messrs. Brindley and Weatherley (1887), printed for the authors by Vincent Brooks, Day, and Son, are measured illustrations of over 600 examples, dating from the times of Queen Cleopatra, right through to the latter days of Old Bunhill Fields Burial Ground. With this book at one's elbow, no man, young or old, can go wrong, and if it were appreciated as it ought to be, it would do more to educate the monumental mason than all the rest of the works on the same subject ever written.

I remember that after the fatal theatre fire here in 1887, when something like 200 unfortunate persons were consumed alive, it was proposed by the Fire Relief Committee to erect a memorial in the Exeter Cemetery. Some local sculptors were asked to prepare suggestive designs, and amongst them myself. Soon afterwards the committee called at my studios, and General Freemantle, who happened to be the spokesman, said, "Mr. Hems, the committee are unanimous in considering your design the best." "Indeed, General," I answered, briskly; "it is no design of mine: it is simply a replica of an old Celtic cross in Ireland, which you will see, drawn to scale, in *Ancient Sepulchral Monuments*," producing the work just referred to, "and," I added, "I would propose that the work be carried out in the selfsame material—Ballinasloe limestone. It is only reasonable to believe that a duplicate of what has already stood nearly 2,000 years will, in itself, stand just so long into futurity."

And so the cross (illustrated in the Building News, January 17, 1890) was put in hand, and is, I hope, a credit to its day and generation.

The cost of *Ancient Sepulchral Monuments* is three guineas, and for all practical purposes it would be cheap at double, yea treble, the money. —I am, &c., Harry Hems.

Fair Park, Exeter, Aug. 17.

NEW ESPLANADE AT WEST COWES.

Sir,—In last Friday's issue of your valuable paper, I observe you kindly make note of our new esplanade works, but the length is not quite correct. The Local Board of West Cowes have completed their section, terminating at the district boundary, which gives a length of 210 yards, the cost of which I estimated at £2,300. The Ward Estate commenced their section from the district boundary, and have already constructed a length of 250 yards. This does not, however, represent the total length of the work, for it is still being continued in the direction of Gurnard. The whole of the undertaking is being carried out under my supervision, and without the intervention of a contractor, and, I am pleased to say, well within the estimate in both cases.—I am, &c., Nelson F. Dennis, A.M.I.C.E.

Town Surveyor's Offices, West Cowes,
August 18th.

VENTILATION OF SEWERS.

Sir,—I have devoted much attention to this subject with a view to discover a convenient means by which actual demonstration may be obtained of the principal facts involved in organic reactions in sewer air and their relations to certain forms of disease. It will, I think, be admitted that demonstrations of this nature might properly be carried out by the State in the public interest; but should any medical officer desire to test the facts, I will gladly give every information regarding the appliance required.

My attention was very practically drawn to the subject between 1878-86 from experiencing the aërobic effects produced by aërating sewage and other liquors containing organic impurity. The general conclusion arrived at was that within certain limits of time the reactions, though offensive, are both normal and innocuous in effect, whilst the reactions which result from fermenting sewage, operate with a totally different effect. Acting on this experience, early in 1892 I ventured to suggest to the M.D.L.B. that the latter form of reaction formed "the chief factor" in the course of a then prevalent form of zymotic disease, and a subsequent official inquiry by the board attributed the malady chiefly to the presence of refractory organic impurities in the air.

It is obvious these obscure reactions and the results, whether occurring in the sewer or in the open air, must of necessity be governed by the operation of the principles of time, temperature, and movement in air or oxygen supply; and as much light was thrown on the subject by Dr. Frankland, F.R.S., at last year's congress of the B.A., by giving observed results with organisms exposed to similar conditions which operate in sewers, the following conclusions advanced by the authority named, and which cover the subject of sewer air, may prove interesting and instructive by drawing attention to the vastly important issues involved:—

By educational culture the character of an organism may be quite changed; on the other hand, the virulence can be increased, although *as yet* no pathogenic organism has been raised from non-pathogenic; but as similar *modification processes* "evidently" go on in nature, we must grant that bacilli acquire new characteristics under new conditions. (Extract from a paper, "Bacteriology," by Dr. Percy Frankland, F.R.S., B.A. Congress, 1893.)

We have real anthrax, and an exceedingly similar innocuous modification, both occurring in the soil; *many toxic* forms — cholera, typhus, diphtheria bacilli have *pseudo* forms. In certain cases the modification may be due to the exclusion or exhaustion of oxygen. Assuming aërobic fermentation in presence of air to be normal, as in the early days of Pasteur, then a modified reaction can apparently proceed when no more oxygen is at disposal.

In conclusion, I would like to say that the above important conclusions show that an actual demonstration of the facts involved in sewer emanations must of necessity go much deeper than discovery of typhoid or diphtheria organisms in sewer air itself.

As regards Bristol being quoted as free from typhoid, I suggest the cause lies in the fact that the natural conditions limit the reactions to practically the normal innocuous stage. In fact, Bristol in a measure indicates the procedure required in inland towns; in the former case the sea water continuously dissipates and neutralises the material on which the modification reactions apparently proceed, whilst in the latter case continuous destruction of the same elements by fire would produce still happier results.—I am, &c.,

Hill-Hartland.

728, Grimesthorpe-road, Sheffield, Aug. 20.

Sir, — In reference to the correspondence connected with the above subject, I think the suggestion made by one of the members some time since at the Conference of Sanitary Engineers was the best - viz., to insist upon each houseowner putting in an earthenware ventilating pipe from the sewer side of the disconnecting trap or manhole, and run this backwards to the house attached to a 4in. iron ventilating pipe running up above the roof.

This iron ventilating pipe could also be made to act as the ventilator of the house-drains as well, if it be placed in a position at the head of such drains, which it could be. By this means there would be no need to abolish the disconnecting traps or manholes, cutting off sewer from house-drains; the sewer smell or gases would not go up the soil-pipe, and so run the risk of entering house through defective traps, and there would be no need for ventilating grating in the street.

By this means each house would assist in ventilating the sewers with more effect than the present grating, at the same time without fear of bad smells entering the house through defective traps attached to either water-closets or sinks.

I think, as sewers are made for the benefit of the public, the latter should contribute to the ventilation thereof, providing a system can be devised by which all risk of bad air entering the house is avoided, and I think the above would effect this.

Should the above iron pipe be used to ventilate the house-drains as well, it would be necessary to trap the bottom of all soil-pipes, which would be a still greater security against bad smells entering the houses.—I am, &c.,

James N. Crofts, Architect.

5, Harrington-street, Liverpool, Aug. 22.

Intercommunication.

QUESTIONS.

[11201.]—**Lightning Conductor.**—We have lately had a conductor fixed on a chimney stack on a building in a very exposed situation. The top of the fork is about 6in. above the chimney pots, and appears to us too low (the stack is about 6ft. by 2ft.) Will some reader kindly inform us of a rule to guide as to height, and the amount of a building protected by each conductor?—R. S.

REPLIES.

[11194.] — **Testing Drains.** — Under the Public Health (London) Act, 1891, the sanitary authority have power to inspect premises and to abate nuisances, and they can undoubtedly cause a drain to be tested that may be considered "injurious or dangerous to health." There is no uniform rule as to testing. Some authorities exercise the power, but not all, though it is evident if a careful inspection has to be made testing becomes a necessity. I know that some of the London vestries require the drains to be tested; others certainly do not.—G. H. G.

[11198.]—**Nene Valley Churches.**—What affinity there may be between Greek temples, "whether in existence or passed away," and the Nene Valley churches, "Student" probably only knows! If, however, he wants to know all about these interesting churches prior to visiting them, he should procure "The Churches of the Nene Valley, Northamptonshire," by Edmund Sharpe, M.A., and J. Johnson and A. H. Kersey, architects, published by Batsford (1880). This capital book contains 112 full-size plates (1ft. 2¾in. by 10½in.), giving measured details from 46 different churches in the Nene Valley. They embrace St. Peter's, Aldwinkle; All Saints, ditto; All Saints, Stamford; Bainton, Barnack, St. Andrew's, Barnwell; Brasenose College, Stamford; Castle Ashby, Cogenhoe, Denford, Earl's Barton, Etton, Finedon, Fotheringhay, Helpstone, Higham Ferrars (when I helped to restore this church in 1863, under the late Mr. Slater, architect, the place used to be written Higham Ferrers!), Irchester, Irthlingborough, Islip, Lowick, Market Deeping, Northborough, Oundle, Polebrook, Raunds, Kingstead, Rusden, St. James's, Deeping; St. John's, Stamford; St. Leonard's Priory, Stamford; St. Martin's, ditto; St. Mary's, ditto; St. Paul's, ditto; St. Peter's, Northampton; St. Sepulchre's, ditto; Stanwick, Tansor, Tallington, Titchmarsh, Uffington, Warmington, Wellingborough, West Deeping, Whiston, and Woodford. Writing the names of these fine old churches recalls many bright memories, for I have been personally associated with work at fully half of them; and the happy recollections are tinged with some sorrowful ones, too, for the best of those with whom I was so closely allied in the various works in question have, nearly all of them, gone to their rest. *R.I.P.*—Harry Hems.

[11200.]—**Hollow Walls.**—I fully agree with the excerpt quoted by "Perplexed" from the Building News—viz., that a hollow space or wall with a cavity in it is much more soundproof than one of solid material; but if the hollow space be closely packed with silicate cotton, the transmission of sound will be entirely stopped. This method was adopted by Mr. Knightly, the architect, in the erection of Queen's Hall, Langham-place, W., with the most perfect result.—J. Christie.

[11200.]—**Hollow Walls.**—It is quite true that a hollow wall is better than a solid one in checking the passage of sound through it, but a 10in. wall with two half-brick thicknesses and an inch cavity is scarcely thick enough to prevent the transmission of sound. I have generally preferred a 16in. wall made up of a 9in. and 4½in. thicknesses, the latter inside, and 2½in. cavity. The inch cavity is probably filled up by mortar droppings or timber which accounts for the sound passing.—G. H. G.

CHIPS.

The parish church of Alsager is being rebuilt, and is making satisfactory progress. Mr. Fielding, of Alton, Staffs, is the contractor.

The Jewish Synagogue in Belgrave-street, Leeds, after having been entirely renovated under the supervision of Mr. Henry Perkin, F.R.I.B.A. (of the firm of Messrs. Perkin and Bulmer), was reopened on Friday. The interior of the building has been decorated by Mr. George Hall, Woodhouse-lane, Leeds. A new heating apparatus has been put in by Messrs. Henry Holmes and Co., of Boar-lane, and an electric lighting installation by Mr. T. Harding Churton, South-parade. Structural alterations and general repairs have been carried out by Mr. W. H. Dews, and Messrs. Craven and Umpleby. The total cost of the alterations is £550.

Simon Ingersoll, the inventor of the Ingersoll rock drill, died at his home in Glenbrook, Conn., on July 24, at the age of 76. He had lived in retirement for some years, and was a plain and unassuming man. He died poor, although others made fortunes, by their efforts and business skill, out of his inventions.

The foundation-stone of a Conservative Club was laid at Pontypool on Wednesday week. The building is being erected in the Osborne-road, for a company, at a cost of £2,000.

The foundation-stones of a new Wesleyan chapel, to be erected in Argyle-street, Hull, were laid on Friday. The building will accommodate about 900 persons, and is estimated to cost £3,300. It will be in the Renaissance style, and is to be built of Lincolnshire red bricks, with dressings of Howley Park and Ancaster stone. Mr. W. A. Gelder, of Hull, is the architect, and Mr. David Robinson, of Freehold-street, Hull, is the contractor.

Legal.

ABOUT THE BUILDING LINE.

THAT the zeal of local boards in the country is apt to outrun their discretion, statutory and otherwise, and even to drop into caprice, is pretty well known to those with whom they come in contact. And the worst of it is, that when a local board does refuse to ratify plans of proposed buildings, although they may be entirely wrong, the litigation required to set them right is both costly and complicated. A recent case affecting the North Omesby Local Board (August 9) is typical of what too often occurs under similar circumstances. The owner of land on one side of a road, which the Board had taken over and dealt with as a public street, built himself a house in November, 1893, and set it back as far as 26ft. from the road, doubtless desiring to have a good garden in front of his own dwelling. He lately desired to put up some cottages upon his own land, upon the same side of the way, 90ft. from his residence, and for that purpose he submitted his plans to the board. But as these showed that the new buildings were to be erected only 10ft. from the roadway, they rejected his plans, on the ground that his own house, 90ft. away, with an intervening space of land between, fixed the building line, and so these cottages must be put back as far as was his house from the roadway. He now applied to a Divisional Court for a *mandamus* to compel the board to approve his plans, and he did so successfully.

Mr. Justice Mathew laid it down that the old statute must be construed reasonably, and each case decided upon its own facts. When it is proposed practically to take away a man's land from him, the Court must look closely into all the circumstances. If this land had been laid out for building purposes it would be different; but where there was no continuous building line of any kind, the statute could hardly apply. The Court finally held that the local board had no reasonable grounds for their objection—that although they might exercise a discretion, they had no right to enforce a caprice, and that, in short, there was no evidence of the existence at the side of the original building of any line of frontage which could be binding upon the owner of the land. It is quite right that the building line should be preserved as much as possible in all towns and cities; but when it comes to applying it in this rigorous way in what is practically a country lane, and to fixing an arbitrary frontage which the building owner never intended, it is satisfactory to find the Court interfering so decisively. **Fred. Wetherfield**, Solicitor.

1, Gresham Buildings, Guildhall, E.C.

Note.—All questions for reply in this column must be headed "Building News," and must reach my offices, as above, by *Tuesday* morning to insure answer same week.

A. J. B.—Building Line.—1. I think that, under the circumstances, and as the consent of the local authorities has not been obtained, B. is right, and on his complaint the authorities would have to take the proceedings mentioned in Sec. 3 of the Act. There is, however, a question to be argued, and A. should object to set back his buildings unless compelled by a decision to that effect. 2. I don't see that by-laws can override the rights of private property, and the contention of X. seems to be reasonable, and to observe the by-laws strictly he cannot build right up to the edge of his plot.

◆

Mr. Harry Hems, of Exeter, has received a communication from Mr. W. Fitzwilliam Terry, the secretary of the British Commission, intimating that the International Jury have awarded him and his son the gold medal for their exhibit of ecclesiastical sculpture and carved work at the International Exhibition at Antwerp. It is the same exhibit precisely that beat all comers, and took the highest award at the World's Fair, Chicago, last year.

Mr. W. J. Bird Clerke, M.Inst.C.E., an inspector of the Local Government Board, held an inquiry at the offices of the Barry and Cadoxton local board, on Tuesday week, into the application of that body for consent to borrow £1,733 for purposes of street improvement, and £1,967 for works of sewerage. Mr. C. R. Walker, M.Inst.C.E., and Mr. J. C. Pardoe (surveyor) attended, and explained in detail the plans of the proposed works. No objection was offered. The first loan is for the purpose of widening Barry-road, Cadoxton, and Croghan-hill, leading to the Merthyrdovan cemetery, and the second for works of sewerage in different parts of the district to complete the general scheme.

LEGAL INTELLIGENCE.

In re C. E. Newby, of Cardiff.—A meeting of the creditors of C. E. Newby, builder, Cardiff (summoned by himself), was held on Wednesday week. It was stated that there were liabilities of £2,617 to unsecured creditors, with £7,280 to creditors who held securities valued at £9,322; also £1,965 to a bank, and other smaller amounts. The assets showed a total of £2,229, which left a deficiency of £408. Ultimately, it was resolved that, if satisfactory terms could be arranged, a deed of assignment should be executed; failing this, that a receiving order should be applied for.

Chancel Screens.—The Chancellor of the Diocese of London, Dr. Tristram, delivered judgment on Wednesday in the case of the adjourned petition for a faculty to enable certain alterations and improvements to be made in St. Peter's Church, Eaton-square. It was proposed to remove the existing pulpit, and to erect a wrought-iron screen with a pulpit of the same material attached, and to so alter and add to the south transept and south-east chapel as to enable the latter to be used as a side-chapel with an altar. The estimated cost of the proposed alterations, for which Sir A. W. Blomfield and Son are the architects, was £2,100, the whole of which had been promised. Objection had, however, been taken by parishioners to the erection of the proposed screen; and with respect to this, the Chancellor delivered judgment on Wednesday, acceding to the application, he having last week granted a faculty for carrying out the other alterations proposed.

◆

CHIPS.

Last week Mr. James Bolton, C.E , who has just retired from the post of borough surveyor of Oswestry, which he has held for six years, in order to commence private practice, received a presentation of a case of silver fish knives and forks from the corporation workmen.

The Madeley and Brosely sanitary committee have resolved to proceed with the Sutton water scheme for Ironbridge immediately. For supplying pipes they have accepted the tender of Messrs. Cochrane and Co., Dudley.

The authorities at South Kensington Museum have been informed by the solicitors of the late Mr. John Hill that he has bequeathed to the Museum, under special conditions, his collection of pictures, bronzes, china, ivories, enamels, jade, and lacquers.

Mr. Mark Burbridge Smith, railway contractor, of Helsby, expired suddenly on the platform of Chester Station on Friday night. The deceased, who was 57 years of age, had travelled from London, and was walking across the Chester station, when he fell down and expired, death being due to heart disease.

The statue of Shelley, executed by Professor Lucchesi, will be unveiled at Via Reggio early in September. It was on the shore at Via Reggio that the poet's body was found on July 8, 1822.

A new church, dedicated to the Holy Trinity, is about to be built at Torquay. Mr. John Watson, of Lower-terrace, in that town, is the architect.

The new convent of Our Lady of Mercy, which has been built at Dundee, was formally opened on Saturday. The foundation stone was laid by the Right Rev. Bishop Smith in October, 1892, since which time the work of building has been vigorously pushed forward. The convent contains a community room, which will be used as a chapel for the inmates, a refectory, and a large number of cells.

The nave and tower of the parish church of St. Michael, Beguldy, Radnorshire, are about to be rebuilt from plans by Mr. W. R. Bryden, of George-street, Buxton.

A stained-glass west window was on Thursday in last week dedicated in Bednall Church by the Ven. the Archdeacon of Stafford. The window is filled with a "Te Deum" subject, and represents our Lord in majesty. Around Him in the various lights are grouped members of the "Glorious company of the Apostles, the goodly fellowship of the Prophets, the noble army of Martyrs, and the Holy Church throughout all the world." In the tracery are the "Agnus Dei" and two angels. The artists are Messrs. Heaton, Butler, and Bayne.

The contractor for the new fish dock at Hull, Mr. Kennett, of London, will commence operations in a few weeks' time. A considerable number of men are already employed in draining the site, and the project must be completed in eighteen months. The new dock will be about 1,000ft. in length, 300ft. in breadth, and 30ft. in depth. It will cover something like ten acres. The existing dock gates leading from St. Andrew's Dock to the graving dock are to be removed, and in their place a swing-bridge will be erected.

The foundation-stone of the Wood Green Cottage Hospital will be laid in Bound's Green-lane to-morrow (Saturday), by Mr. J. Passmore Edwards, the donor of the building.

WATER SUPPLY AND SANITARY MATTERS.

Conway.—The scheme for the supply of water from Cowlyd Lake, above Llanrwst, to Conway and Colwyn Bay, has been so far matured that the Mayor of Conway was enabled, on Monday, to turn on the Supply to Conway. This crosses the Conway river for Colwyn by a bridge, the only one of its kind in the Principality, almost on a level with the tubular bridge which carries the line of railway across the river. The approximate cost of the scheme is £50,000, Mr. T. B. Farrington, C.E., borough surveyor of Conway, being the engineer, and Mr. T. Bugbird, Carnarvon, the contractor.

Failsworth.—The first sod in connection with the construction of the sewage-disposal works for the township of Failsworth was cut on Friday. The site is in Green-lane, Clayton Bridge, at the extreme edge and lowest level of the township. The engineer, Mr. Charles J. Lomax (Messrs. Lomax and Lomax, Manchester) gave an outline of the scheme which is now being carried out. At the present time the district is only indifferently sewered, and practically new sewers for the whole of the district, comprising an area of 1,073 acres, have to be made. The main concentrating sewers are now being constructed by Messrs. W. and A. Peters, of Rochdale, and when these, together with the tributary drains, are completed the sewage will be completely diverted from the various watercourses, including the river Medlock and Moston Brook, and further contamination effectually prevented. The board have decided to adopt the "International" process at the outfall works, under which the solids will be precipitated in tanks and the liquid filtered through polarite beds before being turned on the land and subsequently finding its way into the Medlock, on the banks of which stream the works are situated. The purification works will consist of two detritus tanks and three precipitating tanks, each capable of holding 225,000 gallons. The sewage will enter the works at a level of 12ft. above the tanks, and the head will be utilised for the working of a water-wheel, which will do all the mixing of chemicals, in addition to elevating the sludge. The clarified sewage will pass from the tanks on to six polarite filters, so constructed that the filtered water from any one of them can be made to cleanse the surface of the others. The area of these filter-beds is extensive, it being the intention to deal with a large volume of storm water. For the outfall works the contract has been let at £8,700 to Messrs. George Freeman and Sons, of Hollinwood. The cost of the whole scheme is estimated at £28,000.

Worthing.—Major-General C. Phipps Carey held an inquiry at Worthing, on Friday, into an application made to the Local Government Board by the town council, for permission to borrow nearly £63,000 for certain works connected with the water supply of the borough. Mr. Corrie Grant, barrister (instructed by the corporation solicitor), conducted the case for the town council, and among the witnesses examined in support of the application were Mr. Jas. Mansergh, M.I.C.E., consulting engineer to the corporation, and Mr. Joseph Quick, consulting engineer to the West Worthing Waterworks Company. Of the sum stated, £35,300 will be expended on the new waterworks now being constructed at the foot of the South Downs, in the parish of Broadwater, the site being 78ft. above Ordnance datum, and a spot declared by Mr. Mansergh to be absolutely free from all possible risk of contamination. The machinery will be capable of pumping a million and a half gallons a day, and a reservoir with a capacity of two million gallons will be constructed. Another portion of the loan asked for is to be devoted to the purchase of the West Worthing Waterworks, the value of which has yet to be determined by the umpire, Mr. Woods. Two grounds were urged in favour of the acquirement of the works—the first, that the water supply of the entire municipal district might be under the control of the governing authority; the second, that the works, which are in the centre of a populous and growing neighbourhood, might be closed, so that all possible chance of contamination would be avoided. There was no opposition to the proposals.

◆

A south porch, of 13th century design, has been added to the parish church of St. Peter, Greatworth, Northants. The builder was Mr. Watts, of Helmdon, and the architect Mr. J. Timms, of Banbury.

Alterations are being made to the Working Men's Club, Barrow-in-Furness, including the ventilation, which will now be carried out on the Boyle system, the latest patented improved form of self-acting air-pump ventilator being adopted for the extraction of the vitiated air.

The city council of Rochester have decided to expend an estimated sum of about £3,250 upon works of storm-water drainage at Strood, the low-lying parts of which suburb are flooded whenever there is heavy rain.

Our Office Table.

Sir James Linton and Mr. Orrock have returned to the attack in the *Times* on the director and trustees of the National Gallery, whom they charge with allowing the asphaltum-painted works of the British school in that collection to deteriorate, because the atmosphere surrounding them is not kept sufficiently humid. They point out that in the Diploma Gallery of the Royal Academy, not half a mile from Trafalgar-square, there have been hanging for many years a number of pictures exactly the same in origin and date as those which are said to be now decaying in the National Gallery—pictures by Wilkie, Stanfield, Constable, and other English artists of that period—which are asserted to be essentially in good preservation. The difference is said to be due to the fact that water-troughs are provided at Burlington House and not at Trafalgar-square; but it is doubtless to some extent owing to the crowded condition of the one gallery, with the consequent impregnation of the air with carbonic acid, and the deserted state of the other suite of rooms. Possibly, as Mr. E. R. Robson, F.S.A., contends, improved ventilation might diminish the evil; but, as Sir J. C. Robinson points out, while the employment of gas and of heating apparatus increases the rapidity of cracking, the deterioration is inevitable in the case of works in which bituminous pigments were used; indeed, some of Wilkie's pictures under Sir John Robinson's care in Buckingham Palace, which have certainly never been exposed to great fluctuations of temperature, exhibit similar seams and cracks.

An anonymous donor has presented to the National Gallery a work by the late William Dyce, R.A. (1806-64), representing "St. John Leading Home the Virgin Mary from the Sepulchre," exhibited at the Royal Academy in 1860. It was hung on Monday on the west wall of Room XIX., measures 42in. in width by 29in. high, and is numbered 1426. The scene is the hillside without Jerusalem, the masonry entrance to the new tomb hewn in the rock being on the right. Prominent in the foreground is the Virgin Mary, who has thrown a mantle over her red robe, beneath which her sandalled feet are visible. In her left hand she carries the crown of thorns, while her right hand is laid in the palm of the Beloved Disciple, who is shown with the traditional youthful face and long hair, and clad in dull green and grey robes, but bareheaded and barefooted. Seated on the ground beside the tomb are the two other Mary's, and two bearded men, probably intended for Joseph of Arimathæa and Nicodemus, are leaving the garden inclosure. To the left are one or two of the towers and buildings of the Holy City, and overhead black cumuli are sweeping up over the dark-blue sky. The colouring is harmonious, and the grouping, dress, and scenery of the character deemed a generation since appropriate to Palestine. It is the second work in the collection by Dyce, the other being his "Pegwell Bay, October, 1858" (also a painting from the Academy Exhibition of 1860), purchased in March last at the James Brand sale, and now hung on a screen in the adjoining room XVIII., and numbered 1407. The work by Adam Elsheimer, mentioned by us last week as one of four new pictures, has been numbered 1424, and is hung on the south-west pier of the Dome. It is a bequest from the late Mr. Samuel Sandars.

The curatorship of the Soane Museum, which has become vacant by the death of Mr. Wyatt Papworth, referred to elsewhere, is worth £300 a year, clear of all deductions, with residence. The conditions of the appointment are peculiar. Under the private Act governing the management of the museum, the appointment is vested in the President and Council of the Royal Academy, who must proceed to an election within three months of the occurrence of a vacancy, the requirements being that the curator shall be an architect of English birth, and not less than 25 years of age, who shall have distinguished himself in architecture or have carried off some academical prize. Since the museum was opened, on the death of Sir John Soane, January 20, 1837, a period of 57½ years, there have been but four curators—George Bayley, Soane's pupil and assistant, 1837-60; Joseph Bonomi, the Egyptologist, 1860-78; Joseph W. Wild, the Orientalist and decorative artist, 1878-1892; and Wyatt Papworth, the bibliographist of architecture, who died at the Museum on Sunday.

Under the title of "A Rare Opportunity for London," Mr. W. Howard Seth-Smith, past president of the Society of Architects, pleads with the Duke of Bedford in yesterday's *Times* that he should take full advantage of the possibilities of beautifying and dignifying the Metropolis, which will arise in the approaching rebuilding of his estates. As Mr. Seth-Smith points out, half one side ot Russell-square is now advertised for lease, and such a magnificent site is probably already the subject of some speculative scheme in the hands of parties who, alas! too often, either from ignorance or greed, study their utilitarian interests without consideration for the feelings of their fellow-citizens. Such a disaster has, he added, just befallen the neighbourhood of Lincoln's Inn-fields, and it is to be hoped that a repetition will not be permitted in Bloomsbury. He therefore appeals to the Duke of Bedford to act in a public-spirited manner, for it is only the great freeholders who have it in their power to create appreciable oases of beauty in this great desert of ugliness.

According to the annual report of the medical officer of health of the London County Council, the population of the County of London shows a decline in the rate of increase, partly due to a decrease in the number of immigrants. Since the decade between 1841 and 1851 there appears to have been a fall in the rate of increase per cent. In that period the increase was 21·2 per cent., since which it has been going down, till between 1881 and 1891 it was only 10·3 per cent. The population at the last-named year was four millions and a quarter, representing an addition of 396,199 persons during the decade, or a number which is said to be exceeded only by four large towns—Birmingham, Liverpool, Manchester, and Glasgow. The manner this number is distributed points to considerable fluctuation. In some parts of London—the central portions—there has been a decrease; but in other districts—in the north and south—there has been an increase, due in a measure to immigration, showing a decided efflux of the population outwards.

Down to the end of 1892 the London School Board has spent on the building of schools a sum of close upon three millions sterling, and the expenditure of 1893 brings the total cost of all the schools erected out of the rates in London to upwards ot that sum. Last year alone 14 new schools were opened, and 25 old schools were enlarged, and the accommodation thus provided afforded place-room for 22,000 boys and girls. The development of the technical schools is a marked feature of the board's arrangements for the year. Thirteen new cookery centres have been opened, besides 18 new laundry centres and 15 centres for manual training, while two centres for the blind and three for the deaf have also been established.

The members of the Sanitary Inspectors' Association held their annual summer meeting on Friday at Ramsgate. The visitors were received by the Mayor (Alderman Blackburn). At the business meeting Mr. Thomas, of Bermondsey, presided, in the absence of the President, Sir B. W. Richardson, who is in Paris. Dr. Styan, Medical Officer for Ramsgate, and Mr. W. A. Valon, borough engineer, read papers dealing with local matters. Mr. E. Tidman, M.S.A., member of the council, contributed a paper on the future work of the Association. He advocated the establishment of headquarters, of a series of lectures, and of a journal devoted to the interests of the Association. Mr. Thomas, in his address, dwelt upon the importance of sanitary officers' duties, and suggested that the tenure of office should not be for a year, but for an indefinite time, provided that the inspectors were competent and men of the highest integrity. After these proceedings the guests, who included members from all parts of England and Wales, were entertained at luncheon by the Mayor and Corporation, and later in the day took a trip to sea round the lightships and the Goodwin Sands.

Some interesting experiments are at present being made in the relaying of Buchanan-street, Glasgow. For many years wood has been the pavement used for this thoroughfare, and in order to test the particular timber best suited for the traffic, four different kinds of wood are now being used in the relaying of the street. These are Jarrah, Karri wood, Kauri pine, and carbolished pitch-pine. In addition to these, a new cork pavement is also to be experimented with. Some time ago brick paving was tried, but this has been given up as a failure.

According to *Indian Engineering*, Bombay Harbour is "incredibly abominable." Although large sums have been expended on sewers, the harbour is described as being most insanitary. The authorities themselves are blamed for allowing offensive drains to discharge into the harbour and basins above low-water mark, beyond which the natives are permitted to bathe in the harbour. An intercepting sewer, to protect the eastern shore of the island, is recommended, as proposed by Mr. Baldwin Latham.

Trade News.

WAGES MOVEMENTS.

Bolton.—The federated employers resolved on Friday to lock out the operatives in the building trade if the stonemasons' strike against sawn stone is not settled within a fortnight.

Glasgow.—A strike of Glasgow lathsplitters has taken place for an advance of 1d. per hour—½d. to come in force from Monday last, and the other ½d. in November, with proportional advance in piecework. The employers offered ½d. advance on 1st October.

CHIPS.

Henry Barker, a building material dealer, was at Stratford Police-court, on Saturday, charged, on remand, with removing and concealing large quantities of goods within four months of his bankruptcy, with intent to defraud his creditors. Further evidence was given in support of the charge, and the prisoner was again remanded.

At Liverpool County Court, on Wednesday week, in an action under the Employers' Liability Act against Mr. James Bell, a contractor, his Honour Judge Shand awarded £130, together with costs, as compensation for injuries received at the Brunswick Goods Station by a labourer named John Brown.

Mr. W. J. Bird Clerke, M.I.C.E., one of the inspectors of the Local Government Board, held a public inquiry at the Town Hall, Cowbridge, on Wednesday week into the following applications by the town council:—(1) Approval of loan of £800 for improving the town hall; (2) also of loan of £600 for works of paving in the borough; (3) approval of the sale of land for the site of a proposed young men's institute. The plans and details of the town hall improvements were explained by Mr. C. B. Fowler (Messrs. Kempson and Fowler), architect, Cardiff; and those of the paving scheme by Mr. John Daye, engineer and surveyor, Roath, Cardiff.

On Saturday last the members of the York Architectural Society visited Newburgh Priory, Coxwold Church, Shandy Hall, and Bylands Abbey.

Messrs. P. Munro and Son, architects, of 2, St. Stephen's Chambers, Baldwin-street, Bristol, write:—"Referring to your notice of the grand pump room and spa, recently opened at Clifton, in your issue of the 10th instant, we beg to say that we were the architects, and Mr. G. C. Marks the engineer. Kindly correct this error in your next issue, and oblige."

At the last meeting of the Hampshire County County Council the lunatic asylums committee reported that tenders for the erection of sanitary spurs had been received, but they regretted that the lowest tender exceeded the sum which was estimated after consulting the county surveyor. The lowest tender was £8,080, and this, with the clerk of works' salary, would need an extra £1,600, but the additions would not only provide the sanitary accommodation, but set free space for 48 additional beds. The extra 1,600 was voted without demur.

SUGGESTIONS FOR THE SKETCHING SEASON.

AN American novelist has expressed a strong opinion that "all the stories have been told." We sometimes hear it stated, in like manner, that all the buildings have been sketched. And when we see how, almost every year, the same, or nearly the same, views are repeated by one architectural student after another, we can easily understand why the belief arises. The fact is, there is a run upon certain subjects. Sometimes it is because they are within easy reach. Sometimes, again, it is because they are in an attractive neighbourhood, and in other cases because there is good accommodation in their vicinity for man and beast. This last is by no means an unimportant circumstance. A careful drawing takes time, and if it involves repeated journeys from a distance, it becomes both troublesome and expensive. It may happen that such journeys are taken needlessly. Both comfort and cleanliness may be found in very modest hostelries, and it is not everyone who prefers to stay in a railway hotel with the latest improvements, when, for half the money, he can take up his quarters in some village inn, "where the sheets smell of lavender."

After all that has been done to illustrate English architecture, there are many imperfectly-studied subjects, as well as many almost untouched localities. There is, for instance, the subject of ancient glazing, both ecclesiastical and secular. Where it consists of figures, a certain proportion of it has been drawn; but ancient glazing of a less ambitious type is even more suggestive for ordinary purposes—and yet how little it is generally understood. No doubt it is hard to meet with, and what remains of it is commonly in odds and ends, patched up with modern additions. It has to be picked up here, there, and everywhere, as one comes upon it; and, as a rule, not much can be met with in a single holiday. But sketches accumulate, and after some years spent in different parts of the kingdom, enough might be brought together to make a very interesting book.

Coloured decoration is another field which has not been systematically explored. There is a larger, if not a richer, harvest to be reaped here. Many of the examples, too, lie closer together. The Eastern Counties may be successfully searched for work of this class, both on walls, roofs, and ceilings. There are remains of it in Gloucestershire, as at Fairford and Oddington, and a good deal is left on Devonshire chancel screens. Even in well-whitewashed churches a fragment may be found here and there behind pulpits and pews of the past Reformation period; and bits of coloured woodwork may be brought out from lumber-places in the tower, or in less dignified positions. No doubt the golden age for discoveries is over. The first church restorers were only too fortunate, had they but known it. A few of them, like Mr. Street, preserved all that was worth keeping, and preserved it so as to make it public property. But with others the custom was to "clean and modernise," and the cleaning included the removal not only of dirt and of whitewash, but also of the distemper ornament which the whitewash had overlaid.

Not much has been done in collecting details of artistic plumbing. The world has almost forgotten that such a thing is possible. The incompetent plumber it knows, and the careless plumber, and it is coming to know the registered plumber; but to speak of an artistic plumber seems to it a mere contradiction in terms. Yet artistic plumbers flourished, both here and on the Continent, for centuries. If their productions are scarce, it is not so much because there were originally few of them, as because they have more enemies than the handiworks of the mason and the carpenter. We shall never know how many of them were melted down in the time of war, or stolen in time of peace. Of those which remain, a few are Mediæval, but most are Elizabethan or Jacobean. There are many in out-of-the-way villages in Huntingdonshire—such, for instance, as Layton, where Herbert the poet was rector before his removal to Bemerton. Some of these, which are chiefly the rainwater pipes of the church, are very original and interesting. They show how even an unpromising material like lead can be made beautiful, not by disguising it with forms derived from other substances, but by bringing out, on the contrary, its own special characteristics and capabilities. One example here is dated 1632, and another 1634. There are, or were some years ago, other specimens of the same or a rather earlier period at Easton, Hunts, and at Woodford and at Lower Aldwinckle, Northamptonshire. We published in 1878 some interesting sketches by Mr. Lethaby of the fine series of lead water-shoots which remain at Haddon Hall and at Duffield. These are similar in general form to the Layton ones, but perhaps a little older, as well as considerably more elaborate.

Encaustic tiles, probably, are going out of fashion. If so, it is because the making of them in our times has not been an art, but rather that terrible thing which is the opposite of all art, and which goes by the name of "art-manufacture." Art-manufacture consists in taking a design—perhaps good in itself, perhaps far from good—and then stereotyping it and mechanically repeating it all over the country, till everybody is sick of it. So it was that, in the earlier days of the Gothic revival, a certain number of old 13th and 14th-century tiles were copied and manufactured wholesale. The designs were "correct," and the quality was excellent. From then till now we see these same designs in pattern-books, we see them in churches, we see them in halls, we see them in railway stations, till we pray that they may speedily wear out, and that nobody may see them any more for ever. But we do not weary of ancient encaustic tiles in this way. The people who made them knew when to stop. They understood that it is possible to have too much even of a good thing. They were wise enough to refuse the fatal facilities for repetition which the pattern-maker offers to the otiose architect and the money-seeking manufacturer. They were always getting rid of stock forms, and always inventing new ones: new ones, moreover, that were made each for its special position, and that so have the charm of individuality about them. The student whose holiday is spent anywhere in the neighbourhood of the Severn will still find much to do that is both easy and useful in preserving memoranda of unpublished tiles. Many of the patterns in modern use were copied from specimens at Malvern, but many others remain there, or did remain, before the Priory Church suffered its last restoration, which are very little known. Tiles were made in the parish from the 12th century, as it would seem, down to the 18th. It would be interesting to know whether they were exported to any distance by ship, and whether it was from Worcestershire, for instance, that the few which remain in a church at Pembroke were originally brought. But, however this may have been, we do not find many of the Great Malvern patterns in old work elsewhere. Even in Little Malvern the types are different, and they are still more so at Chasleton, an interesting little Gloucestershire church some thirty miles away.

So much for unexhausted subjects. Little-visited localities exist here and there all over the kingdom. Very often they lie near a well-worn track. The Great Western, from Newton to Plymouth, is tolerably familiar; but few of those who traverse it know that to the south of it lies a country almost as remarkable for architecture as for coast scenery. It is full of churches of the Cornish type, for the South Hams, as this district is called, were practically a part of Cornwall down to the later Middle Ages, and Cornish was actually spoken there. These churches are generally without clerestories. They have high western towers, severely plain and yet impressive—their principal feature being the staircase turret, carried up for a beacon, in the centre of one side. Within there are wagon-roofs—at least to the chancels—and very often elaborate oak chancel screens. The style in general is rather Late Perpendicular. At Aveton Gifford, however, near Kingsbridge, there is a much earlier cruciform church with a central tower, worth measuring up and publishing. The exterior has always been plain, but the windows inside have been shafted and richly moulded. Totnes is better known. It is a curious old town, with houses covered with vertical slating to keep out the rain, and this slating twisted and tortured into the semblance of columns, pilasters, entablatures, and everything else that slating naturally refuses to represent. To see how slate-hanging ought to be used, we must go further—say to Penzance—and there, in a few old houses, we may see how Cornish workmen, a couple of hundred years ago, had learnt artistic secrets which still seem hidden from the wise and prudent architects of Central England.

North-west Devon and North-east Cornwall are more often visited. Ilfracombe is almost as familiar as Brighton; and yet, at Pilton, a few miles away from it, and close to Barnstaple, there is a church containing most interesting wood-carvings, between Late Gothic and Early Renaissance, which do not seem to have met with the attention they deserve. They strike one as rather Flemish than English, and so, indeed, does a good deal of the other woodwork in this district. This is the land of carved bench-ends—not traceried ones, like those which abound in the Eastern Counties, but bench-ends really carved, each with a different design. Some have sacred emblems, some have heads, others have coats of arms, and others, again—whose owners, unlike Master Shallow, could not "write themselves *armiger* in any deed or quittance"—have only initials and dates. They are all interesting; they are doubly interesting to students with a taste for heraldry, and especially with some knowledge of local history. There are many at Morthoe, many more at Braunton, and some, probably, in most of the churches where worshipped the captains and sailors of Kingsley's "Westward Ho!"

THEATRE DESIGN.

A GOOD deal goes by rule in the design of our public buildings. The traditional form lingers long, and any departure is regarded as an experiment of doubtful value. In this country we have this conservative instinct very strong in the building of our houses, churches, and public edifices. Any form which has not grown with our habits, or the uses of society, we naturally regard with suspicion and mistrust. In America, we see many strange developments taking place in the erection of domestic buildings, as well as in those which minister to amusement. If we take, for example, the theatre, it has been reserved for our Transatlantic cousins to make several modifications we do not think in every respect improvements upon our own, but which have their suggestiveness. In a recent contribution to the *Engineering Magazine*, Mr. Dankmar Adler writes about "Theatre-building for American Cities," and what he says may have some interest to those who build theatres here. As he remarks very truly, while a theatre counts its patrons by the thousand, only a few have any personal or financial interest in its erection, or become acquainted with the details of its construction, equipment, or operation. Therefore it is that public opinion—that is, theatregoers—have very little to do with theatre construction and management, and they continue to be erected as the embodiment of the few who have a financial interest in their erection. The public will go to any house which has a sufficient attraction, no matter how badly equipped or planned it is for means of entrance or egress, how badly ventilated, or how indifferently administered. As Mr. Adler remarks: "No matter if the house be a notorious fire-trap, or how steep and incommodious the stairs leading to different parts of the auditorium," no matter how vile the atmosphere, or how bad the acoustic qualities, a popular attraction is sure to draw a crowded house. Fortunately, the proprietors and managers are beginning to awake to the advantages of a liberal outlay. In this country the by-laws that have been framed, which insist on a certain degree of isolation of the building and its approaches, and a proper number of entrances and exits, and the fireproof construction of the staircases and other parts, have initiated many of the improvements which our American cousins are carrying out. It is quite certain that if the playgoer has his choice he will go to a comfortable, safe, convenient, and well-ventilated theatre, rather than to one of the old-fashioned, unsafe, and insanitary kind.

Mr. Adler is justified in his remark that it is undesirable to have too large an auditorium, and that a house containing from 1,200 to 1,500 seats will be more satisfactory than a larger one. Except for grand opera and great spectacular performances, seating capacity should not much exceed these numbers. He says truly:—"A certain intimacy of relationship between the actor and spectator is essential in all the lighter forms of stage production, and the ability not merely to hear what is said or sung, but also to follow closely the facial expressions and gestures of the actors, is a necessary condition to the enjoyment of plays of every kind, except only the purely spectacular or the purely musical, or combinations of the two." Many people, as he says, "hear partly with their eyes," and it is, therefore, necessary that the stage should be near the bulk of the audience—a condition rendered impossible if the auditorium has more than 1,800 seats, which limit is considered the danger line. In a series of articles that have been appearing in our pages the importance of so arranging the seats that their occupants can see the stage has been brought before the reader, for, as Mr. Adler says, if the entire action can be seen, the hearing is much less difficult. Mr. Scott Russell's "isacoustic curve" principle is adopted in the majority of good theatres—that is, by making the stage floor at the curtain-line the centre to which the lines which determine the curve are drawn. To make the total rise of seats come within the available limits of space, certain modifications may be necessary—as drawing the sight-lines over every second head, or setting the seats alternately behind each other. Of course, the sides as well as the centre of the stage ought to be visible, which renders it necessary to draw the curve of the seats in such a manner that those seated at the sides may have good sight-lines or diagonals. The plans of M'Vicker's Theatre, Chicago, illustrate a good example of a bank of curved seats arranged to allow an easy view of the corners of the stage. Upon acoustic principles, as they are exemplified by the theory of the transmission of sound-waves on the principle of the trumpet propagation, the proper curve on plan is fan-shaped, which cuts off a number of front side-seats, from which a poor view is obtained; and as our readers know the vertical section of the auditorium must be so designed as to imitate somewhat the trumpet shape, to conserve the sound-waves; to this end the proscenium must be low—only just high enough to allow a view of the back of the stage from the highest seats, and the ceiling of the auditorium will consequently increase in height from the proscenium outwards. The Auditorium, Chicago, gives a longitudinal section of this shape, arranged in a series of arched soffits, one larger than the other, the lowest being close to the proscenium. The value of breaking up the ceiling and wall surfaces is obvious in checking reverberation, and the architect does well to introduce pilasters, arches, beams, and other obstructive means for breaking up the sound-waves and deflecting them into the auditorium. These advantages, as it is shown, are better secured in a moderately wide and short house than in a narrow long one. The stage, too. may be larger than required for an effective stage setting. The great size of some of the Continental stages, like that of the Grand Opera House, Paris, is seldom called into requisition. M. Adler says: "The theatres that are likely to be built in the future will be devoted to a light class of performance, which can be given with a small number of people, and with stage fittings less ambitious as to size than those of the great theatres of New York, Chicago, Boston, and other cities." It is easier to produce splendour of effect on small than very large stages, and such theatres are most suitable for travelling companies. Alluding to the width of proscenium opening, 30ft. is considered ample for all houses less than 70ft. in width between the walls. Openings of from 45ft. to 50ft. are adapted for the most elaborate spectacles, and these dimensions are found only in the Auditorium, and Metropolitan and other large theatres of the States. For depth, from 25ft. to 50ft. is not considered too much, even for light comedies, and for height, 60ft. to 80ft. is not excessive. These facts and figures are worth bearing in mind by promoters and architects of new houses, when space is so valuable in our large towns, and the regulations in force are so exacting. Mr. Adler's paper deals also with the necessity of ample light for the stage, which cannot be too brilliant; for workshops for the manufacture and repair of properties; for the accommodation of the orchestra and their instruments; and for dressing-rooms—which provisions are often very inadequately met.

OLD AND NEW PROBLEMS.

A GREAT deal of the work of the ordinary architect consists in "following instructions," or in carrying out the whims of clients—a condition from which the painter, the sculptor, and the composer in other arts are exempt. Indeed, the working out of a given problem is that which separates architecture from the sister arts. Both the painter and sculptor know nothing of this restraint—they have simply to imitate or reproduce Nature in colour or marble, or to allow their imagination free play. The history of architecture shows clearly that the problem has increased in perplexity. The early Greek architect had simply to enshrine a deity, to form a fitting receptacle for his god or goddess, and the simple cella surrounded by the majestic peristyle was the result. No more beautiful or fitting form could have been conceived. This idealised structure has never been excelled for such a purpose. It was to enshrine art of the highest kind that the temple form had its beginning, and even the peristyle itself is assumed to have had its origin in protecting the paintings on the walls of the cella—so, at least, some have thought, for Fergusson has doubted whether an arrangement so apparently devoid of purpose would have otherwise been invented; but this is only an opinion, which hardly seems to be worth much. If not used as an ambulatory, the open peristyle was, we rather think, a sensible arrangement for screening the cell from the rays of the sun, and for emphasising the dignity of the structure. The tombs and palaces of Egypt and Assyria, equally with the temple, were embodiments of simple requirements. The Mediæval architecture of Europe exhibits a more complex problem. The requirements of the religious houses of different orders and an elaborate ritual necessitated the design of buildings of more intricate character, embodying more complex arrangements. Modern, social, and industrial progress have paved the way for still more complicated building problems, and we have to-day a variety of institutions—educational, religious, industrial, and social—which no previous age knew anything about. The building problems are not only numerous, but more complex. The modern house is a far more intricate building than any previous Domestic type. Science has placed at our disposal modes of draining, ventilating, heating, and lighting, which have to be embodied in the architect's design. Then our schools, libraries, museums, municipal buildings, baths and washhouses, hospitals, asylums, institutes, factories, &c., are problems that have only been called into requisition during quite recent times. Our forefathers knew nothing of them. All these things have vastly added to the intricacy of architectural problems, and have made it immeasurably harder for the designer to achieve the artistic triumphs of his predecessors, for, as Macaulay has said in his essay on Milton's poetry, our more complex civilisation has served to stifle genius, and to render it impossible to produce works of the kind which were common when mankind had simple wants and tastes, and imagination was childlike and untrammelled.

It is not exaggeration to say that the simplest ideas have favoured the best art; that when modern conditions and requirements imposed restraints on the architect, he fell away sadly from his first estate. The simplest ideas and aspirations of humanity found their expression in the temple and the tomb, and in these designs architecture came nearer to the sister arts of painting and sculpture. But we are now confronted with a variety of problems more or less complex. The architect has to take Mr. Brown and Mr. Smith into his confidence, to consult their wishes and follow their instructions; the client has to be pandered to, even in those things he understands so little about; and the contractor and building tradesman have to be consulted, for there is a conventional understanding under our present system that an architect cannot choose exactly for himself, but must follow the dictates of the trade, and must use or specify those materials and fittings which have been sanctioned and put into the market by the manufacturer and his agents. In these days it is seldom a question of designing a building just as one likes without let or hindrance. A matter of requirement, of plan, and cost all stand in the way, and the highest praise is due to the architect who can honestly carry out his instructions with an artistic sense and appropriateness. It is this question of a problem, then, that makes architecture so different to all other arts. Mr. Great-Show instructs his architect to design his corner business premises with as large a window-space on two fronts as possible, with an entresol mainly of glass above it. The architect fears to say, "No, it is bad architecture to give so much space to plate-glass, and to carry the superincumbent brick building on stilts of iron." The instruction must be obeyed, however much the grievance may be mitigated or disguised. The problem here is to render artistic that which is a flagrant violation of architectural propriety, and the architect has no alternative but to comply or refuse. Many designs have to be made under a most trying conflict of opinion and caprice. The corporation of the thriving town of Pushington desire to erect a town-hall and offices, and they advertise for designs after their own surveyor has tried in vain to embody their wishes at a ridiculously low figure. One member declares that a larger hall can be secured for the money; another magnate that it would be easier and cheaper to convert some old corporation premises than to build. The competing architects are hampered by absurd conditions, and have to fulfil the most irreconcilable instructions. The boldest and most defiant competitor wins, simply because he has ignored the cost altogether, and gone in for a perfect scheme. The ratepayers throw the whole overboard, and advertise another competition. This is no imaginary case of an ill-considered problem, in which the architect is put to trouble and expense to teach his employers what they want. How many competitions have ended disastrously for the profession simply because of wrong instructions of ill-conceived problems! How often the employer or committee learn their experience at the expense of the architect, who goes out of his way in preparing designs from instructions which he knows to be imperfect, but is afraid to point out their defects. The competing architect knows too well how many times he has been baulked by following too closely the instructions—in not using his own judgment. If he has left space enough to preserve an "ancient light" he is outdone by another competitor, who, less scrupulous, has made a larger hall to fulfil the accommodation required. The plan with carefully worked-out areas is set aside by the assessor for one of more skilful design. How far is the competitor justified in following one instruction if it militates against another and more important condition? Suppose the conditions require a certain number of rooms or offices to be provided on the ground floor—more, in fact, than can be got in; is the designer at liberty to reduce the dimensions of the rooms, or to place one of them on the first floor? These and many other points occur to all competitors in solving a problem.

The residential block, or hotel, is a modern problem of complexity of which we have no equal in former times. City life in this age has created a number of necessaries, and the man who has to design a block of modern residences of a superior class has to make himself acquainted with the habits and customs of civilised society. The requirements are numerous and perplexing. Promoters of such buildings may give certain instructions as to accommodation, but the architect is held responsible for any serious defect. As to the architectural success of these blocks of flats there is not much to boast of, when every floor is a repeat of the one below. Nevertheless, it is one of the many problems which makes the architect's work distinct from that of any of his artistic compeers. He has so to clothe buildings of the most exacting utility that they shall not be offensive to the eye. The technical school, the fever hospital, the modern baths, the workmen's flats, are all of this kind. If architecture is to become again an art worthy of its earlier traditions, the problem to be solved should be clear and explicit. Those who instruct the architect ought to know exactly what they want. But how few of those who employ architects do! Their ideas are vague. In matters of plan, dimensions, and cost their views are taken from particulars that have no reference to analogous buildings, but from arbitrary opinions. The question whether an architect ought to pay attention to instructions, or adopt his own views of what is right, is important, as it may result in all the difference between a good or inferior design. The point is one which deserves the attentive consideration of the profession. No doubt there are special occasions when the client must be consulted, as in matters pertaining to his particular requirements; but there are more occasions when the architect is necessarily the best judge. As the law holds him responsible for mistakes of judgment, he should certainly be able to decide on those questions of plan and construction which he is called upon to solve. In questions of art he, at least, ought to be the authority. He is not in the position of the student. In one of the reports issued by the examiner of the stage of elementary design at South Kensington, it is observed that "candidates have done what seemed good to them, and not at all what was given them to do." Very casual attention is paid to instructions, and the examiner insists that it is more than ever essential that obedience to conditions should be enforced on students. But these conditions apply to material, given space, whether the design is to be composed of straight lines or curved, and the principles of design applicable to students. No such leading conditions are necessary for architects. The instructions they receive from clients are more or less arbitrary and defective. Many of the particulars issued to competitors are drawn up by committees wholly unacquainted with the building or the requirements of good design, and there is much loss of time and much ambiguity caused by competitors writing for answers to questions that occur to them. All round, the profession is trammelled in this way. The fact is, public opinion has to be consulted, and the architect has to embody the views of interested parties, of managers and promoters, rather than of those who really use and have to inhabit the buildings.

OF CHURCH EMBROIDERY.—XIII.

By May Morris.

[CONCLUSION.]

IN glancing over these notes on old ecclesiastical embroidery, I notice that I have omitted to say a word about *colour*, beyond a few abusive references to the quality of modern colours of ritual. So, before referring to my present illustration, and therewith drawing to a conclusion, I should like to make just this general observation on the subject: Roughly speaking, you may say there are three methods of treating colour—firstly, the design is distinctly dark on a light ground; secondly, the design is lighter than the ground; thirdly, ground and design are near each other in tone, and form a patchwork—a piecing-in or, as it were, a *mosaic* of colour, though, of course, clearly defined and separated by contrast and by a distinctive outlining. Of these schemes, the second and third are to be principally considered, and I should say that the second—light design on a dark ground—is, on the whole, the most decorative. It is richer in colour than a dark design on a light ground, which may look hard and poor, and is more susceptible of beauty of form than the third or mosaic scheme of colour on colour. In the first scheme, colour is mostly subordinate to form; in the third, form (I say this with reservation) is subordinate to colour; in the second, form and colour both have their due place. I do not want to suggest a hard-and-fast and pedantic distinction in this; but if any of my readers care to confirm the observation, so far as concerns the difference in quality between dark on a light ground and light on a dark ground, they might compare the illustrations for this and the last two numbers. The sheet accompanying Number XI. of these notes has two designs—one dark on light, the other light on dark. It does not take much consideration to choose the best of these two. The fact is, the dark design on a light ground is apt to start out a little from the "picture-plane," hanging in mid-air, so to speak—a bad fault in flat ornament; whereas the stork design, and those in the sheet accompanying the present paper, as well as the beautiful scrap given with Number XII., are richer in tone and look distinctly flat. In embroidery, certainly, more than in woven stuffs, almost anything can be done in the way of laying colour upon colour; but sometimes a more simple scheme is required, and then it will be found, as a rule, that that arrangement is the most satisfactory in which the ground is several tones darker than the colours laid upon it.

Such embroidery, rich and elaborate, as lends itself to a mosaic-like colouring, requires skilful treatment, and is perhaps most successful in the hands of Oriental workers. Gold, I have said elsewhere, can be considered in two ways—either as mere *colour*, or else as *metal* itself. That is, if you want a golden lining to a mantle, or a golden nimbus round a saint's head, do not hesitate to put it in, even if the scheme of colour does not include a rhythmical or in any way continuous use of the metal. There will be no fear of spoiling the harmony of colour if the gold thus used is lowered in tone so as to reduce it to the same key as the other colours used: such toning down is done by employing fine silk of different colours for sewing down the gold, and sometimes by coloured silk laid underneath the gold thread. The raising or modelling of gold treated in this way should be of the slightest, and better avoided altogether. When treated as metal, on the other hand, it may be raised and moulded to any extent, and made as brilliant as may be, the effect heightened with pearls and other stones, with rare enamels, and so forth. Here the very materials must look precious, magnificent, and regal—a little showy, if you will, or, shall we call it, Byzantine. But, alack, Eastern showiness is not 19th-century showiness, and we have to be careful to avoid vulgarity, just because we are so self-conscious, and are supposed to know better than the Grecian workman. This is no fanciful distinction between the methods of handling gold. Make the same study and comparison of the best work that I have done, and you will confirm these notes on the difference between flat colour-gold and raised metal-gold mixed with goldsmith's work, and closely allied to it.

You will be rather surprised at my having chosen as illustrations to preach upon lately as many as five examples taken from woven fabrics, while our subject is embroidery merely. I detest as heartily as anyone that lazy amateur habit of applying a design intended to be reproduced in one method and special materials, to another method and different materials, and therefore hope no one will think me guilty of suggesting any of these illustrations as "suitable for any kind of needlework." But I have chosen them as excellent examples of living nature in mediæval art, and because they are beautiful specimens of the designer's skill, workmanlike and well balanced, the ground neatly covered, the forms vigorous, and instinct with observation and knowledge of nature under every aspect. The designs on the present sheet, moreover, are interesting technically on account of their construction. The pelican group does not at first sight look as though it were formed on the "net" construction; but if you were to repeat it over a large surface you would see the lines of the net at once, not in the design itself, but in the band of empty ground between the groups, which are placed alternately. The same with the bird group on the left side, the net here being flatter and not quite so obvious, owing to the tips of the wings nearly meeting on either side, and filling up the bare band. Both are taken from paintings, the pelican from an altar-piece at Ghent, and the other from a picture of the old Cologne school; but this latter, I should think, and most likely both, Italian in feeling, and copied from some Italian fabric. The pelican group is extremely handsome, and so simple that you feel that you could have done it yourself. If one were to take away those little groups of bell-flowers hanging at the bottom, they would look quite stiff in themselves, yet in their place they are flowery and right. I like forms that are right and beautiful in their proper place to look wrong and tiresome away from it. One feels a spiteful pleasure at seeing a fine, well-conceived piece of work that has been taken away from its surroundings and used for a different purpose, obstinately refusing to look beautiful any more. I have been asked to admire the design of a Persian plate utilised for drawn-thread lace; I have been shown the border of a Greek mosaic turned into decoration for a woman's gown. Such little ingenuities make no one happy but the misguided adapters themselves. One objects to having design made to do "general utility"; the historic table that opened into a step-ladder, or shut-up into an ironing-board, was not put to a more promiscuous and miscellaneous use than are some specimens of ornamental art in the hands of an amateur designer. "Pray you avoid it." The untiring examination of ancient skill and patience that I would press upon young students of design and embroidery, too, is not, let me repeat, for the purposes of copying, or adapting, or even faithfully reproducing, the old stuff itself. We have had too large a dose of sham Gothic in our architecture, sham Greek, and sham Roman too, and in my special department of the arts I am very anxious to put in a plea for spontaneity of some description, however unpretending. No, if the tendency of such study is to keep the taste of students in a groove, rejecting everything outside, they had better leave it alone altogether. But one expects and hopes such study to be pursued critically first; the reverence can come in afterwards, if by comparison and consideration, and generally speaking, by the light of ordinary intelligence, they find what they have looked into worthy of reverence. And take anyone who laughs at Mediæval draughtmanship as a grotesque and affected travestie of nature to the British Museum, and show him some of the finest specimens of 13th or 14th-century MSS., with plenty of red and blue penman's work in the borders. If he is an artist, ask him to draw you a dog with a curly tail in six strokes of the pen, and make it look as lively and full of devilry as any of the hundreds of animals in the work before him. If he says that he is a figure-painter, and has not made a study of animals, you can point out that the Mediæval artist could draw one as easily as the other, and thought no more of depicting King David with his harp than the little bear standing on his head on a hill, that I mentioned the other week. He will then most likely remark, with quiet scorn, that he considers the little brown bear low, and only fit for a comic page in *Pick-Me-Up*. At this stage of an argument one usually changes the subject, for a person who makes up his mind not to be amused or edified one day (and how well I know this perverse frame of mind!) may on another occasion, if treated with *finesse*, relent, and be prepared to allow that you may be in the right. For I am very much convinced myself, and therefore anxious to convince others, that Mediæval draughtsmanship, whether in an MS., or round a carved frieze, or on a "storied" mantle, was extremely naturalistic in the right way, and that when we can't sympathise with it, it is —I won't say our fault—but because of the difference in the point of view, and by no means because the Mediæval conception or execution is wrong. It is useless for me to say that a thing is right because I, through temperament and education and a hundred other reasons, like it. But it is reasonable to point out that such and such qualities exist in it, and that they overbalance such and such defects. I will not venture nearer than that to an assertion of the absolute in art!

An unsympathetic cousin aged twelve, in what I should think must have been his only moment of inspiration, once so far forgot himself as to call me a "Mediæval brute," owing to the cut of my youthful frock, which was unfashionable in those days. But I don't want you to take me for an incorrigible Mediævalist. To place an age which is behind us beside the present age, and favourably compare it, under all its aspects and with all its tendencies, is just about as unintelligent as the spirit which used to nickname an interesting period of history the Dark Ages; but one must admit qualities in the work of those times that no longer exist. With the change, the point of view is changed. The Academician cannot always enjoy the dignity of an ancient story seen through the naïve and earnest eyes of the Mediæval artist; but, so far, I do not think he has anything better to offer in its place. Certainly I like a clever, well-drawn street advertisement as well as anyone, but I rather think it is the blackguard side of me that enjoys the blackguard and artificial prettiness of these things; another side of me seems to want great purity of line, and an epic simplicity of design which the art of the street cannot supply me with. *Soyons de notre siècle*, and let us make the best of it, too, but while my Venetian and Ravennese peacocks drink at the fountain of life, or peck at the eternal tree, while the great warriors Roland and Oliver solemnly stand guard each side of the portals of Verona church, while the great dalmatic of Leo, third of that name, lies in its quiet place in the Sacristy of Peter at Rome, I beg, like the Goth that I am, to be allowed to love these things, and to project myself while thinking of them, into the queer days that engendered them, with their jumble of splendour and hardship, folly and wisdom; to lose my hold on modern life for the moment, on County Councils, School Board, the Woman Question, and Progress generally, and to forget—

> "Six counties overhung with smoke,
> Forget the snorting steam and piston stroke,
> Forget the spreading of the hideous town;
> Think rather of the pack-horse on the down,
> And dream of London, small, and white, and clean,
> The clear Thames bordered by its gardens green."

The moral of this rambling—for I am drawing to the close of my story and must make a "good end"—is that design, to be memorable, must have study of nature and knowledge of history behind it. The study of nature makes you bold in one direction, and the study of history in another, and without boldness the artist is as a leaf in the storm. An amateur may feel timidly that this or that is right, but could not say why, and dare not express what is in him for fear of offending against the canons of art; but the artist who has the certainty of knowledge within him will trample his own way through the canons and come out victorious in the end, and write his own page in the many-sided history of art, which is, in all its multitudinous forms complex and simple, a manifestation of Nature's effort and repose, the History of Life itself.

◆

GREAT NIAGARA TUNNEL AND WATER POWER.

By an Act of the New York Legislature, the Cataract Power Company obtained powers to construct a tunnel at the Niagara Falls for the purpose of creating a water-power of 100,000 horse-power, with option of duplicating the same. The Dominion of Canada also gave the company power to put a third tunnel on the Canada side of a still greater capacity than both combined on the American side, of 250,000 horse-power. In a paper read lately by Mr. Emile Geyelin at the Engineers' Club, Philadelphia, the engineering features of this work are described, and the construction of certain turbines recently put into operation. This tunnel is to serve as an outlet of the waters from future great hydraulic motors, and is, in fact, nothing more than a waste-way for the waters from the turbines from which the great power is to be obtained. The tunnel is lined with two thicknesses of brick, laid in Portland cement. It has an interior area of 314sq.ft., and a total length of 6,200ft. It starts about 4,200ft. above the Falls from a depth of 145ft. below the upper level of the Niagara River, and by varying incline terminates at about 50ft. below the new Passenger Suspension Bridge 250ft. below the cliffs of the great Falls. There are six turbines, each of 1,100H.P. under 140ft. fall; each of them has an efficiency of 80 per cent., and requires 5,200c.ft. of water per minute, or a total of 31,200c.ft. The motion is transmitted by means of upright shafts and bevel wheels to three horizontal shafts, each making 200 revolutions per minute, placed 154ft. above the lower level. Those interested in the details of this great work will do well to read Mr. Geyelin's paper in the *Proceedings* of the Engineers' Club of Philadelphia. The author states: "The turbines are performing the full duty they were intended to perform, the bearings are cool, and the gears show no sign of weakness or tremor. The water, as it leaves the turbines, falls over the sides of the casings, its terrible force wholly spent on the wheels."

◆

A FURTHER NOTE ON SEWER AIR AND SEWER VENTILATION.

By Robert Harris Reeves, C.E.

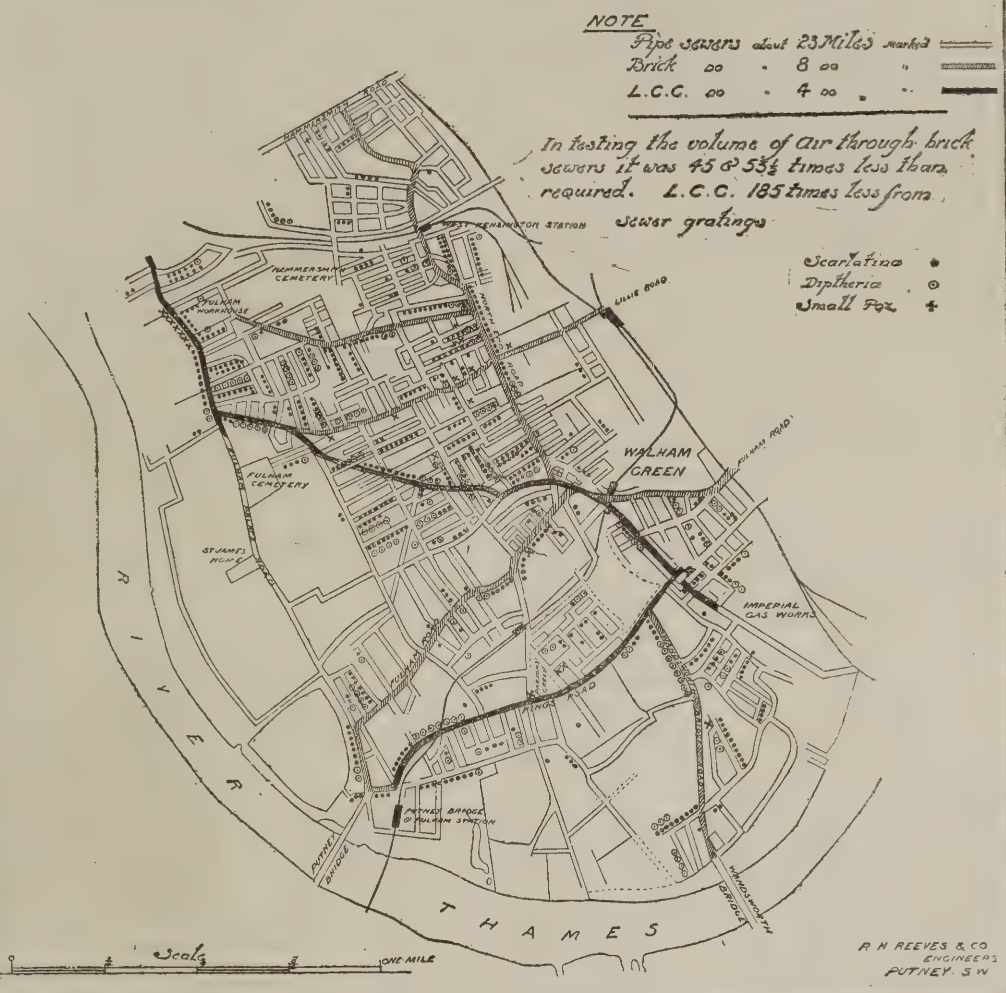
Since the publication in June last of my pamphlet, noticed in this journal on July 6, entitled "Reports and Investigations on Sewer Ventilation," I have added materially to the weight of evidence in favour of the views I therein ventured to set forth. I have prepared a plan of the sewerage of Fulham, and, following the excellent report of the medical officer for 1893, I have located thereon all the cases of disease according to the streets in which they are stated to have occurred. A reproduction of this chart on a reduced scale is given on p. 279.

There were in all 30 cases of small-pox reported, denoted in the plan by X, 4 of which proved fatal; 230 cases of diphtheria, denoted by , 55 of which proved fatal; and 701 cases of scarlatina, denoted thus ., 43 of which proved fatal. And on reference to the chart, it will be seen that the worst cases lie along the line of the sewers which, as a matter of common knowledge, give off the worst gases; whilst it will also be apparent that this chart in a general, but none the less striking, manner illustrates and enforces the truth of the remarks I made when dealing with the sewerage of this district in pamphlet, page 13. I there showed the degree of unsanitariness of the pipe sewers, of the branch and main brick sewers of the vestry, and main sewer of the London County Council, when I stated that they had respectively 7½, 45, 63½, and 185 times less fresh air passing through the gratings than the amount required. It is clearly evident from all this that disease follows the path of sewer gas; but these 961 cases of disease were, according to the highest medical authorities, preventable. Why, then, were they not prevented? On whom lies the responsibility of their occurrence? How are they to be prevented? It is for others to answer the first and second of these questions, but I answer the last by saying: Get rid of the sewer gas, and preventable diseases disappear in proportion as you are successful in doing this, and that this is a comparatively easy and inexpensive thing to do.

THE SMALL-POX OUTBREAK AT MARYLEBONE.

In my pamphlet I suggested the following as a solution of the problem as to how outbreaks of zymotic diseases originate—viz., that the germs of zymotic diseases are always with us; that under certain conditions they are harmless, but under certain other conditions they become most dangerous; that sewer air produces an atmosphere most favourable to their becoming dangerous, when by

PLAN SHEWING ZYMOTIC CASES IN PARISH OF FULHAM IN 1893



their action on water, milk, and other food they lower the system until it yields to their attacks and disease develops. Several medical men have adopted this theory as the basis of their opinion on the origin of outbreaks, but the medical opinion generally still is that they originate by "infection." On the "infection" theory the origin of the outbreak in Marylebone has been attributed to one case which remained unisolated from the 2nd July to the 5th July, and from that one case 139 cases were notified as occurring between the 23rd and 31st July. By way of explaining how that could be possible, it is stated that "small-pox is liable to be carried by money, by goods, by personal contact with those nursing the sick, and in a variety of insidious ways not easy to follow or trace." This is not very definite and not very convincing, and does not satisfactorily account for the fact, as alleged, that from one case 139 individuals derived the disease, many of whom, if not the most of whom, had no connection by space or any admissible circumstance with it; and if the "infection" theory appears so weak when looked at in view of the almost instantaneous appearance of so many cases, it becomes more so when viewed in connection with the expected second outbreak, which happily did not occur. On this point the official report merely states, "that the small number (of cases) up to date (17 days after the second outbreak was expected) of what might be called the 'second crop,' was remarkable. It went far to show that the early period of small-pox, before the eruption maturates, was not one of strong infection." Further on, I shall show inferentially that this is a sound conclusion as far as it goes, and that it inevitably leads to the final conclusion that the "infection" theory, as at present understood, must be abandoned altogether. I now proceed to state, in necessarily brief terms, how in my view the Marylebone epidemic originated; and in doing so I am merely applying the principles I laid down as to the origin of all zymotic epidemics, not only in my pamphlet referred to, but in the paper I read before the Congress of the Sanitary Institute at Worcester in 1889, and again in the volume entitled "Sewer Ventilation and Sewage Treatment," published four months thereafter. Under certain conditions gases would accumulate in this section of Marylebone sewers which would become exceedingly foul, and under certain other conditions, which must sooner or later supervene, these gases would be forced out into the street and into the houses. From the published meteorological data which govern the production and dispersion of dangerous gases, and from my previous knowledge of the sewerage of the district, I can show that the conditions, which in my view would produce an epidemic of zymotic disease, actually occurred in Marylebone, within the limit which Dr. Winter Blyth fixed, on medical grounds, as the time that "infection" must have taken place. From June 22nd to July 7th, I find that the sewage in the district kept its normal flow, the weight of the gases on the surface averaging 15gr. per cubic foot less than the weight of those in the sewers. In these circumstances, for about fourteen days there was practically no aëration of the sewer gases going on, which would thus, at the latter date, be composed of 50 per cent. of gas which bubbles from the sewage, and 50 per cent. of air from the surface, so that such gases as emanated from the gratings at this date were of a nature that must have lowered the system of anyone who inhaled them. On the 11th July rain fell in excess, causing a great outflow of this dangerous mixture by the gratings, with the result that on that day, the whole atmosphere of the district was charged with it. Dr. Winter Blyth, on medical grounds, puts the date of the "infection" between the 5th and 15th July. On sanitary grounds, and without accepting the word in its present medical sense, I confirm Dr. Blyth's date as to the "infection," but more definitely fixing the 11th, the meteorological conditions of the day, taken in connection with the previous state of the sewers, being responsible for the outbreak. On the 11th and 12th July small-pox was in the air at Marylebone, and those otherwise liable yielded to the attack. This is the simple explanation of the rapid spread of the disease. Then as to the non-recurrence of the expected "second crop" of cases. The excessive rainfall of the 11th, which had brought the bad gases out into the streets, was also to a great extent the means of temporarily freeing the district of their presence, and this fact, along with the prompt and almost universal measures adopted by the responsible authorities, produced an atmosphere in which the germs could no longer be epidemic, and hence there was no second outbreak. In my pamphlet, at page 11, in describing the ventilation of the sewers adjoining this district, I show amongst other things that the volume of air passing the gratings of a specified section of the Marylebone sewage was 97 times less than the quantity required, and that this section, which was connected with the main sewer of the London County Council, was receiving large quantities of foul gases from that source. As these sewers are of large sectional area, a considerable proportion of the gases they contained at the date of the rainfall on 11th July would probably not be thrown out on that date, and consequently further cases would naturally occur in or near this locality. The volume of sewage gas—viz., that which bubbles from the sewage in transit—is 3,000,000 cubic feet daily over the London area. This volume is supposed to be mixed with fresh air through ventilating gratings, so as to be non-injurious to health. This theory is wrong, for, as has just been stated, on the Marylebone district, where small-pox is very prevalent, we get only 1-97th the quantity of fresh air into the sewers necessary to render them non-injurious to health—and, in varying degrees, this is the state of matters over the London area generally. From daily meteorological and atmospheric observation during the last five years, epidemics in London are seen to follow the storage and discharge of sewer gases as correctly as storms follow meteorological variations. Gases of greater density are to be found in large sewers more now than in previous years, and the reason of this is that, when sewers have been ventilated through the surface of the road, the gases have thus become a nuisance, and the gratings were in many cases stopped up, and shafts erected. This removed the nuisance from the streets, but gave a worse gas in the sewers, consequently more sickness. Although it was against all laws or rules laid down for out-ventilation and the diffusion of gases, it was believed in, and advocated, simply because the complaints of nuisance in the streets ceased. A few months ago, a surveyor of a large district decided to test for himself my statements, and we measured the working of two shafts, with the result that for three-quarters of an hour not a particle of air went up or down them. Being thus convinced, two series of tests were made, on his and another district, the publication of which, when completed, will be somewhat startling, but bearing out my previously-published statements. But the question may be asked, Why should the Portland Town districts more than others be visited by the epidemic-producing gases? This is explained by the fact that gases of very strange composition are at all times floating about in our sewers, and that a volume of gas was in this district that would develop small-pox, and was discharged on July 11. For example, Mr. Parry Laws, F.I.C., in the London County Council Report, states that he found a sample of air from the London County Council sewer in the Fulham district to contain 93·10 vols. carbonic acid per 10,000 vols.; and Mr. Clayton, public analyst for Fulham, found a sample of the air from the large sewers to contain 4·5 per cent. of carbonic acid and ·07 per cent. of ammonia. But it does not come within the scope of these brief remarks to enter upon this branch of the question. My point at present is to enforce the practical sanitary lesson to be learned from the facts established—namely, that in one way or other zymotic diseases follow in the path of bad sewer ventilation, and that, conversely, perfect sewer ventilation is the only safeguard against their recurrence.

◆

THE PLANNING OF HOSPITALS.*

One cannot speak properly of the planning of hospitals without including much that does not strictly come within the province of the student of architecture. You will pardon me, therefore, if I open these remarks with statements and explanations bearing upon the subject which are derived from such medical authorities in hospital science as are well known to fame in this connection. What follows is not said to undervalue the work which has been done by the medical specialist, but to awaken thought in a new direction for the benefit of our own profession, to whom the business of designing all kinds of buildings legitimately belongs. One of the objects of this lecture is to suggest to the young minds before me the possibility of an improvement in hospital building, which would spring up if the architect should so fit himself by early and careful training for the special work of designing and constructing hospitals. Granted that a hospital is a machine, if you will, it seems reason that it may be and ought to be an agreeable looking machine, and that there is nothing in Nature or art to prevent the architect from understanding and producing it. Whether working with a specialist, or as a specialist, it becomes the architect, who must remain the authorised interpreter to the workmen of all drawings and specifications, to know the value of and the reason for every line and every word that they contain. Furthermore, he is often called upon to be accountable, and sometimes the accounting head, in carrying on the works. Over and above all these points, he has the artist's responsibility in the case, to give the building or group of buildings whatever of artistic character may be possible, or, under the most unfavourable circumstances, to see that the result shall not develop as a blot or an eyesore. The history of hospitals up to recent times is rather mythical; Egypt, India, Greece, and Rome are all said to have had something of the kind. While the subject is one of great interest, there is too much of uncertainty and mere conjecture surrounding it to yield much profit to the general student. You will find about all there is to be found, and more than is valuable, in Burdett's book.* The English word "hospital" has been, and still is, used in a double sense—viz., "As a place of medical treatment, and also as a retreat for the poor, the infirm, &c." ("Encyclopædia Britannica"). Burdett in his great book uses two terms—the title is "Hospitals and Asylums of the World." The late Dr. Kirkbride deviated from the English nomenclature with regard to establishments for the care of the insane: these in England are usually called "asylums." Following Dr. Kirkbride, the term "Hospital for the Insane" is generally used in this country to indicate that the institution is for the purpose of treatment of insanity as a disease with a view to its cure, and not as a mere shelter for its inmates. What I have now in mind to speak of more particularly is the hospital for the treatment of the sick and wounded. Originally the word hospital meant, as the word asylum now means, a place of shelter for the poor and helpless only; now it has the included meaning of treatment and restoration; the inmate of an asylum may or may not be a patient, the inmate of a hospital proper is always a patient, and the rich as well as the poor avail themselves of the benefits of hospital treatment. There is good reason to believe that in many cases, especially those of a surgical character, a well-organised hospital possesses great advantages over the best equipped private house. All difficult and dangerous operations can be there performed under conditions more favourable than at home. So that the hospital manager, the doctor, and the architect must work together to improve this life-saving and life-lengthening apparatus, and the best-equipped man for the work ought to be the architect. It is only within comparatively recent years that scientific progress has been made in the organisation of hospital management and the construction of hospital buildings. France appears to have taken the lead; but England and America are now well abreast, if not ahead. The old Hôtel Dieu at times during the last century held 5,000 patients. As many as six people were laid in one bed. The buildings occupied only a little over three English acres, so that each inmate of this "House of God" was allotted only about thirty square feet of the earth's surface whereon to live and breathe. You will better appreciate the extent of this crowding when told that each inhabitant of the City of Paris has 430sq.ft., and of the City of London about double this area, or over 800sq.ft. There is some satisfaction in knowing that the present Hôtel Dieu gives each patient 311sq.ft., although this is a very short allowance according to the present advanced idea of the proper ratio. The earliest record of hospital building in England states that in the 11th century two were founded by the Archbishop of Canterbury, Lanfranc by name. About fifty important hospitals were founded in England, Ireland, and Scotland during the 18th century, which shows a wonderful movement in the intentions of benevolence. The earliest hospital in North America is the Hôtel du Precieux Sang, built in 1638, and the next in order of time the Pennsylvania Hospital in Philadelphia, the east wing of which was built in 1755. Before the Revolution of 1789 the French had begun to devise special plans, but that terrible event intervened, and no tangible improvement grew out of their thought and invention, until the Lariboisière was begun in the reign of Louis Philippe. Singularly enough the Revolution of 1848 interfered with the building of that, and it was not completed until the year 1854. When the Episcopal Hospital in Philadelphia was designed in 1859, the Lariboisière was considered by its projectors as the best existing model to be followed. I may say that it was not strictly followed; but in all essential features it is probably the best hospital building which was erected at or before that period. Its benefits came into full play in our Civil War. The plans of the Johns Hopkins Hospital in Baltimore, recently published by Dr. Billings, illustrate more fully than any other yet built the thorough study of the subject which is being given in modern times. It is in effect from the medical point of view an ideal hospital. No thought, time, trouble, or expense was spared to make it so; to carry into practice the most advanced ideas of hospital design and construction. I shall refer to this frequently, as it is a convenient landmark and object lesson. There can be no objection to doing so, as the plans by their publication have become common property. If a copy of Dr. Billings's book is not already in your library, it ought to be placed there. In the Johns Hopkins Hospital, beyond the administration and pay wards, it is difficult to discover the touch of the artist. Architecture as an art seems to have been subordinated to the demands of hospital science, and any thought of architectural beauty in the treatment of the external appearance of the common wards particularly ignored. I wish to suggest the point that there are no compelling requisites of size, proportion, or detail in hospital plans that may not be softened and rounded by artistic care, so as to give token of regard for beauty. Passing by the collateral needs, all of which enter into the planning of hospitals, such as the departments for administration, for clinical teaching, for training of nurses, for out-patient service, for isolating purposes, for the pathological work, for cooking and washing, our present business will be with the arrangement and construction of a proper hospital ward, with its inseparable adjuncts. A room furnished with a bed or beds to receive patients is called a ward. For many reasons it has been found satisfactory within economic limits to place from 10 to 30 patients in one room, and this room is called the main ward, and if the hospital contains more than one they are numbered 1, 2, 3, &c. They are also spoken of by the attending physicians and nurses as medical ward, surgical ward, &c., according to the use. But it is not necessary to make this distinction in connection with planning. The needs of a surgical ward are the most exacting; if we plan properly for that, we shall cover the ground for all requirements, except for cases where special isolation is required. In the Massachusetts General the Bradlee ward is designed on isolating principles, a special ward for abdominal and cerebral cases. But I wish to confine your attention just now to that unit of a hospital which is, or should be in emergency, a complete hospital in itself, and is called, for convenience, a pavilion. This consists of two parts, the main ward and the head-house, as well separated from each other as the nature of their relations will permit. Under certain regulations it is now conceded that another ward and head-house may be superimposed, making a two-story pavilion. There has been much discussion as to the advantages and disadvantages of two-story pavilions; there was a period when the authorities told us that the one-story only could be the proper thing. The Johns Hopkins built some of each, and it may be supposed is now making a record of comparative results. We will consider now the main ward. Its floor-area should have a minimum of 100sq.ft. per bed, and it is believed that no ward ought to have over thirty beds. If we fix the clear height at 12ft., which is probably the minimum that should be allowed, we have 1,200c.ft. per patient. This is a fair standard of practice in the climate of Philadelphia, provided reasonable attention is given to the means of winter ventilation. The glass surface for the windows should not vary much from 20sq.ft. per patient, although this may be considerably decreased in more northern latitudes and on stormy exposures. The usual form of the ward is an oblong parallelogram of about 25ft. in width; this is enough when 8ft. length per bed is allowed. Some have been made of greater width. The Johns Hopkins wards are 28ft. wide, with 7ft. wall length per bed. The wards in the Episcopal Hospital are, I believe, fully 30ft. wide in the clear; but this width in a long ward is now considered excessive. Some of the modern English hospitals have very pretty circular wards with ventilating stacks in the middle, and it is a matter of some surprise that octagonal wards, such as one built in the Johns Hopkins, have not been more usually adopted. In the Massachusetts General, built in or about 1820, the wards are nearly equal-sided, with a great chimney-stack in the middle. A modification of this, except that the sides are extended and the corners are cut away to form an irregular octagon, may be seen in the new wards of the Pennsylvania Hospital. These wider wards with the central chimney, whether square, round, or octagonal, present some marked advantages in the matter of ventilation, and are especially desirable when there is a superimposed ward. Later on, I hope to recur to this. In choosing a hospital site, the quality of the soil, the facility of water-supply and drainage, should be carefully attended to. But an important care and duty of the architect is to regulate the orientation of the wards. These invariably ought to be placed on the south side of the connecting corridor, and when oblong should have the axis as nearly on the meridian as possible. Thus every day of the year in which the sun shines, at least three walls of a rectangular ward will be bathed in sunshine. This is good for the patients, good for the building, good for warmth, and good for ventilation. With the orientation just described, the interval between wards may be smaller than in any other. Thus, if a one-story ward be 14ft. from the first floor to the eaves, the space between wards may be 28ft. If there is a superimposed ward, this interval should be much greater. As the ward is the essential part of the hospital, it has claimed our attention thus far. But food, clothing, water, and drainage are important, and must be available in a hospital, as elsewhere. A section of the pavilion is isolated as nearly as possible from the ward by the cross-corridor, through which, as often and as long as possible, fresh outside air is allowed to pass. On the north side of the corridor, supposing the orientation to be regular, is placed the head-house, containing the numerous adjuncts which go to make each pavilion a complete hospital in itself. Here are placed the stairs, the service-room through which is served all food (which comes, in a large hospital, from a remote kitchen by way of the basement corridor), the clothing room, the linen room, the nurses' duty room, the bathroom, the water-closets, and, if practicable, one or more special rooms or wards for single beds. All the water fixtures are arranged for special artificial ventilation separate from the ward ventilation. Keep fairly in mind that the governing thought, difficult to put into execution in our climate, is primarily to isolate the ward, by means of air currents, from the head-house, and each pavilion from its neighbours as much as possible; and that inside of the head-house (or outside of it, as you may sometimes find it necessary) the drainage fixtures must be further isolated by a well-formed air-passage, flushed as frequently and as much as possible with fresh external air. Another help in natural ventilation is the peculiar window which has a transom at 2ft. from the top, the sash of which is hinged at bottom to open inward to admit fresh air at the top, which is thus admitted and impelled in mild weather into the room toward the ceiling, without danger of too much draught on the patient. You may find under some conditions that it will be necessary to control the ventilation, especially in winter, by fan pressure; but this should not happen in a new enterprise, where the conditions of selection of site and orientation can be controlled or regulated. But you will be called sometimes to enlarge, alter, or extend existing hospitals, and you will then be glad to draw on all resources within your reach. It will generally be found best to construct a large single ventilating flue for each ward with openings into it at floor and ceilings. This is rendered active by a coil of pipe heated with steam all the year round. Such a flue cannot be placed within the lines of the long, narrow yard, but may be placed in the head-house or lobby, as in the Johns Hopkins. It involves long ducts both under and over the ward, and places a serious difficulty in the way of a second-story ward. Owing to the great length of the horizontal ducts and branches, it would seem that the effective draught would differ much between the near and distant parts of the ward. In the wider ward having a central stack, such as the octagonal wards of the Johns Hopkins, the square wards of the Massachusetts General, and the wide Memorial Wards of the Pennsylvania, the central ventilating stack will undoubtedly perform more thorough work in a more economical manner. The steam pipes and coils are made accessible by means of a ladder from the basement to the attic. A separate flue the same description, in which steam, water, and drain pipes are placed, ventilates the water-closets; the other parts of the head-house are ventilated by flues, collected into a separate common head, having steam coils like the rest. Volumes have been written on warming in connection with the subject of ventilation. Merchants, manufacturers, doctors, lawyers, and engineers, from time to time, have burdened the world with new books. It is nearly safe to say that nobody in a northern climate has ever been thoroughly and continuously satisfied with his warming apparatus; so I will not startle you by saying that such a hospital or such a house has a thoroughly satisfactory apparatus, What is to be brought forth hereafter in electrical invention no one can safely predict. Nothing yet has appeared to supersede the appliances through which steam for fifty or sixty years past has been found clumsily effective. At the Johns Hopkins both steam and hot-water appliances are put in. This has been done to solve experimentally the question as to which is better. In the other hospitals within my knowledge steam alone is applied. Almost invariably cast-iron radiators, which now largely take the place of the old pipe coils, are placed in the basement, at the bottom of the hot-air flues. Fresh air brought from the outside at least 6ft. from the ground passes over these radiators, and, becoming warmed, is discharged through metal-lined flues into the ward or wards above. The area of these flues is reckoned for this latitude at about 100sq.in. per patient, and the area for ventilation, by the means already referred to, should not be materially different. An important feature in any method of warming is the management of the admitted air. Whether the winter weather be cold or mild, the inflow of air to the ward should be kept as nearly as possible to the same volume. This is done by a mixing damper, so placed that by a single movement the flow of hot air is diminished, the flow of cold air is increased; the two volumes thus thrown together, mixed and tempered, are delivered into the ward. By means of an actuating chain or rod, this movement of the damper is performed by the nurse without leaving the ward. With this tempering arrangement for inflow, and proper openings for outflow at floor and ceiling—those at floor are always open, those at ceiling controlled by registers, so that the air may be changed and the temperature promptly lowered on occasion—extraordinary care is not required to keep the ward at the proper temperature. I ought to mention that the inlets for warm air are better placed under the windows. The windows are the coldest points in the room, and as the greatest space between beds is opposite the windows, the danger of draughts on the beds is thus minimised. In speaking of the construction of the hospital, I will refer only to such features as are especially important in this class of building. Of course, hospital construction in most particulars may be, and usually is, the same as in other buildings of the better class. The foundations should be laid with stone and cement, and there should be a damp-proof course of asphaltum or slate at the ground line. In some soils the foundations should be drained with tiles; in those of sand or gravel this is not necessary. So far as is ascertained, there is no better material for walls than brick. All interior partition-walls ought to be brick. The weather-barriers should be formed of two 9in. walls with 2in. air-space, well bonded at all jambs and corners. An excellent alternative is an 18in. solid wall with hollow lining of terracotta, whereon the wall-plaster is laid. Either of these devices will insure dryness of the internal wall-surface. A principle to be followed as carefully as possible in hospital building is to leave as few cavities in the construction as consistent with the conditions of integrity and endurance. Every surface should be solid and smooth as practicable, and thus easily and freely cleansed and kept clean. When floors are constructed in the usual manner, the intervals between joists may be filled with mineral wool. This helps to deaden sound, leaves no harbour for rodents, or any other offensive thing. Still better, where the appropriation of funds will permit it, the floor should have bones of iron or steel filled-in with bricks. The nailings for the surface-floor will thus rest on a bed of iron and burnt clay; again the mineral wool comes into play between the nailings or sleepers. The surface-floors must be hard wood; nothing is better than the Southern yellow or pitch pine, which, when cut and dressed to show the edge-grain, makes a handsome and most serviceable floor. A good, tight, smooth, well-finished floor is most important; paraffin and soluble-glass are recommended as coatings. The joining to the wall is best with a neat wooden cove, the usual high wooden base-skirting being omitted. In fact, only such inside woodwork as is absolutely necessary is recommended in the best hospital construction. The window-jambs and heads may be rounded or chamfered in plaster, and the window-sills rubbed slate. The floors and parts of the walls of the water-rooms are lined with pottery tiles, and all angles give place to curves, concave or convex. It is best that stairs shall have iron construction, and if slate-treads come within the appropriation, they are to be preferred to wood. The plastering of the walls and ceilings should have great care betowed upon it. The surface should be left with what is known as hard-finish, composed of lime, sand, and much labour. Where laths are commonly needed, such as on ceilings, &c., stiffened wire-netting should be substituted. At all internal points, and in all materials, whether stone, brick, wood, pottery, plaster, or metal, constant attention should be given to the avoidance of open joints, sharp corners, quirks, and creases. The exclusion from the interior of the ward of all architectural decoration may be a part of the reason why in recent times there has been a disposition to exclude the architect himself. If I have seemed to take up much time in dwelling on what might be called the peculiarities of hospital building, I assure you I have done so with the general purpose of outlining the subject, as it were, by simply touching on some of the details in a way that may attract your attention, with the thought that some of you might in the future take up the designing of hospitals as a speciality. Be assured that the subject is a large one; thousands of volumes have been written upon it; new discoveries in medical and surgical science are modifying the older theories, so that one needs to keep abreast with daily progress. For those who have a certain combination of mechanical with artistic genius, it would certainly prove exceedingly interesting, and possibly profitable in fame and money. The increase of material wealth of the people of this country, the inevitable poverty and suffering which travel on foot alongside of the chariot of wealth, are the two factors which will more and more conduce to the founding of institutions for the charitable care of the sick and suffering. Then, as science prospers, and proves what it is capable of in healing and minimising pain, the rich and well-to-do will patronise such establishments in which they can be better relieved and cured than in their own homes, and will add liberally to the means of supporting them. I am the more moved to speak as I do, because some of the medical advisers have strongly intimated their disregard for architectual beauty, as if it were not worth an effort. I plead that the skill of the architect can modify the appearance of almost anything having walls, windows, and roof, so as to render it a thing inoffensive, and with perhaps a slight addition to the expense, a thing of beauty. M. Tollet, a French writer on hospitals, thinks that the Ogival or Gothic form of architecture was adopted in the Middle Ages as much for sanitary as for architectural reasons. Whether he be correct or not (it appears to be a conjecture only), this writer sees no objection to its use, except that it does not seem to lend itself so readily to the rigid conditions imposed by modern sanitary science. But there is one point worth noting in regard to this. Doctors, for a wonder, do not differ in their recommendations for top ventilation; in one-story wards this easily becomes what is termed ridge ventilation. In all wards it is very desirable to slope the ceiling upwards from the sides to the middle. So that we have in the ceiling of any ward, especially in the one-story ward, a hint of Gothic which might well be followed in the external architecture of the building. If one were requested to design a hospital group in the Gothic style, he should not seriously resist the pressure to do so; it is possible to do it without trespassing the code of hospital science so far as I know it. One should be allowed and should take much freedom in such an instance; he would be glad, of course, if the state of the treasury would admit of stone as a material for external walls. But if you ask what type of architecture appears best suited or most adaptable to beautifying the hospital, I am obliged to answer—a modified Renaissance or some derivative of Classic; that is, so far as detail is concerned. There can scarcely be such a thing as perfectly regular or symmetrical handling of the voids and solids, as is necessary to give the best developed results in Renaissance. You are obliged to submit to certain irregularities of plans and arrangement of openings, because the wants of the interior are dominant, and interfere with the symmetry required in the perfection of the Renaissance. The combination in the same view of the wards, which are large, with the rooms of the head-house, which are small in plan, but for working reasons must be high in story, adds to the difficulty of designing a building to show the regular and symmetrical beauties of Renaissance work. The solution of the question as to what is best can perhaps be nearly reached by recognising the difficulty fairly, and approaching it in the most direct way. In a hospital group there are some parts, notably the Administration building and the pay wards, the requirements of which do not suffer by compromise with the demands of external symmetry. These and certain portions of the wards and head-houses may have regularity of design. (It seems unfortunate that the most satisfactory story heights for sick wards are not sufficient to permit mezzanines in the head-houses.) For the rest you perforate the walls at such points as you must, and rely on horizontal courses and minor details of the cornices and windows for such effects as will make harmony with the richer parts of the design. It does not seem good judgment to leave the walls of the wards and head-houses so bare and devoid of architectural interest as those of the Johns Hopkins are, especially as they front and are seen from a beautiful park, and every ward is visible from its neighbour. It seems to me that the patients and nurses should have something more interesting to look at than naked walls, which might be, for any external sign that they give, those of a warehouse, and chimneys which might be those of a chemical laboratory. But I must close. I feel that I have only hinted at the thoughts and things which enter into this very interesting sort of building. But if I have awakened in some of you the desire to know more of the subject, I have accomplished all that could be expected within the allotted hour. I will name three books (I might name ten or twenty; but naming the three, you will have a guide to all the others), in which you can find the book knowledge upon which you can start the structure of your equipment for hospital work:—Burdett's "Hospitals and Asylums of the World," "Encyclopædia Britannica," "The Johns Hopkins Hospital." The Middle Ages were the cathedral-building centuries. The 19th century is the era of railroads and high buildings. The 20th century, with the growing tendency of the strong to help the weak and unfortunate, coupled with the ability to help them, may prove to be the age of scientific healing, and more universal, enlightened, benevolent, and charitable work than has ever before been seen in the world. Along with this will undoubtedly grow the love of all beautiful things in nature and art. I can think of no nobler work for you to engage in, those of you who may feel drawn in this direction, than that of preparing to take a part in bringing about this great consummation. If any of you do, I trust it will be with high aims, and with the feeling that this is something better than a railroad building, shall I say better than the Crusades or cathedral building, or any other demonstration of enthusiastic building, that ever took place for the good of man or the glory of God? Every work that is done, in the spirit that is now abroad, for the amelioration and relief of human pain, is a step towards the Millennium. The hospital, which was once a pest-house, and, in a measure, a curse, although founded on the best instincts of humanity, will, in the course of the future become without doubt an unmitigated blessing, a veritable Hôtel Dieu, a "house or hostelry of God."

PROPOSED ROMAN CATHOLIC CATHEDRAL FOR WESTMINSTER.

MR. J. F. BENTLEY, as we announced several weeks since, has been intrusted with the preparation of the plans for the new Roman Catholic cathedral which is to be erected at Westminster. Both in the matter of splendour and size the new cathedral is to be the most important ecclesiastical edifice erected in England since St. Paul's was built. The style of architecture to be adopted is one almost unknown in this country. The proposed building will, moreover, be the first in England since the Reformation in which the full Roman Catholic cathedral service will be daily celebrated in all its splendour.

It was at a public meeting held in 1865, upon the occasion of the death of Cardinal Wiseman, that it was decided to perpetuate the memory of his services to his church by the erection of a Roman Catholic cathedral for the Metropolitan See Subscriptions and donations flowing in, Cardinal Manning was ultimately able to purchase for £55,000, as a site for the cathedral, a valuable freehold property of 4½ acres, formerly occupied by the Bridewell House of Correction, Westminster, and close to Victoria-street. The property has since increased in value to £300,000, and is now entirely free from debt. Cardinal Manning did much towards the project; if he did not do more, it is to be attributed to his zeal for the poor. Cathedrals are costly structures; and the good Cardinal could not find it in his heart to appeal for money to lavish on elaborate architecture when there was so loud a call to minister to the physical wants of the poor and needy, and the industrially oppressed. In addition to the price paid for the site, the new cathedral is estimated to require at least £250,000 to build.

The next feast of St. Peter and St. Paul—June 29, 1895—is expected to witness the foundation laid. Meanwhile the project has sufficiently advanced to justify the employment of an architect to prepare the plans, and as there is no architect in England—or, perhaps, anywhere else—now living who has planned a church in the style decided upon, the selection of an architect was not a simple matter, especially as it is part of the plan to employ, as far as possible, only Roman Catholic natives of the three kingdoms. Mr. J. F. Bentley fulfilled the two conditions, and is well known in Roman Catholic circles as the architect of the Church of the Holy Rood, Watford; of Corpus Christi, Brixton; St. Mary's, Kensal; the Redemption Church and Monastery, Clapham; St. Thomas's Seminary, Hammersmith; Beaumont College, Old Windsor, &c., and on him the choice fell. Partly in order that the new cathedral shall not appear as an attempt to rival the neighbouring Abbey of Westminster; partly in order that the decorations may be concentrated upon the interior, so that they can be added to from time to time as means permit, and need not necessarily be completed with the building; and partly because the building itself can be erected for less money than if any other style were chosen, it has been decided to adopt the primitive form of Christian architecture—namely, the ancient Basilican style, taking Constantine's Church of St. Peter in Rome as the model, but without slavishly copying its defects; and it is suggested that the architect should "be guided in all details by the earliest known style of Christian ornamentation—viz., the Byzantine, modified, developed, and perhaps improved by its successor, the Lombardo-Romanesque." The exterior ornamentation will probably be almost exclusively confined to the façade. The concentration of decorations on the interior, besides permitting of the building being finished before they are, will have the further advantage of protecting them from the effects of the climate.

For the purpose of studying the ancient basilica churches of St. Peter, St. Paul, and St. Lorenzo, the architect, Mr. Bentley, is starting for Rome. He will also visit the basilica churches at Ravenna, Florence, and Constantinople, and will altogether be absent from England for some months before commencing his plans, which are to be ready next June. Until they are ready, it is impossible to say more exactly what the new cathedral will be like, except that internally it is to be 350ft. long by 170ft. wide—about the dimensions of Chester Cathedral—sufficient land being kept to extend the length by 100ft. more, if necessary, at some future time. The internal roof—which, it is hoped, will not be flat—will be 100ft. high. The cathedral will hold 10,000 people and seat 8,000, and attached to the cathedral is to be a lecture-hall seating 2,000. The Benedictine monks, who for centuries served Westminster Abbey, are to be invited to return and hold daily choral service in the new cathedral, close to which a monastery to accommodate thirty of them and forty-five lay brothers will be built; also a new house for the archbishop, provided sufficient funds be forthcoming. If the archbishop's present house were sold, its site is so large and valuable that, it may be suggested, the proceeds should be enough to pay for a new one, if not to build the monastery as well. After all this building has been done on the cathedral land, there will still be enough left which, if let on building leases, would yield sufficient endowment for all expenses connected with the cathedral.

Towards the building a single subscriber has given nearly £20,000, and sufficient funds have come in to enable a start to be made, but many thousands are still needed. The names of people giving £1,000 and upwards will be inscribed on the cathedral as its founders. It is proposed to address a circular letter in Latin to every Roman Catholic bishop throughout the globe, setting forth why, from the Catholic point of view, "the means to restore the beauty of holiness, religion, faith, and worship are lacking to the financially poverty-stricken Catholic Church in England." Whether this proposal will be adopted by Cardinal Vaughan is doubtful, as it is expected that the Roman Catholics in America and the colonies, who have not yet been applied to, will subscribe liberally.

◆

THE GAMBLE INSTITUTE, ST. HELEN'S.

[WITH PHOTO-LITHOGRAPHIC ILLUSTRATIONS.]

THE committee appointed to carry out this scheme received about thirty sets of plans from various eminent firms of architects in the country, and Messrs. Briggs and Wolstenholme, of Blackburn, were ultimately selected as architects to the committee. Their original plans showed a building four stories high, in addition to basement, but it was found that the erection of such a building would cost considerably more than the £20,000 which Colonel Gamble had placed in the bank to the credit of the committee. The architects thereupon prepared new plans for a three-story building, with basement, as shown in the sketch. The following is their description:—The main entrance to the building is from Hardshaw-street. The free library will occupy the whole of the ground floor, and be raised about 7ft. from the street level. The entrance will communicate with a spacious hall, behind which will be the lending department, capable of accommodating 40,000 vols., and divided from the hall by a counter 60ft. long. The whole of the frontage to Bickerstaffe-street will be occupied by the newsroom—114ft. by 32ft.; while the reference library—52ft. by 32ft., boys' reading-room—32ft. by 20ft., and girls' reading-room—32ft. by 18ft., will occupy the opposite wing; the whole being under the direct supervision of the attendants in the lending department. A private room for the librarian is placed between the reference and the lending departments. The entrance to the Technical School will also be from Hardshaw-street, and will correspond with the entrance to the Free Library, they being situated on each side of the central staircase. The technical director's office and waiting-room are arranged for on the ground-floor level, communicating directly with the Technical School staircase and the hall of the Free Library. The porter's room is arranged between the two main entrances overlooking the staircase of the Technical School and the hall of the Library. The basement floor will be devoted to the manual training room, building classroom, metallurgical laboratory on the Bickerstaffe-street side, with the plumbing classroom and engineering laboratory fronting Corporation-street; teachers' room, cloakrooms, &c., to Hardshaw-street. The centre of the basement floor will be occupied by a book store in connection with the library, and will communicate directly with the ground floor by a private staircase, and also have a small lift for books. A feature of this plan is a covered cartway in Bickerstaffe-street, through which all building material, library and other stores, and coals will be taken into the building. The rear portion of the cellar is devoted to the warming and ventilating plant, and is separated from the engineering laboratory by glazed screens. It will be lighted from the open space behind the adjoining houses, purchased by Col. Gamble for the purpose of permanently securing ample supply of light and air to this portion of the building. From the basement floor to the street level and upward to the first and second floors a spacious and well-lighted staircase is provided. Off a mezzanine landing between the ground and first floor the keeper's rooms will be placed, embracing kitchen, scullery, store, and two bedrooms, with a pleasant frontage to Hardshaw-street, and in a position in the building which will be found exceptionally convenient. On the first floor next to Bickerstaffe-street will be provided the physics laboratory, darkroom, and storeroom; the physics lecture-room, with the seating on the amphitheatre plan to accommodate 90 students; preparation-room, and two large classrooms. The wing to Corporation-street on this floor will embrace students' common room, two large classrooms, and the geometrical drawing-room. On this floor will also be placed the cookery and laundry departments, which are so designed that the whole area, 56ft. by 32ft., can be used as one room for large demonstrations. This department will be placed on the rear of the site overlooking the premises previously referred to, and will also be lighted from the large area left within the present block. A teachers' room, lavatory, &c., and the male students' cloakrooms will occupy the irregular piece of land on each side of the main stairs; by this the site, though irregular, is used to its fullest capacity, while all the working-rooms are square or symmetrical in form. A striking feature of this and the second floor landing will be an arcading dividing the same, which may be filled with glazed screens, thus providing a museum for the preservation of prize exhibits or other articles of interest relating to the work carried on in the Institute. The second floor will be entirely devoted to the chemical and art departments, the chemical laboratory (for 60 students—68ft. by 32ft.), balance and combustion rooms, the lecture theatre (to seat 90, the same as the one on the first floor), and preparation-room occupy the whole wing to Bickerstaffe-street. The modelling, painting, and art masters' room and office are placed in the north lighted wing, facing Corporation-street. The elementary art room—56ft. by 32ft.—lighted from both sides, occupies the rear position, the front being reserved for teachers' rooms, ladies' lavatory, &c. Special attention will be given to the heating and ventilation of the building, which will be carried out by a system combining the two. The interior will be lighted by electricity supplied from the Town Hall. The building will be faced externally with red pressed bricks and terracotta. The staircase and corridors will be fireproof, the latter being laid in wood blocks, and both having tile dados on the walls. There will be a lift communicating from the basement to the top floor of the building. The purchase by Colonel Gamble of the adjoining property has made it possible, by obtaining light on all four sides of the site, to provide on four floors the accommodation as at first required. With this exception the plans and elevations remain in all essentials as originally submitted. The contractors are Messrs. Robert Neill and Son of Manchester.

DESIGNING OF STEEL BRIDGES, THEORETICAL AND PRACTICAL.—VII.

HAVING already determined the principal dimensions of the cross-girders to be length from out to out 36ft., depth at centre to outside of flanges 2ft. 6in., width of each flange 1ft. 3in., we may now proceed to calculate the stresses and find the thickness of metal required, and the net sectional area of both the flanges and the web, which will be of steel plate, the same as was used for the main girders. In Article V., in the Building News of July 27th last, the total weight of the combined area of the roadway and footpaths was estimated at 116 tons. As the cross-girders are to be spaced 6ft. apart, they will be ten in number, and their individual share of the live load will be 11·6 tons, to which, if we add three tons for the assumed weight of one girder, we have a total of 14·6 tons. But the cross-girders have also to carry each a share of the weight of the rolled steel joists, the platform of buckled plates, the parapet screen, and the concrete, wood, and asphalte of which the roadway and footpaths are composed. Summing up the values of the separate items, they amount to 4·2 tons for each cross-girder, which raises the total uniformly distributed load to 18·8 tons, or for the purpose of ready calculation to 20 tons. This load, however, does not include the greatest possible load for which engineers and bridge designers have to make provision, which has been previously stated to amount, as a maximum, to the weight of a pair of steam rollers, each of 20 tons, abreast of one another on the bridge, making a total exceptional, or extraordinary, load of 40 tons. The whole of this weight, however, cannot come upon any one separate cross-girder, as only the two leading or single trailing wheels of each roller can rest upon any girder at one and the same time. In steam rollers weighing 20 tons each, the distribution of the load is usually 12 tons on the large leading or front wheels, and the remaining 8 tons on the hinder wheel. It will be perceived that even under these conditions, it is quite possible to have a load of 24 tons concentrated upon each side of the central part of the cross-girder. The effect of this load upon the girder, and the stresses to which it gives rise, will be best understood by the use of a diagram and a few calculations.

In Fig. 9*a*, let A B represent a skeleton elevation of one of our cross-girders drawn to scale, and let C C be a centre line at the half-span. Allowing a distance of 3ft. to be observed between a pair of steam rollers, the position of the larger wheels of each roller carrying 12 tons of the whole weight will be shown by the four thick black lines in the drawing, placed from out to out, 8ft. apart. The load of 12 tons of each of the rollers might be considered to be fairly uniformly distributed over the transverse distance of 8ft. between the wheels; but in order to obtain the maximum effect, we will regard the weight of 12 tons to be acting at a point midway—that is, at the points indicated by the lines *d d* and *e e*, and the problem becomes reduced to determining the stresses at either of the lines *d d* and *e e*, occasioned by the joint action of the two weights there of 12 tons each. It will be sufficient to ascertain them for one of the points, as the calculation for the other will be precisely similar. Let W and W_1 be the two weights situated respectively at *d d* and *e e*, and let the segments into which these lines divide the span of the girder be x y and x_1 and y_1. We shall then have, by the nature of the problem—

$$W = W_1,\ x = x_1, \text{ and } y = y_1.$$

First of all, to ascertain the moment of stress at *d d* resulting from the weight W, which we have assumed to be concentrated at that point. Put M for the moment of stress, and let R equal the reaction of W at the support A, and R_1 that at the support B; then we have generally, making L = the span,—

$$R + R_1 = W.$$

On the principle of the lever, we have—

$$R = \frac{W \times y}{L},\ R_1 = \frac{W \times x}{L};$$

and as the moment of a force is equal to the amount of it multiplied by the perpendicular distance between it and the support, fulcrum, or other point where it is supposed to act, we have in the present instance—

$$M = R \times x = \frac{W \times x \times y}{L}.$$

It is clear that the moment of stress produced at *d d*, by the weight W_1 at *e*, is, as $W_1 = W$, the same as the moment produced at *e e*, by the weight W at *d d*. To find this, therefore, we may use the reaction of W, at the support B, which is equal to R_1. Calling M_1 this other moment, we have by similar reasoning—

$$M_1 = R_1 \times x_1 = \frac{W \times x \times x_1}{L},$$

or since $x = x_1$ we obtain—

$$M_1 = \frac{W \times x^2}{L},$$

and consequently for the total amount of the moment of stress at *d d*, resulting from the joint action of the two weights W and W_1, we find—

$$(M + M_1) = \frac{W}{L}(x \times y + x^2)$$

Substituting in our respective equations the values of the symbols which are W = 12 tons, L = 36ft., and x and y = 12·5 and 23·5ft. respectively, we obtain—

$$M = \frac{12 \times 12{\cdot}5 \times 23{\cdot}5}{36} = 97{\cdot}995 \text{ tons.}$$

Similarly for the value of M_1 we get by equivalent substitution—

$$M_1 = \frac{12 \times 12{\cdot}5 \times 12{\cdot}5}{36} = 52{\cdot}125.$$

Adding the two separate values together, we finally have—

$$(M + M_1) = 150{\cdot}12 \text{ tons.}$$

This value can, of course, be calculated from the equation given above for $(M + M_1)$; but in order to fully explain how the two separate weights affect the same point on the girder, the whole calculation is given *in extenso*, more particularly as this problem, which occurs in examples of bridge designing, has not been treated of before. It should be observed here that the reciprocal action of each weight at the point where the other is situated is due to two causes, which will not obtain under other conditions. One is, that the two weights are equal to one another; and the other, that they are located on each half-span of the girder at equal distances from the centre line C C in Fig. 9*a*. Although we have dealt with the question from a general point of view, which is the most accurate method of treating it, yet when young engineers and students have become first thoroughly acquainted with the correct principle, they will be able to save themselves both time and labour by applying especial equations and formulæ suitable for each individual case. The present instance affords so very favourable an example of our meaning, that a little further consideration of it will be of both interest and value. Instead of taking the action of each weight separately, we may regard both of them as situated at their common centre of gravity, frequently termed in more modern treatises mass centre, which occurs at the middle of the span at CC, taking the reaction at A and B, and multiplying by the leverage x or x_1. It follows, from the position of W and W_1 at equal distances from the centre of the girder, that the moment of stress of both weights at *d d* or *e e* is equal to the moment of stress of the same two weights at the centre, as can be readily shown. In the first instance we found—

FIG. 9a.

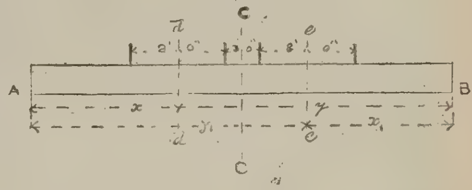

FIG. 9b

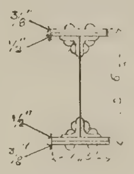

FIG. 10

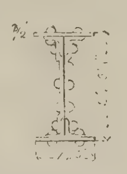

FIG. 10a

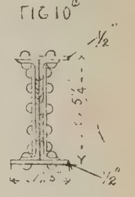

FIG. 10b.

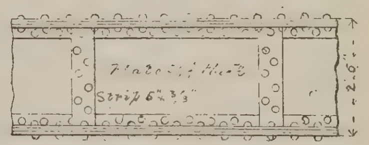

$$(M + M_1) = \frac{W}{L}(x \times y + x^2),$$

and in the second by using the same reactions—

$$(M + M_1) = \frac{2\,W}{L}\left(x \times \frac{L}{2}\right)$$

Substituting in the first of these equations $y = (L - x)$ we obtain by equating—

$$\frac{W}{L}[x \times (L - x) + x^2]$$
$$= \frac{2\,W}{L}\left(x \times \frac{L}{2}\right) = W \times x,$$

which gives 150 tons, the same result already arrived at. If we assume these weights of 12 tons each, or 24 tons altogether, to be uniformly situated over the whole cross-girder, the moment of stress at the centre, by the formula already deduced in previous articles, will be—

$$\frac{24 \times 36}{8} = 108 \text{ tons,}$$

from which it is evident that, so far as the cross-girders of a bridge are concerned, concentrated loads cannot be regarded as equivalent to the same loads uniformly distributed. In order, however, to simplify the calculation for determining the net sectional area required, and have only one total load to deal with, the concentrated load or loads can be converted into equivalent uniformly distributed loads, and then dealt with by the ordinary rules. The case stands thus:—Given the moment of stress produced at the centre of a girder by one or more concentrated loads, find the load uniformly distributed which will produce the same moment of stress at the same point. Let W_2 equal the uniformly distributed load, then we have—

$$(M + M_1) = \frac{W_2 \times L}{8},$$

from which—

$$W_2 = \frac{(M + M_1) \times 8}{L} = \frac{150 \times 8}{36} = 33{\cdot}\dot{3} \text{ tons.}$$

It has been already ascertained that the loads uniformly distributed over each cross-girder amounts to 20 tons, so that adding to this, 33·3 tons, we obtain a total uniformly distributed load of 54 tons.

The actual stress upon the upper and lower flanges of the girders produced by this load will be equal to

$$\frac{54 \times 36}{8 \times 2{\cdot}5} = 97{\cdot}2 = 100 \text{ tons.}$$

In so small an example as the one we are considering it would not be worth while making any difference in the unit stress for the two flanges, as was done in the case of the main girders, and, therefore, they will have on equal net sectional area. It will be advisable to take the lowest unit stress, that is 6, and hence the required net sectional area of each flange of the cross-girders at the centre will be 17in., which practically will be obtained in the following manner. The breadth of the flanges is fixed at 15in., so that it is the thickness of the plates which have to be determined, and also the scantlings of the angle-irons uniting the flanges and web. It is obvious that at the centre two plates will be required, one of which can be "dropped" in the same manner as was employed in designing the main girder. The sectional area will be thus, in which two rivet-holes are deducted from the breadth of the plates and one from each angle-iron—

1 plate (15 − 1·5) $\frac{1}{2}$in. .... = 6 75
1 ditto (15 − 1·5) $\frac{3}{8}$in. .... = 5 06
2 angle-irons 2 ($3\frac{1}{2}$in. + $3\frac{1}{2}$in. − $\frac{3}{4}$in.) $\frac{1}{2}$in. = 5·75

Total net area in square inches........ 17·56

As the maximum stress upon any part of the web does not exceed 27 tons, if we make the thickness of the web-plate the same as that of the main girder—that is, $\frac{5}{16}$in.—the area so obtained will be more than that needed; but the excess is quite unavoidable, as the material cannot be "fined down" any further. The pitch and diameter of the rivets will be the same as those in the main girders, and the general cross-section at the centre is shown in Fig. 9*b*. In Figs. 10 and 10*a* the cross-sections are taken at points where the top plate, $\frac{3}{8}$in. in thickness, has been "dropped." Employing the short formula given in our last article in the Building News of August 10th, we have—

$$r = \sqrt{\left(\frac{L^2}{2} - Z\right)}$$

and inserting the proper values, we obtain r = 7ft., or, allowing 1ft. for overlap, the flange plate, $\frac{3}{8}$in. in thickness, may be dropped at 8ft. from the centre of the girder.

In plate girders of so comparatively small a depth as 2ft. 6in. it is not necessary to use vertical, angle, or tee-irons for covering the joints of the web or for stiffening it. Strips of plate 5in. wide, of the same thickness as the web plate or a little thicker, may be used as sufficient for the purpose. These are usually riveted close up to the web, and bent or cranked over the angle irons (Fig. 10). A neater method is to place vertical packing strips over the central part of the web, cover these and the vertical ribs of the longitudinal angle irons with a pair of outside strips, and rivet them all up flush together, as shown in Fig. 10*a*. The inside packing strips are represented by the hatched lines. It should be mentioned that although the Figs. 9*b*—10*a* are working sections drawn to scale, yet the thickness of the metal has been slightly exaggerated; in fact, it would have been impossible to draw them without some little distortion within the limited size of the cuts at our command. The web plate is shown by a single black line, and the rest of the figures are self-explanatory. There is no necessity for any joints in the flanges, as the plates and angle irons can all be obtained, without extra charge, in one length; but we shall in our next article analyse the joints of the plates in the main girder, and give a drawing of them. The general disposition of the riveting-up of the flange and web plates, and connecting angle irons for the cross-girder, is similar to that shown in Figs. 7 and 8 in our preceding article, and no recapitulation is needed. In Figs. 10*a* and 10*b* the method of arranging the joints in the web plates is rendered perfectly clear. A portion of the elevation of the cross-girder is given in Fig. 10*b*. To avoid confusion, the heads of the rivets on the far side of the flanges which break joint with those in the elevation in Fig. 10*b* are not shown.

◆

New board schools were opened at Briton Ferry last week by the Countess of Jersey. The architect is Mr. H. Francis Clarke, of Briton Ferry.

ST. NICHOLAS' CATHEDRAL, NEWCASTLE-ON-TYNE.

THE Finance Committee of the Newcastle Corporation having requested Mr. Leeson, architect, of that city, to examine the tower and lantern of St. Nicholas' Cathedral, have received an interim report from Messrs. Oliver and Leeson, architects:—

They find that the whole of the tower and lantern above the level of the lead flat is in need of immediate repair. The cement which has been plastered over the stone and ironwork, principally round the octagonal corner pinnacles, has in places become detached, leaving the joints and ironwork exposed to the weather. The moulded stringcourse below the battlements has many of its vertical joints open. In the battlements the beds of the coping-stones have in two or three places been disturbed, and where the iron ties which bind the corners of the tower together cross the battlements, some of the stones have been split by the corrosion of the iron. The small turrets and pinnacles in the centre of each side of the tower are in fair condition. The large turrets and pinnacles at the angles of the tower are, on the contrary, very much in need of repair and pointing. It is round these turrets that the iron ties used to bind the top of the tower together are fixed; the expansion and contraction of these ties, and the corrosion, have caused a good deal of dilapidation. Two of the vanes from the westernmost of the corner spires have been taken down, and some of the remainder are not in satisfactory condition. The iron ties and wood beams which have been fixed across the tower at different times to strengthen it are, especially as far as the latter are concerned, much decayed. The arches springing from the turrets and carrying the lantern appear to be in very fair condition. One of the small flying buttresses which spring from these arches to the turrets at the corners of the tower is in a defective state. It has been coated with cement and has an iron tie built in. As in other cases, the corrosion of the ironwork has thrown the cement off. In the lantern itself the most serious dilapidation is apparent. The iron saddle-bars, which have been used to tie in the mullions, have, by their corrosion, burst the mullions in two or three places. The splitting away of the stone has left the upper portion of the mullion and the tracery above in an insecure condition, and steps should be immediately taken to restore the damaged portions of the work. The whole of the lantern requires pointing and thoroughly overhauling, especially where ironwork has been built into the stone. We have not (Messrs. Oliver and Leeson add) been able to reach the upper part of the lantern and spire, but will do so when further ladders and scaffolding are erected, and will then report as to the condition of this portion of the building. The cause of a considerable amount of the present dilapidation is without doubt the expansion and contraction and the corrosion of the ironwork, which has been freely used to tie the structure together. This should have been periodically inspected, and kept in good repair. In the present condition of the lantern the ringing of the bells should be avoided, as anything in the nature of vibration must have a detrimental effect on the structure.

The following repairs should, they consider, be commenced forthwith:—The vertical joints of the string below the battlements should be carefully grouted and repointed in cement. The coping stones of the battlements where disturbed should be taken off, copper dowels inserted, and the stone reset. All stones that have been split or injured by the corrosion of the iron ties should be taken out and replaced by new ones. The small turrets and pinnacles should be pointed, and the large turrets and pinnacles should have the cement, which is peeling off, removed, and all the beds and joints grouted and pointed in cement. The two damaged vanes should be restored, and all other vanes carefully examined and put into proper condition. This would probably involve the taking down and resetting of some of the stonework. All the ironwork used in the structure should be thoroughly cleaned, and coated with the best anti-corrosive liquid. The small flying buttress between the main arch and the corner tower should be taken out and new stones put in, as has been done in the other three cases. We would advise that the whole of the mullions and transoms in the lantern be taken out, and the iron saddle-bars and straps removed; that the stonework be reused as far as possible, new stones being used to replace the damaged ones, and all the saddle-bars and ties be replaced by copper. The leads on the top of the tower also require certain repairs. We would suggest that your committee should authorise us to arrange for Mr. Walter Scott to commence the work forthwith on a schedule of prices being agreed to.

EXCAVATION OF THE ARGIVE HERÆON.

AN interesting account of the excavation of the ancient Temple of Hera, about half a dozen miles from Argos, is given by the *Times* special correspondent in Greece. The excavations have been carried out by members of the American School of Archæology, under the superintendence of Dr. Waldstein, of Cambridge, assisted by Messrs. Washington, Norton, Hoppin, and Aldin, of the same school, as well as by Dr. Richardson, the director of the school, and were commenced in February, 1892. The workmen, who number some 250, are for the most part peasants from the neighbouring villages. The explorations on the site of the older temple, destroyed by an accidental fire in 423 B.C., have revealed large polygonal slabs, forming a pavement some 145ft. in length, by 113ft. in breadth; this covered a considerable portion of the terrace supported by the Cyclopean retaining-wall. No traces of foundations have been discovered such as might enable us to reconstruct the design of the building. Dr. Dörpfeld believes that the columns on the southern side of the peristyle rested directly on the Cyclopean wall. The only vestige of the temple which remains is a portion of the substructure of the cella. The objects found beneath this line of walling must therefore antedate the erection of the temple, and include numerous fragments of pottery, heavy, thick, and unpainted, and evidently belonging to the Primitive period of the ceramic art, together with bronzes, rudely-engraved stones, glass and bone heads, and a bronze goat. Many of the metal objects found had been melted by fire, and these, as well as a layer of black earth with pieces of charred wood and stones split by heat, afforded material confirmation of the burning of the temple.

The excavation of the second temple—supposed to have been built under the direction of the sculptor Polyclitos, by whom was fashioned the famous chryselephantine statue of Hera which stood in the temple—however, and of the surrounding precincts, was the most important portion of the work. The clearance of the site has revealed the substructure of the temple, which has been preserved throughout its entire circuit, and the general plan and outline of the building are displayed at a glance. The entire superstructure was demolished and plundered in the Middle Ages, and not a single stone of the stylobate remains. This second temple was a Doric peripteral hexastyle, with 12 columns on the flanks, and with a stereobate measuring 130ft. by 64ft.—a ratio of length to width somewhat less than in the Parthenon. The columns and entablature were of porous stone, but the triglyphs and the pediments were of black marble. The sculptures in the metopes and pediments were of Parian marble, and we know from Pausanias that the subjects which they represented were the birth of Zeus, the Gigantomachia, the expedition against Troy, and the capture of that city. The internal structure had the form of a double temple *in antis*, and the cella was adorned with two ranges of interior columns. Among the buildings which surround the later temple, the clearance of which has formed the principal task of this year's operations, are traces of dwelling-houses for the priestesses of the earlier temple, a long stoa with a range of at least 19 pillars, behind which are the bases of statues, a second stoa, an aqueduct in the mountain side, and two tombs, similar, but anterior in date, to those at Mycenæ. The excavations have yielded a harvest of works of primitive art, which almost equals in importance the discoveries of Schliemann at Tiryns, Mycenæ, and Troy. Terracotta idols, plaques, and images of animals, bronze statuettes, rings and pins, beads, scarabs, and seals of amber, glass, or porcelain, have been found in hundreds. There are numerous specimens of pottery and terracotta figurines. Important discoveries were also made of fragments of sculpture of the best period of Greek art.

◆

A vestry which has been added to Filey parish church, from designs by Mr. Robson, of that village, was dedicated on Friday by the Bishop of Hull.

"PASSMORE EDWARDS" COTTAGE HOSPITAL AT WOOD GREEN.—CHURCH EMBROIDERY.—THE GAMBLE INSTITUTE, ST. HELEN'S.—ALL SAINTS CHURCH, RINGWAY.—SOUTHWOLD CHURCH.—THE CLAREMONT PRIVATE HOTEL, HARROGATE.—AN AMERICAN BEDCHAMBER.

Our Illustrations.

THE WOOD GREEN COTTAGE HOSPITAL.

The foundation-stone of the new Wood Green Cottage Hospital was laid on Saturday last in Bounds Green-road, Wood Green, by the donor, Mr. J. Passmore Edwards. Many of the local inhabitants were present, including Col. Durrant, H.A.C., Messrs. Bradshaw, Ridgway, Pleming, H. Bond Holding, Mr. and Mrs. Washington Wilks, and others, and the bands and banners of the friendly societies enlivened the proceedings. The idea of a cottage hospital at Wood Green originated some time back with an influential committee, and it was intended, funds not being plentiful, to commence in a private house. Col. Durrant, however, was able to announce to the committee that a friend had offered to defray the whole cost of a fully-appointed cottage hospital, amounting to £2,000, and that friend turned out to be Mr. J. Passmore Edwards. The course being thus clear, Mr. Chas. Bell, F.R.I.B.A., was commissioned to prepare designs, and the result is a model cottage hospital in every respect. The hospital will be erected on a freehold site of half an acre, acquired for £300 from the Ecclesiastical Commissioners. It will contain two wards, each with four beds, for men and women, two isolation wards with one bed in each, separate operating room, nurses' bedrooms, entrance hall, nurses' rooms, kitchen, laundry, &c. The materials are stock brick, with tile hangings and rough cast facing to the upper part of the central portion. The architect has certainly produced a building in every respect suitable for its purpose at a marvellously low cost. The builder is Mr. Charles Wall, of Chelsea. At the ceremony on Saturday, Mr. W. F. Bradshaw, one of the trustees, briefly stated the objects of the hospital, and introduced Mr. Passmore Edwards, comparing him to the Good Samaritan, on account of the help he had bestowed on the sick and needy. The trowel and mallet having been handed to Mr. J. Passmore Edwards by Mr. Charles Bell, the architect, the stone was duly laid amid cheers. Prayer having been offered by the Rev. T. C. Eldon, the rector of St. Gabriel's, Wood Green, the Old Hundredth was sung. Col. Durrant then proposed a vote of thanks to Mr. J. Passmore Edwards for his presence there that day, and also for that of Mrs. Passmore Edwards. It was no mere formal vote, but with a feeling of deep gratitude, that he acknowledged the princely assistance that had enabled them to carry on the work as far as it had gone. The site was a good one, and the circumstances, so far, were auspicious. As long as all present lived all would remember Mr. Passmore Edwards. In response to the vote of thanks, which was seconded by Mr. Pleming, as the representative of the Trade Societies, Mr. Passmore Edwards said he was pleased to meet all there that day, but there was a trifling misunderstanding current. People thought he had nothing but sovereigns to fling about the world. That was a mistake. He put his pence together and his shillings, and when he had a thousand pounds to bestow he was glad to do it. The origin of his connection with the Wood Green Hospital was that, when he gave a cottage hospital to Willesden, the wish was expressed to Col. Durrant that someone would do the same for Wood Green. Col. Durrant soon wrote to him, but he thought at first that the well-to-do people of Wood Green might build one for themselves. But it was represented to him that large numbers of working men lived in the district, and it was for them he had given the hospital. Mr. Edwards hoped that Wood Green would differ from Willesden in one respect. The hospital at Willesden had been full from the opening. He hoped that at Wood Green would remain empty, and if anyone asked what good such a hospital was doing he would say, as an old friend of his used to observe who always carried a sovereign in his waistcoat pocket, it was there when they wanted it. In conclusion, Mr. Edwards said it afforded him pleasure to know that he had never seen a better-planned or more picturesque hospital than that designed by Mr. Chas. Bell, and he hoped the opening in April or May next would afford them another opportunity of meeting. Votes of thanks to Mr. Bradshaw, proposed by the treasurer, Mr. E. B. Ridgway, concluded the proceedings. Later in the evening many of the visitors adjourned to the Noel Park Football Ground, where an attractive series of sports had been organised by the United Building Trades Societies of the district, the proceeds of which are to go towards the purchase of the land on which the hospital is being built. At the conclusion of the sports Mrs. Passmore Edwards distributed the prizes to the victors, a hearty vote of thanks being tendered to her, and suitably acknowledged on her behalf by her son, Mr. H. P. Edwards, B.A.

CHURCH EMBROIDERY.—XIII.

May Morris's concluding article on this subject will be found on p. 277 *ante*.

GAMBLE INSTITUTE, ST. HELEN'S, LANCS.

(See description on p. 282.)

RINGWAY CHURCH.

This church, now in course of erection, replaces a structure of the Georgian period, and consists of nave, north aisle, chancel, transept, and vestry. The nave is divided from the aisle by oak octagonal columns, from which arched braces spring to support a longitudinal beam carrying the roof timbers. The walls are built of local bricks, and all architectural features therein are of Northwich terracotta. The west gable, porch, and spirelet are of oak. The roofs are all open-timbered, boarded on the top, felted, and covered with Ruabon brindled tiles. The floors generally are of pitch-pine wood blocks, the passages being tiled with plain tiles having encaustic borders; the sacrarium is laid with oak parquetry, and the walls are lined with panelling of fumigated oak. The church accommodates 200 persons, and the cost is being entirely defrayed by the Right Hon. Lord Egerton of Tatton. The oak-work also is constructed with timber grown upon his lordship's estates. The architects are Messrs. Preston and Vaughan, of Diocesan Chambers, Manchester, from whose designs and under whose superintendence the work is being carried out.

SOUTHWOLD CHURCH, SUFFOLK.

The church of St. Edmund the Martyr, at Southwold, is a fine and typical example of one of the most interesting phases of English architecture, the Perpendicular work of East Anglia. In common with many churches of the district, it is of a size quite out of proportion to the present population of the parish, except during the season, when the building is fully filled, thus bearing evidence of the piety and prosperity of a bygone age. The church is said, on good authority, to have been begun and finished between 1399 and 1413, though there is evidence among the documents relating to bequests for the fabric that the final completion was some 50 years later. The screen, a fine piece of woodwork, with richly-painted panels, is one of the principal objects of interest in the building; and the roof, with its angel-headed hammer-beams, sustains the special reputation of Norfolk and Suffolk for this particular feature. The interior of the church generally is remarkable for a certain grand simplicity, and for the absence of projecting members. Nearly all the mouldings are cut back from the wall face, no labels or bosses being used in the pier arches. There is a chamber above the porch, which at one time was used as an armoury, and there is much special interest to be found in the flint work, and especially in the devices worked into the panels of the external plinth. Conspicuous among them is an ingenious monogram, which contains in a simple cipher all the letters of the Virgin's name. The late Mr. G. E. Street, and more recently Mr. Arthur Street, have been concerned in the restoration of the building, which has been carried out with the greatest care and respect for the ancient features of the church. The rood staircase is in good preservation, and at the head of the stairs stands a weird wooden effigy in armour, whose present function is to announce the entrance of the clergy by striking with a battle-axe on a small bell. The above notes and the accompanying sketches have been contributed by Mr. Paul Waterhouse, M.A., to whom our thanks are due.

CLAREMONT PRIVATE HOTEL, HARROGATE.

No description of this building has reached us in response to our usual invitation.

AN AMERICAN BED-CHAMBER.

The bedstead, the chief object in the bedroom, is here one of the old four-poster type, and the illustration needs no further description.

CHIPS.

A Primitive Methodist chapel is about to be erected in Ford-street, Coventry, in replacement of one built in Grove-street in the same city in 1837. The new church will cost £2,000, and will be constructed from plans by Mr. John Wills, F.S.A., of Derby.

The foundation stones of new United Methodist Free Church chapel and school premises were laid on Wednesday in York-road, West Hartlepool. The estimated cost of the new buildings is £4,250.

An unusual number of architects and builders were candidates for Parliamentary honours in the recent electoral contest in New South Wales. Among those returned is Mr. Varney Parkes, a well-known Sydney architect, son of the veteran statesman, Sir Henry Parkes. On the other hand, Mr. U. W. Carpenter, the President of the Builders and Contractors' Association of New South Wales, was defeated.

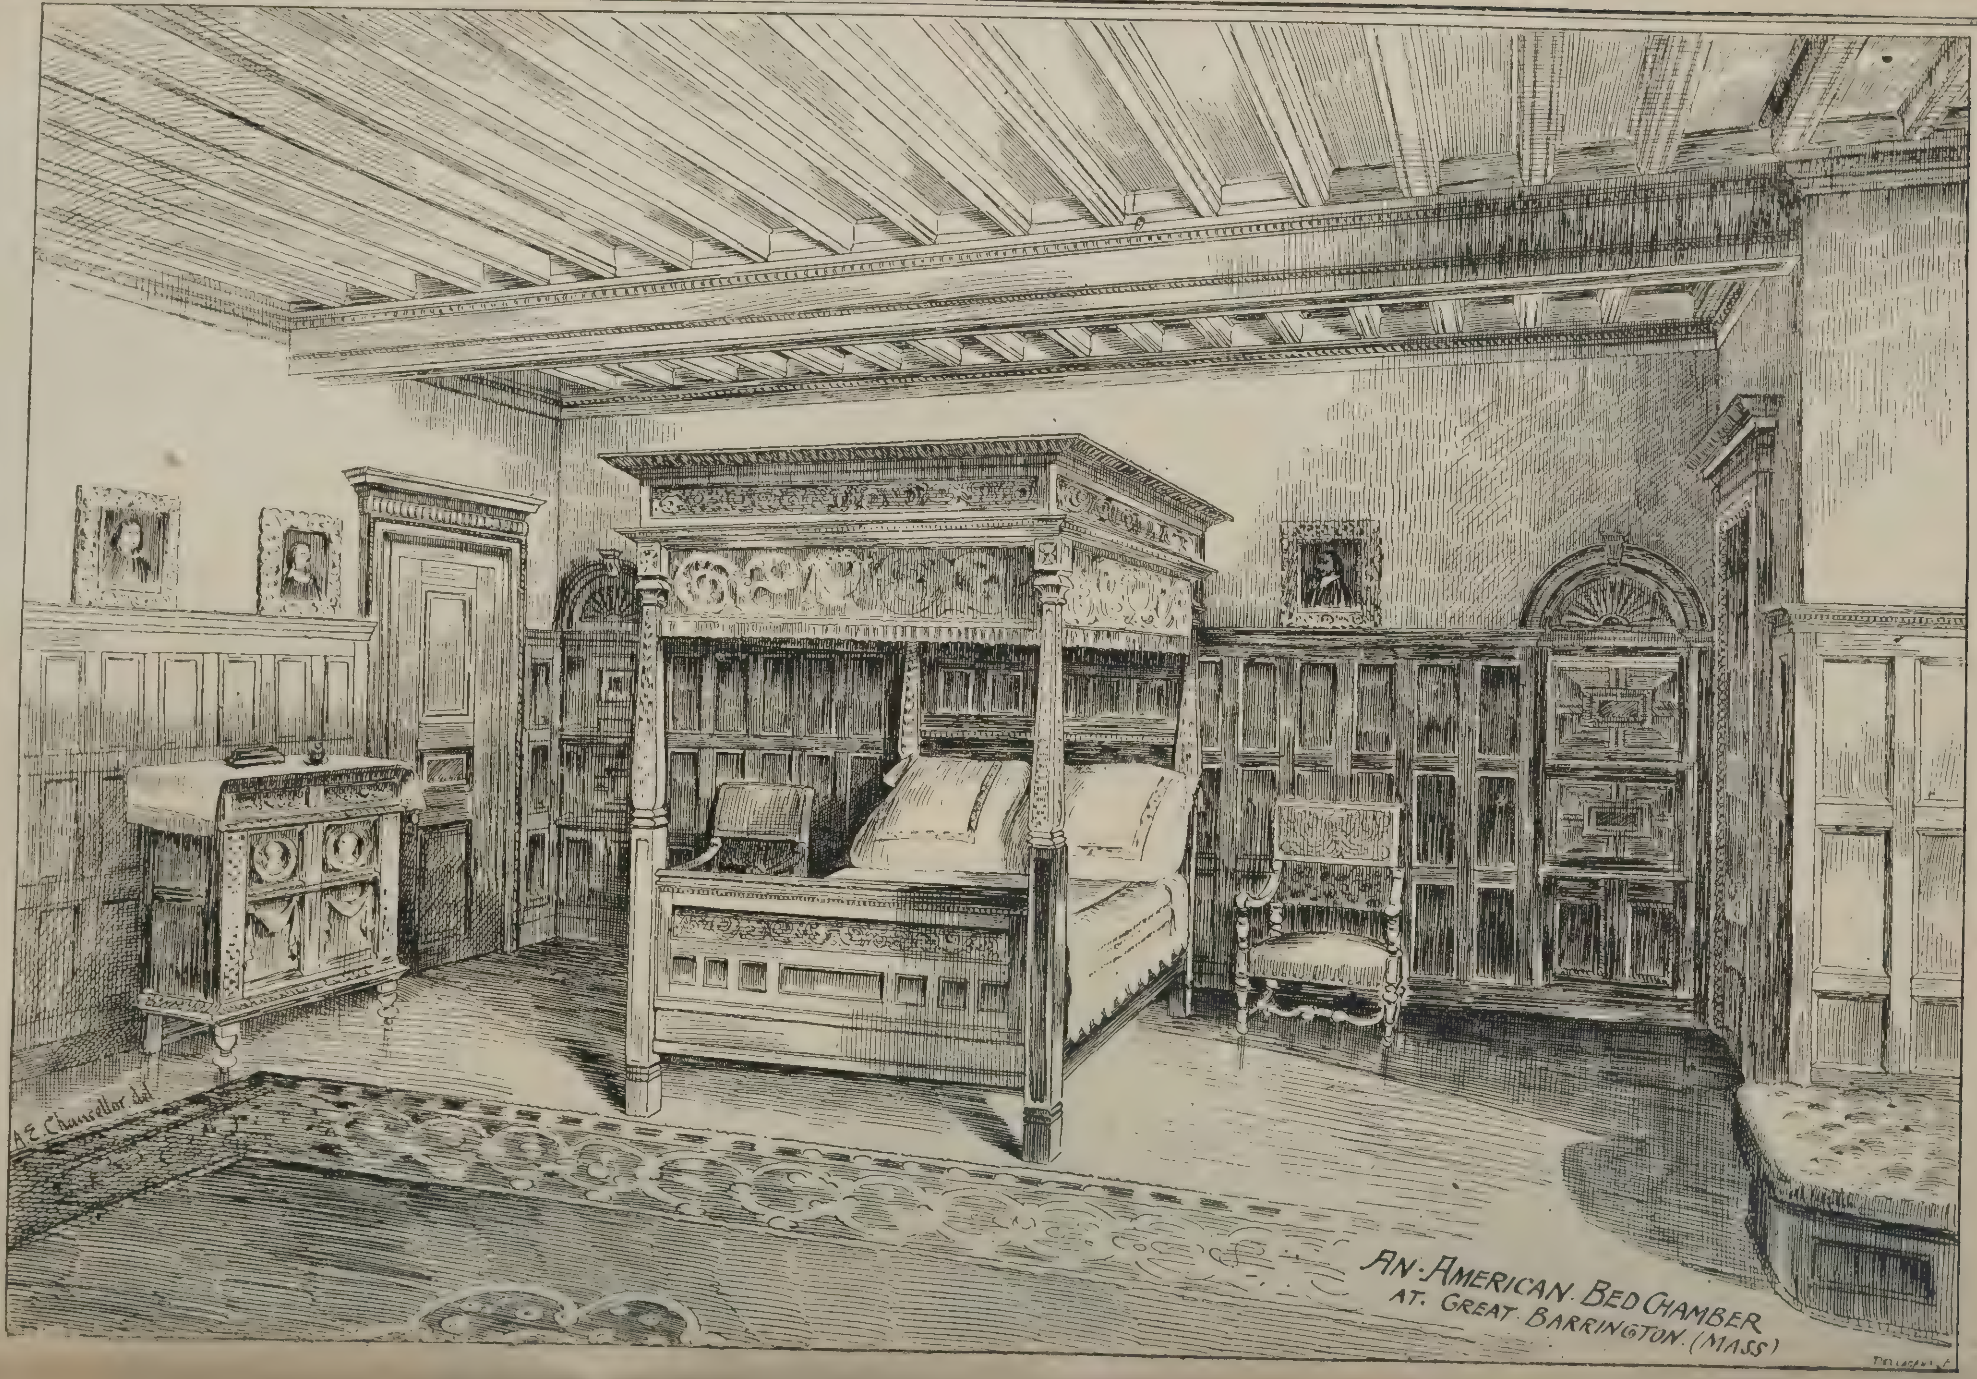
For the vacant office of clerk in the city surveyor's office at Winchester, salary 30s. a week, and duties to keep the books of the surveyor's office, help the surveyor to take levels, and draw plans, &c.; hours of work from 9 to 6 in an ordinary way, and, if necessary, to work overtime, no fewer than 163 men presented themselves as candidates, although it will be seen that the hours and wages are scarcely equal to those of a journeyman bricklayer.

A memorial in the shape of a Latin cross, 8ft. high and 3ft. broad, of roughly-hewn red Aberdeen granite, with a base and kerbing of the same material, has just been erected over the grave of Mr. Edward Askew Sothern, in Southampton cemetery. The old stone cross previously there has been removed to the eastern end of the grave. The inscription reads:—"Edward Askew Sothern, comedian, born April 1, 1826; died January 20, 1881."

Henry Barker, building material dealer, of Skelton-lane, Leyton, was committed for trial on Saturday, on a charge of removing and concealing large quantities of his goods within four months of his adjudication as a bankrupt, with intent to defraud his creditors. The prisoner was adjudicated on June 11, and his statement showed debts amounting to £1,160, with assets about £80, and £56 book debts.

Reopening services were held in Paulton Wesleyan Chapel, Bristol, on Sunday, after enlargement and re-seating, and a new façade. The latter is of Bath stone and of white lias stone. The architect is Mr. W. F. Bird, of Midsomer Norton, and the contractor Mr. Gait, Ston Easton. The chapel will now seat 510 people. There are two new vestries. A new organ chamber has been built, allowing a lengthening of the gallery.

Sir Tatton Sykes is opening a tumulus near Wold Newton, a village five miles south of Hummanby Station, under the superintendence of Mr. J. R. Mortimer. The barrow is a very large one, and in the same valley as the Duggleby Howe, and stands a little to the south of Wold Newton. The mound consists of valley gravels, largely mixed with peat. Portions of human remains have been found, and two perfect skeletons, with the heads slightly crushed, one a man 5ft. 10in., the other an elderly female. A few flint arrows and chipped foreign flints have been found, but no pottery.



A.E. Chancellor del.

THE CLAREMONT PRIVATE HOTEL, HARROGATE.

Additions by T. Butler Wilson, F.R.I.B.A. Archt.

Building Intelligence.

Birmingham.—The foundation-stone of the new General Hospital will be laid by the Duke of York on Saturday in next week, Sept. 8th. The building will be erected from plans by Mr. William Henman, F.R.I.B.A., of Birmingham, selected in open competition, and will occupy a parallelogram between St. Mary's-square and Steelhouse-lane, with side fronts to Loveday and Whittall-streets. The architect has chosen Steelhouse-lane as his principal front, and has disposed his blocks of pavilions in the form of wings projecting at right angles from a corridor building of three stories. The plan is an Ш, the outer of these three wings coming forward almost to the street, while the central one, or administrative block, projects rather less than half-way, so leaving a quadrangle within the entrance gates. A low covered way with an open arcade connects the centre wing with the two side ones. The central or administrative block is carried backwards nearly to St. Mary's-square. The right-hand wing is devoted upon the ground floor to out-patient work, and is flanked by single-story buildings for consulting rooms, its two upper stories being appropriated as male medical wards. The left-hand wing has board and committee rooms on the ground floor, and upon the two upper floors are female medical wards. The two main longitudinal blocks each give long surgical wards in three stories to each block. Two smaller wings to either side of the central corridor provide special wards, including one for children. A one-storied covered way will afford communication with a nurses' home of three stories and basement fronting Whittall-street. Upon the Loveday-street façade will be a semicircular projection; this will give an operating theatre on the basement and first floor, and a lecture theatre corresponding to the two floors above. Externally the treatment will be of red brick and terracotta, Gothic in character. The skyline will be broken by various turrets and by two large water-towers. The site has cost £48,000; the architect's commission will be £7,500; Messrs. Barnsley and Sons' first contract, for preparing the foundations, was £5,000; their second contract, for the actual building, is for £117,888; furniture will cost £10,000; machinery, £3,000; miscellaneous, £2,500; making altogether £206,000. Exclusive of land and fittings, but including nurses' home, it will cost for 341 beds £360 per bed.

Brecon.—The reparation of the grand old tower at St. Mary's, Brecon, which stands in the centre of the town, is now being carried out under the direction of Mr. F. R. Kempson, F.R.I.B.A. The utmost care is being taken to preserve old work. Nothing is being replaced except what has been demolished by time or which is found to be either totally decayed or dangerous. All the framing for the bells will be new, as well as the floors. Stone has been selected which harmonises with the old work. Cement is being used throughout, instead of lime, and the utmost care has been taken to make the fabric thoroughly substantial. The commencement of the work was delayed for unavoidable reasons, but every effort is being made to complete the more important parts of the work before the coming winter.

Bristol Cathedral.—The work of restoring the tower having been completed under the direction of Mr. J. L. Pearson, R.A., the architect to the Dean and Chapter, the two bays of the cloisters are about to be begun. The internal restoration is also being proceeded with by Messrs. W. Cowlin and Sons, the contractors. Already the organ has been removed from the west end and stowed away until it can be rebuilt. Search has been made for evidence of the exact position of the old screen, and an ancient foundation extending across the choir from north to south was discovered. This is supposed to indicate the position of the original reredos. Light has also been thrown upon the position of the original screens, and the contractors are engaged in examining and putting together the old stones at present in the churchyard, which it has been ascertained originally formed part of the screens in the choir. Where possible the old material will be used again. The ceiling of the choir has been cleaned, the groin cells have been distempered, the old colour-wash has been removed from the ribs of the ceiling, and the stonework cleaned and restored. The floor of the choir has been taken up, and preparations are being made for laying the new marble floor.

Edinburgh.—The foundation-stone of St. James's Parish new church, in Carson-street, Leith-walk, was laid recently. It occupies a fresh site, and will be seated for 1,000 persons. From the nature of the ground it has been found necessary to make a basement story, which has been utilised for a hall and retiring-rooms. The hall is seated for 700 people, and can be divided by a partition. The church is in Lancet Gothic, with more of decorative detail in the chief front. The galleries at the side will be lit from gabled dormers, and the east end relieved by a lofty apse and vestry, &c. The stone is coursed in Hailes rock, with red stone dressings. The estimates provide for an expenditure of £4,000; but to finish the spire, which is to be built at present only to the eaves of the church, and provide better appointments and finishings, would require about £1,000 more. Messrs. Hardy and Wight, Edinburgh, are the architects.

Felixstowe.—The foundation of a district church was laid on Friday in Tower-road, on what was till lately a portion of the Wadgate Farm, by the Hon. Mrs. Pretyman, wife of the lord of the manor. The architects are Sir Arthur W. Blomfield, A.R.A., and Sons, and the contractors are Messrs. J. Dorey and Co., of Brentford, the amount of the contract being £4,390. The building will consist of a nave 80ft. in length, and north and south aisles, with south and west porches, and a tower at the west end, ultimately to be surmounted by a spire, and 688 seatings will be provided. The building will be Early English in style, and will be constructed of red brick, locally made, with Bath-stone dressings. Light is to be provided by a series of clerestory quatrefoil windows, small and numerous, of a type frequently seen in East Anglian churches, and filled with cathedral glass. The roof will be open-timbered, the nave covered with Broseley tiles, and the aisles with lead. The floor will be of pitch-pine, and for the present chairs will be used. The entire building, when completed, will have cost between £7,000 and £8,000. The portion which will remain to be built consists of organ chamber, vestry, chancel, and chancel aisle. The church is to be opened in April next. Mr. Buxton is clerk of works, and Mr. Thos. Strong foreman.

Kirkstall Abbey.—The work of preserving the Cistercian abbey ruins at Kirkstall is, says the *Leeds Mercury*, progressing but slowly. Three years have elapsed since the masons first commenced their labours, and for another twelve months, at least, they will be busily engaged. The expenditure by the Leeds Corporation upon the abbey and grounds amount already to about £5,500. The repairing of the vaulting of the chancel and the strengthening of the tower are now engaging the attention of Mr. J. T. Micklethwaite, F.S.A., of Westminster, the architect. In 1779 the north-west pier and the north and west arches were utterly destroyed by the fall of two sides of the tower. What is left of the tower had, up to recently, nothing to support it on the north side, and an unusually violent gale might at any time have brought it down. Even now the masonry of the upper part of the tower is in a very crumbling and unstable condition. The chancel is at present filled with a network of scaffolding poles. The greatest care has to be exercised in fixing this scaffolding, the slightest touch in certain parts of the ruins being sufficient to detach large pieces of masonry. The western portion of the church has already been rendered secure. In an especially good state of preservation is the west entrance, where very little new work has been required. With the north transept, on the other hand, it has been found necessary to rebuild a considerable portion. After the preservation of the abbey itself has been completed, the architect will deal with the cloisters, which are now in a very unsatisfactory condition. Traces of the destructive effects of ivy roots are everywhere evident. The grounds around the abbey are not as picturesque as they might be, though there has been a slight improvement during the past twelve months. Walks have been laid out, a bandstand erected within 20ft. of the ruins, an embankment built along the riverside and planted with willows, and a portion of the ground banked off, to be eventually flooded and made into a lake. There has been no attempt, however, as yet at laying any part of the ground out in garden plots, or anything of that kind. Mr. Irvine is the clerk of works.

Manchester.—New Inland Revenue offices are being built for Manchester at the corner of Hardman-street and Deansgate. In the basement will be rooms for four supervisors and their officers, a stamping-room, connected with stamp office on ground-floor by a lift; strong-room, stores, cellars, and lavatories. On the ground-floor to the right of the entrance, at the corner, will be the public office for the Excise, and collector's private office, with retiring-rooms and stores. To the left will be the public office for the sale of stamps, &c., and rooms for the controller and for probate business. There will be a private entrance at the back for the clerks and caretaker. A central staircase opposite the entrance will lead up to the first and second floors. On the first-floor offices will be provided for the surveyors of taxes and their clerks, waiting-room, stores, lavatories, &c. On the second floor will be rooms for the caretaker and spare rooms. The building will be faced with stone from the Warwick quarries, near Hudddersfield. The plinth, architrave, and columns to the main entrance, also columns to the windows, will be polished grey Aberdeen granite. The floors will be of concrete, with wood block, tile, and stone paving. The public offices and corridors will be probably lighted throughout by electricity. The architect is Mr. Henry Tanner, Her Majesty's Office of Works, London; the builders are Messrs. Robert Neill and Sons, of Manchester; and the clerk of works is Mr. Searchfield.

CHIPS.

The 80th birthday of Professor Ernst Curtius, the celebrated Greek scholar, the 11th September, will be observed at the Museum of Olympia by the inauguration, in presence of many distinguished persons, of a marble bust, in commemoration of the services rendered by the German *savant* to Greek history and archæology, especially in initiating and inducing the German Government to undertake the excavations at Olympia.

The thirty-fifth congress of members of the Association of German Engineers was opened in Berlin on Monday morning.

The Edinburgh town council have just carried out an important street improvement by widening Salisbury-place, a thoroughfare traversed by the tramway, from 29ft. to 42ft., at a net cost of £4,000.

The Earl of Carlisle and Mr. T. D. L. Devitt having been authorised by the New South Wales Government to purchase pictures for the Sydney National Gallery, have secured several paintings by well-known artists. They are "Virginia di Monte San Giorgio, Perugia," by Professor Giovanni Costa; "Shorthanded," by Lionel Smythe; "The Bedouin's Home," by F. Goodall, R.A.; "Fleet Street," by Herbert Marshall; and "Gringoire," by E. R. Hughes. The two first named are in oils, and the remaining three in water colours. The pictures will be forwarded to Sydney on September 8.

Mr. Batsford will publish early in September a new edition of Meyer's "Handbook of Ornament," the first issue of which was exhausted in three months. The new edition has been carefully revised by Mr. Hugh Stannus, F.R.I.B.A., lecturer on applied art at South Kensington, and contains about 3,000 illustrations of the elements, and the application of decoration to objects.

Mr. R. Pering Bowden, surveyor, R.E. Civil Staff, has just retired after a service of 40 years, having been stationed during this period at Woolwich, Gosport, Gibraltar, Edinburgh, Inverness, and other places.

The Pearns Convalescent Home, near Plymouth, is being warmed and ventilated throughout by means of Shorland's patent Manchester stoves with descending smoke flues, and by means of Shorland's patent Manchester grates, the same being supplied by Messrs. E. H. Shorland and Brother, of Manchester.

The Roman Catholic Cathedral of St. Barnabas, Nottingham, was reopened on Sunday last, the 26th inst., after interior restoration and decoration, the style of the work corresponding with that of the cathedral fabric—viz., Early English throughout, from designs by Mr. Thos. F. Norman, ecclesiastical decorator and artist in stained glass, St. Nicholas Church-street, Warwick.

The foundation of the new School of Science and Art for Bromsgrove was laid on Tuesday. The site is in New-road, adjoining the Institute, and the design harmonises in character with that building. On the ground floor there will be a lecture theatre, laboratory, and science classrooms, and on the floor above will be the art classrooms. Mr. John Cotton, of Birmingham, is the architect, and the contract for building has been taken at £1,515 by Mr. Brazier, of Worcester-street, Bromsgrove.

WAYSIDE NOTES.

I MENTIONED last week the approaching demolition of Sir Edwin Landseer's house in St. John's Wood. A building with kindred associations is about to share the same fate in Paris. Meissonier's house, built on his own designs, in the Place Malesherbes, in front of Gustave Doré's monument of Alexandre Dumas, is to be pulled down in order to make way for a six-story building, and the work of demolition is already begun. Meissonier's house was somewhat in the style of the Renaissance. It was unlike any modern house, and was neither eccentric nor conspicuous. It looked the abode of an artist, and a wealthy man, but not assertively so. Its windows towards the street, scarcely more than loopholes, suggested inner windows opening on a court which, judging from the exterior, must be a Renaissance cortile. This gave an impression of indifference, perhaps slightly contemptuous, of the outer world, and of a comfortable seclusion not so much of the hermit as of the satisfied bourgeois. Meissonier hoped that his house would become a museum. He wrote: "My hotel was built for a museum. This is apparent to any visitor. My descendants might live there as tenants and curators." Another time he wrote: "I hope that the treasures of art in my studio will never be sold. I hope that my son will give them to the State. I believe this is his wish, as well as my own. I am sure that he will feel too much love and respect for his father's work ever to disperse it. I trust he will turn this house into a little museum." The hope, however, was not to be fulfilled.

I am much of opinion with a correspondent of the *Morning Post*, that the traffic of the streets could be much better regulated if suitable tracks were laid down with proper smooth slabs of suitable width and gauge for the wheels of vehicles, the space between for the horses' feet being paved so as to give good foothold, and where the width of the streets would admit there might be four such tracks, two for slow and two for quick traffic. Such tracks could be laid so that vehicles might pass off and on freely, even at the crossing of the streets. The system is the old Roman road, such as may be seen in several parts of this country, especially in Chester, and as at present existing still in Rome, Milan, &c. The first cost would not be more than the present system, and the expense of repairs would be very trifling, as once well laid they would be most durable, and the present objectionable tramroads, with flanged wheels, could then be entirely dispensed with—as every road would be a tramroad, and every vehicle a tramcar. It would also be suitable for country roads, instead of expensive iron tramways, such as have been lately so much discussed by County Councils.

The bursting of the Gohna Lake has been awaited for weeks, and even months, with no little anxiety. The history of the disaster is of interest to the civil engineer. About eleven months ago a little stream running into a tributary of the Ganges was blocked near the village of Gohna by a succession of landslips. The summit of a hill rising 4,000ft. above the river's bank fell across the water-way, forming an immense rampart some 800ft. high. At length the gorge was found to be dammed by a mass of rock and clay. When the spot was examined it was seen that in course of time, as the snows melted, the waters pent up in the valley would gradually rise to within a few feet of the top of the dam, and would then find a way over and through. The difficulty was to foretell precisely how and when the end would come. The water might percolate through the lower sections of the dam, which was about a couple of thousand feet long, across at its top; or it might find no outlet till it reached the valley-shaped depression midway between the hills on either side. Inch by inch, foot by foot, the waters rose; but the authorities had not been idle. The plan of drawing off the surplus water by an artificial channel had been abandoned, because the operation would have cost a prohibitive sum, and also because, owing to the difficulty of procuring labour, it might never have been completed in time. But a special line of telegraph was constructed, so that the villagers living in the probable track of the flood could be warned at the first sign of danger, and the rise was narrowly watched. These precautions, so far as the protection of life is concerned, have proved sufficient. The destruction of property that has actually taken place will most likely turn out to have been inevitable.

I see the old controversy about the necessity of reviving the canal system is being resuscitated in the dailies. It is well pointed out by Mr. Henry Taylor, in the *Times*, in connection with this matter, that there is an aspect of this question which engineers leave out of consideration—the influence of canals and canalised rivers on the climate of districts permeated by them. They seem to forget that rivers are our best main drains, and that one effect of maintaining their waters at a uniformly high level by means of locks is to prevent natural drainage of the land contiguous to them, and, in some instances, to keep hundreds of acres waterlogged for a great part of the year, and so quite unfit for cultivation. This saturation of the soil produces abundant exhalations, which become visible after sunset as a more or less dense mist along the course of the canal, making the air cold and unwholesome for those who reside in its neighbourhood. In the opinion of many such deterioration of the climate by canals more than outweighs any commercial advantages that may accrue from them. India has taught us this lesson on a grand scale. For many years after the completion of the Ganges Canal large tracts of land on either side of it were converted into swamps, which became the hot-beds of malarial fever and the graves of many engineers engaged on the works. To obviate these disastrous results, the Indian Government wisely ordered a system of land drainage parallel to the canal, which now carries off the surplus water, and has restored the land to cultivation. The moral of all this is that if we are to have an improved and extended canal system we must be prepared with a scheme of land drainage side by side with the canals; otherwise, we had better be content to leave the question of railway rates to be solved by the next generation.

The latest stage of the great domestic bath question is discouraging. The magistrate at the South-Western Police-court on Monday gave his matured decision on the summons issued by a householder against the Lambeth Water Company. The householder refused to pay the extra charge for his bath on the reasonable ground that the charge for domestic supply included every use of water on the premises. The company accordingly cut off the whole supply. The magistrate held that they were justified in doing so, and dismissed the summons against them, with heavy costs. It is impossible that this matter can remain where it is. The London Water Companies cannot be permitted to discourage cleanliness and promote disease merely that they may still more largely increase their bloated dividends. The municipalisation of the water supply of London is the most vital need of the Metropolis, and the one consolation in connection with the high-handed conduct of the water monopolists is that their system of blackmail will hasten it.

Surely the opportunity offered for completing Somerset House ought not to be missed. The departments housed there are cramped for room, and the northern front of the building is meanly hidden along the greater portion. Some of the houses in the Strand, between Somerset House and Wellington-street, have been pulled down, and the sites advertised for sale. A unique opportunity is thus opened to the Government to acquire these sites, and to build thereon public offices as an extension of the front of Somerset House, along the Strand and Wellington-street, in harmony with that already existing. Such a noble building as Somerset House ought certainly to have its principal front in the Strand, whereas now it is hidden behind commonplace buildings, and has only a central entrance from the Strand. If the loss of income from the rents of these shops in the Strand be considered a very serious matter, the ground-floor of the new buildings could be utilised as shops. So long as the Strand front is built as forming part of, and strictly harmonising with, the present edifice, the Government could, at comparatively small cost, "disestablish" the shops whenever circumstances demanded, and absorb their space into the public offices.

The Board of Works are about to extend the Temperate House in Kew Gardens by adding two wings at the north and south ends, which will increase the size of the building by about half its present dimensions. The cost will amount to about £12,000. Among other improvements which are being carried out is the overhauling and re-arranging of the whole of the heating apparatus in connection with the palm-house, and the provision of additional piping, which is to be placed round the lantern in the roof. The south wing of the large conservatory, known as the No. 4 house, is also in course of reconstruction to meet modern requirements. This is the final instalment of the work taken in hand in connection with this house three years ago, and completes the reconstruction of the conservatory.

It is stated that the negotiations for acquiring the property needed for the removal of the houses in Poets' Corner and Old Palace Yard, which were condemned by the Royal Commission on Westminster Abbey, are now on the verge of completion. It was at one time hoped that H.M. Office of Works would continue their bargain before the prorogation, so that the work of demolition could be accomplished during the autumn and winter months. It appears, however, that possession of the property cannot in any circumstances be obtained before the middle of next year, which means that the public will have to wait at least another twelve months before they can form an opinion as to the effect of the addition of a brand new monumental chapel to the Abbey behind the site so opened out. As soon as the houses have been pulled down the space cleared will be turfed over and railed in, a method of procedure which will enable those interested in the Abbey to judge whether a monumental chapel ought to be erected at this point, or whether the Chapter House, having been once rescued from obscurity, ought to be again even partially hidden from sight.

One more of the many cherished beliefs of the various Christian pilgrims to the Holy Land will have to be given up—namely, the so-called "Stone of Job." The village of Saijdeh, which is situated in the neighbourhood of the Sea of Tiberias, according to the traditions of the inhabitants, was the country, or rather birthplace, of Job the Just, and a hill which is within easy distance of the village was known as the "Hill of Job." Near this hill was a stone upon which tradition says that the patriarch rested during his long term of suffering, which in our day has become almost proverbial. This stone was, until very recently, surrounded by a Moslem shrine, for it must not be forgotten that Job was a patriarch as much among the Moslems as with the Jews and Christians. Through some cause or another the shrine has fallen into decay, and the stone which it encircled has been exposed to view. A recent examination of this ancient monument has revealed a most startling fact—namely, that, instead of the stone having any connection with Job, it is really an inscription of Rameses II., the famous King of Egypt, who ruled B.C. 1333, and who is usually considered as the Pharaoh of the oppression. On the top of the tablet is the well-known representation of the winged disc of the sun, under which is the figure of the monarch in the usual Egyptian style, who is giving offering to the goddess Maat. Over the head of the king is his hieroglyphic name "Ra-user-ma-setep-en-Ra"—"The sun, powerful by truth, approved of the sun"—which was the throne name of Rameses II.

The twenty-eighth annual convention of the American Institute of Architects is to be held in New York, in the rooms of the Architectural League, on Monday, Tuesday, and Wednesday, October 15, 16, and 17. Papers have been promised from Messrs. Longfellow, Van Brunt, Sturgis, Hastings, Wight, Sullivan, Gibson, and Clark, and arrangements have been made for securing a full discussion of the papers. The matter of the relation of the chapters to the institute is to be brought up, by the offer of amendments to the by-laws, looking to the admission of all practising members of the chapter to the ranks of the institute, and putting the business of the conventions into the hands of delegates from the chapters. It is several years since a convention has been held in New York, and it is hoped that there will be a full attendance.

As I very narrowly escaped a fatal accident in passing along the Strand on Wednesday evening, it is only reasonable, in the interest of others, that I should point out in the plainest possible terms the urgent need of some protection being always insisted on by the London County Council to insure the public from falling tools or what not when hanging scaffoldings are used over the pavements of street thoroughfares. The Gaiety Restaurant is undergoing a process of rescraping from parapet to basement, and an army of workmen have been busy for the past week or two cleaning down the brickwork and masonry, the work being reached by the ordinary method of hanging platforms. In Catherine-street a cradle inclosure has been employed along the footway to keep rope and other appliances secure against removal, and besides affording some protection to the public by keeping people off the pavement immediately beneath the scaffoldings. In the Strand, however, the several entrances to the theatre and two restaurants no doubt rendered a similar inclosure out of the question, though, as a matter of fact, thousands more passers-by are exposed to danger in the main highway of the Metropolis, rendering it all the more necessary that some effective measure should be employed for their protection. A sort of projecting pent, or even a tarpaulin festooned below the platforms, might be used. As I was passing an iron scraping tool weighing not less than three or four pounds fell immediately in front of me with an alarming crash on to the pavement from a height of about 50ft., or nearly to the top cornice level where the men were at work on a swinging deck, to which no shield whatever was provided to catch falling implements. The Gaiety fireman on duty saw the circumstance, and called out to the workmen to "look out!" As it was by the merest shave that no one was killed, and so narrowly escaping myself, I feel it incumbent upon me to re-echo his words of warning, not to the artificers alone, but to those in authority, that prompt measures may be taken in this respect in the general interest in every case where similar work is in progress.

After serious damage by fire, the old red brick house at the north end of the west side of Fulwood's-rents, High Holborn, and abutting on Field-court, Gray's Inn, is about to be pulled down. This ancient building was at one time the "Court of Requests" for the recovery of small debts for the precinct, and is claimed as having been "Squire's" famous coffee-house — which was the house of entertainment referred to in many papers in the *Spectator*. It was at "Squire's" that the members of the Melbourne and Oate's Clubs met, at which time it was a place of good repute, and frequented by the best-known literary men of the period. Fulwood's, commonly known as "Fuller's," Rents, once formed the principal entrance into Gray's Inn Gardens. It is named after one Fulwood, to whom, by an order dated 1593, the Benchers paid £150 "for a parcel of ground in Holborne for building a gate out of Gray's Inn into Holborne." Pity that the slum could not be demolished, and a suitable entry made through it to the stately gardens of the Inn.

The trustees of the Manchester Corporation Art Gallery have accepted the proffered gift of "Andromeda," by William Etty, R.A.

On Monday, September 10, the twentieth annual exhibition of the Sheffield Society of Artists will be opened in the Cutlers' Hall in that city. On the opening night Professor Herkomer, R.A., will deliver a lecture, and this is to be followed by a conversazione.

On Saturday the foundation stones were laid of a new Primitive Methodist church and Sunday-school at Shotley Bridge, Co. Durham. The edifice is Gothic in style, and the church itself will provide accommodation for 450 worshippers; while the school will have room for 250 children and teachers. The cost of the buildings is estimated at £2,000. The architect is Mr. Geo. Race, Westgate, Weirdale; the contractors being Messrs. Lubbock and Sons, Blackhill.

The excavations for the new tank which is to contain the gas-holder adjoining the Sleaford Gasworks are now in progress. The tank will be 89ft. diameter by 20ft. deep, with a conical-shaped bed covered with puddled clay and bricks. The wall will consist of brickwork, surrounded by puddled clay, and will contain about a quarter of a million of bricks. The gas-holder will be 85ft. in diameter by a depth of 20ft., and will be constructed so that it can be telescoped at a future date, doubling its capacity. It will contain, when completed, 115,000c.ft. of gas. The contractors for the whole of the work are Messrs. R. and J. Dempster, Limited, Manchester.

BOOKS RECEIVED.

The Testing of Hydraulic Cements, by W. Harry Stanger, M.Inst.C.E., and Bertram Blount, F.I.C., F.C.S., is a reprint of a paper read before the London section of the Society of Chemical Industry. The authors contend that both chemical and mechanical data should be available in pronouncing on the quality of cement. The testing of cements by mechanical methods is not absolutely reliable, especially in untrained hands. The various shapes of standard bushel measures, the means of filling them, the gauging and mixing, and the application of the load are not always to be trusted. Although improved appliances are now in use, such as Matthews's automatic apparatus for applying the load to the briquette, and improved measure and hopper to insure equal treatment, there is yet more to be done to make this mode of testing perfectly reliable. The mixing of water with the cement requires knack, not always to be found, and the sieves used are unreliable. The services of the chemist are necessary to determine the composition of a cement and its main physical properties. When both are ascertained, the suitability and safety of a cement for any purpose can be accurately judged. Mr. Stanger's paper is worth reading by all practical users of cements. ——*Transactions of the American Society of Civil Engineers* for June contains Mr. William P. Craighill's address as president at the annual convention, in which allusion is made to national defences. Speaking of armour-plated vessels, he thinks the time will come when ships will be left unarmoured, and will trust to their speed and heavy guns. The first-class armoured warship has become a most unwieldly monster, as was shown by the ill-fated *Victoria*. In 1893 six other ships were lost, and only one of them in actual warfare. Naval architects do not pretend to make an impenetrable ship; the gun always has the advantage. No invulnerable armour ever will be produced. Inland canals are advocated by the president as invaluable in time of war, as that between Philadelphia and New York; he also speaks of the Ship Canal as important in any defensive system, as affording an interior line of water-way parallel to the coast-line. A canal connecting the great bays of the Chesapeake and Delaware would enable a fleet to promptly meet an enemy threatening either of these bays, and be out of danger. Another interesting paper is on "A Concrete Sewer on Piles," by Eugène Lentilhon, jun., Am.Soc.C.E.—a concrete sewer 16ft. wide by 7ft. on a foundation of piles and grillages, and 180ft. long. The sewer walls were made continuous by joints on the "tongue-and-groove" principle, these being grouted. As a sewer constructed in bad ground, the details have interest.

OBITUARY.

Mr. Henry Faija, M.Inst.C.E., died on the 21st instant, of epithelioma, a malignant disease of the throat. Mr. Faija was the son of G. Faija, the celebrated artist and miniature painter to the Queen. He was born at Alfred-place, Bedford-square, W.C., in 1844, and educated at University College School. He was articled to the firm of Westwood, Baillie, Campbell, and Co., shipbuilders, of the Isle of Dogs, E., but the firm failed before he had completed his articles. He then went North, and, for a young man, occupied important positions—first with Messrs. Hopper, of Hull, and afterwards with a firm of shipbuilders on the Tyne. After a brief partnership with a firm of engineers at Stoke-on-Trent, he came to London about 1870, and started practice as an engineer in John-street, Bedford-row. On obtaining a commission to design and erect some cement works, the rough-and-ready methods then in vogue impressed him with the vast field for improvement in that branch of industry both from an engineering and scientific point of view; from that time he made a speciality of cement works, and thus commenced his career as an expert in all matters relating to cement and cement-making materials. He has since designed and erected works for the production of cement in various parts of England and abroad, including Brazil and the United States, and has also received applications requesting him to personally undertake work in South America and other places abroad, which his professional engagements in England prevented him from accepting. About 1880 he removed to 4, Great Queen-street, Westminster, and there established a cement testing room and chemical laboratory, where cement and cement-producing materials were examined and reported upon; the steady growth of this branch of his practice was an indication of how much his opinion was valued, and in 1888 he found it necessary to remove to larger premises. Mr. Faija was a member of the principal engineering and learned societies—viz., the Institution of Civil Engineers, Institution of Mechanical Engineers (1869-1889), British Association, Royal Institute of British Architects (honorary associate), Society of Arts, and Society of Engineers, of which latter body he was vice-president at the time of his death, and but for his untimely removal would have succeeded to the chair in due course. He at various times contributed papers to all the above societies on the subject of which he had made a special study, and was awarded premiums by the Society of Engineers for papers read before that body in 1888 and 1889. The latter papers were prepared with the object of combating the "magnesia" scare which occurred at that time, owing to the Aberdeen failures, and conclusively proved that the supposed destructive effect of sea water on a properly manipulated cement concrete was a scare, and nothing more. In 1881 he wrote a treatise, entitled "Portland Cement for Users," which has since run through more than one edition, and is now included in Weale's Series of Scientific Handbooks, and he has been a frequent contributor to the leading professional papers. The work of his office and laboratory has for some time past been carried out by Mr. Butler, who for many years has worked with Mr. Faija as his chief assistant, and who, by his express desire, will continue to carry on the business for the benefit of the family.

The death is announced of Mr. Arthur Rotch, a well-known architect of Boston, Mass., who succumbed to pleurisy a fortnight since at the age of 44 years. Eleven years ago he provided, with his brothers and sisters, as a memorial of his father, the Rotch Travelling Studentship, by which American students are enabled to study and travel in Europe during a period of two years. After graduating at Harvard College with the class of '71, he studied architecture for two years at the Massachusetts Institute of Technology, and then went to Paris, and enrolled himself as a student at the Ecole des Beaux-Arts. Returning to Boston in the autumn of 1880, he disappointed his friends—who half-expected that, having ample means, he would lead the life of a mere dilettante—by forming a partnership with George T. Tilden, and entering actively on the practice of his profession. The practice of the firm has been confined mainly to dwelling-houses, of which many costly ones have been erected in Boston, Bar Harbour, Washington, and other places; but they have also built the Memorial Church of the Holy Spirit, at Mattapan, Mass.; the Church of the Messiah and Church of the Ascension, at Boston; the Art Museum for Wellesley College, and the Rindge Manual Training School at Cambridge, Mass. A director of the American Institute of Architects, Mr. Rotch was also one of the trustees of the Boston Museum of Fine Arts, and was, toward the close of the work, supervising architect of the Suffolk County Court House at Boston. The Chateau de Chenonceaux was restored under his direct and personal supervision. Last year he organised, and had thus far maintained at his own expense, a department of architecture in Harvard University, and he also paid for the furniture and fittings of the architectural library at the Massachusetts Institute of Technology, which is a model of its class.

Two new reservoirs have just been constructed at the waterworks at Wellingborough—one holding 220,000 gallons and the other 160,000—making the total storage capacity 700,000 gallons. A new 10in. service main has also been laid to supply the continually-growing population of the town.

A new organ, erected at a cost of £1,000, has just been placed in the south transept of All Saints' Church, Falmouth. The instrument has been constructed by Messrs. Hele and Co., of Plymouth, and the case is of oak; the front and west side are enriched by carving. Mr. E. Sedding, of Plymouth, was the architect.

By a fire which broke out early on Saturday morning in the Theatre Royal, Reading, the building was gutted, and the roof destroyed, only the walls being left standing. The building is supposed to have been struck by lightning. This is the second time the theatre has been burned down, the previous disaster having occurred on Sunday, the 31st July, 1870.

COMPETITIONS.

Cairo.—An international competition for a national museum of antiquities at Cairo is now open to the architects of the world, and the Egyptian Government have issued the conditions, which state that the plans are to be sent in on March 1st, 1895, to the office of works, Cairo. A premium of £600 (Egyptian) will be paid to the author of the best design, and £400 will be divided among the authors of the four next best designs. The site for the new building is surrounded on all sides by a garden in which certain massive monuments, little affected by the weather, will be exhibited. Various accessory buildings, such as a dwelling-house for the director, general workshops, and *dépôts de matérial*, will be ultimately erected. Various galleries and laboratories, a library, and administration offices are, in the first instance, to be provided, and are to be so planned as to be easily capable of enlargement as the collections increase. The question of lighting these galleries is one which will require special care, as the glare where the light is so bright as in Cairo, from the top lights used in this country, would be detrimental to the effect of an exhibition. About three-fifths of the galleries are to be on the ground floor. The construction adopted throughout is to be fireproof, and the numismatic gallery, as well as that for jewels, are to be protected by metal grilles. The fine dust, with which the air is often laden in the dry climate of Cairo, is to be provided against in the system of ventilation adopted, and the windows and skylights are not to be open except for cleaning purposes. The style of architecture to be adopted is left entirely to the competitors, but ample space for the exhibition of the objects forming the museum is of prime consideration. The building is to be marked by an imposing character, which will well befit a national emporium destined to hold the antique treasures of Old Egypt. The cost is limited to £120,000. The scale for the general drawings is about ⅛in., but French scales are stipulated. An exhibition of the drawings will be held for 10 days in Cairo before the awards are made by the jury to be appointed for the choice of the plans. Honourable mentions will be given to some of the designs; but all the premiated plans are to become the property of the Egyptian Government. Copies of the conditions can be seen at the Commercial Department of the Foreign Office, Whitehall, London, between the hours of 11 a.m. and 6 p.m. Copies of this programme may possibly be obtainable later on by those who wish to take part in the competition.

Victoria.—The unfortunate competition for the new cathedral of Christ Church, Victoria, B.C., seems destined to failure, and from all accounts to have so-far terminated, landing the selected architects in an unenviable predicament. The firm has dissolved the partnership hitherto existing. Mr. Keith, the junior partner, remains in possession of the contract for the cathedral, and Mr. Cecil C. Evers, the senior architect, has relieved himself entirely of the matter, which up to the present has been a losing concern. Building operations have not yet commenced, and the architect informs us that "absolutely nothing has been paid on the plans and specifications, which are in possession of the committee." "From the first this business has been a very unsatisfactory one, and the other competitors," says Mr. Evers, "can thank their stars that they were unsuccessful, as success in this case has cost us a good many dollars." Quantities for the work were prepared, but no tender has actually been accepted, so far as we can learn. The cost was estimated at £250,000. Sir Arthur Blomfield, A.R.A., as professional referee, selected the design.

Weston-super-Mare.—In the competition for the market buildings the second premium has been awarded to a design, under the motto "Cornucopia," submitted jointly by Mr. S. J. Wilde, of Weston-super-Mare, and Mr. H. Dare Bryan, of College Green, Bristol.

The business premises at the corner of St. Mary's-street and Castle-street, Shrewsbury, have just been reconstructed from designs by Mr. A. B. Deakin, of that town. Mr. W. Bowdler, also of Shrewsbury, was the builder.

The jury of the annual art exhibition at Munich have awarded the first medal to the English painter, Mr. Henry Scott Tuke. Medals of the second class have likewise been awarded to Mr. W. Fusse for painting, and to Mr. Alexander Koch, of London, for architecture.

Engineering Notes.

St. Helen's, Lancs.—Considerable activity is now being displayed on the site of the St. Helen's station for the Liverpool, St. Helen's, and South Lancashire Railway. The large tract of land bounded by Corporation-street, Frederick-street, Standish-street, and Birchley-street has been fenced in, and the levels taken. For the present a temporary wooden platform 450ft. long will be constructed, and in a very short time a single line will be open from St. Helen's to Lowton for mineral traffic. Little remains to be done to bring this about except throwing girders over a portion of the viaduct which abuts on the Hardshaw Fields, bridging Standish-street, which is being lowered, and levelling up the ground. Girders for the single line have already been placed in position on most of the route. The section between St. Helen's and Fazakerley, by which a junction will be made with the Cheshire Lines Railway, and a new route opened to Liverpool and Southport, will be proceeded with as soon as the first section (single line) has been opened.

CHIPS.

The Great Western Railway Company have decided to begin the construction of a line connecting the Severn Tunnel to Avonmouth Dock at Bristol.

The Devon and Somerset Stores in High-street, Exeter, suddenly collapsed on Wednesday night. An adjoining building was being rebuilt, and it is supposed that the supports given to the neighbouring premises were inadequate.

On Thursday in last week, at Messrs. Mowat's saw-mills, Broomloan-road, Govan, a two-story building and a one-story erection containing a store of valuable mahogany were burned.

New offices and printing premises are being built at Winchester for the proprietors of the *Hampshire Chronicle*. The premises, which extend from High-street to St. Clement's-street, are being built from designs by the present mayor of the city, Mr. T. Stopher, and the contractor is Mr. Shearman.

At Birkenhead, on Saturday, two new branch corporation libraries and reading rooms were opened, one at the north and the other at the south end of the borough.

The will of Mr. Alfred Williams, of 70, Bankside, Southwark, engineer, who died on the 20th ult., at 371, Coldharbour-lane, Brixton, was proved on the 15th inst., the value of the personal estate exceeding £17,000.

The first portion of the waterworks for Frodsham has just been completed. The contract for well-boring has been carried out by Messrs. E. Timmins and Sons, of Runcorn, at a cost of £2,750.

Mr. Edgar Teasdel, aged 17, eldest son of Mr. J. E. Teasdel, architect, Queen-street, Great Yarmouth, was accidentally drowned while bathing at Gorleston, last week.

The peal of bells in the tower of Sheriffhales Church, Staffordshire, has been raised from five to six. The new treble has been cast, and the old bells have been rehung and refitted by Messrs. Barwell, of Birmingham.

Among the Bills which received the Royal Assent on Saturday were the London Streets and Buildings, the London County Council (General Powers), the Housing of the Working Classes (Borrowing Powers) Acts, and the London, Walthamstow, and Epping Forest Railway Act.

The construction of works at Horfield, near Bristol, to deal with the sewage of the Ashley Down part of the urban district, and a rural portion which comprises the barracks, has been commenced, and already satisfactory progress has been made. It is undertaken by a joint committee representing the local board and the Barton Regis Rural Sanitary Authority, the contract being let to Messrs. Lloyd and Powell, a local firm. The operations will extend over nine months, and the loan sanctioned by the Local Government Board is for nearly £12,000. The system adopted is known as the International.

The programme for the forthcoming session of the Birmingham Municipal School of Art, which opens on Monday week, September 10, has just been published. M. W. H. Bidlake, M.A., A.R.I B.A., the special lecturer on architectural history and design in building, will in future teach at the school on Thursday evening, as well as on Wednesday; and Mr. William Naughtin has accepted the teachership of certain technical processes connected with the special course for house-painters and decorators. Messrs. Docker Brothers have offered prizes of the total value of £20 to students attending this course.

Correspondence.

ASSISTANT SURVEYORS, WAR OFFICE.

To the Editor of the Building News.

Sir,—If the correspondence on this subject has not already trespassed on your space, perhaps you will include this letter, as I should like to add my quota to the discussion, with whatever authority may be attached to the opinion of a commissioned officer.

I am interested in the matter because, previous to entering the service, I completed architectural articles, and am yet sufficiently related to the profession to feel myself one of the brotherhood. From the one side I can thus share the feeling of soreness with which the members of the R.E.C.S. regard the indignity and slight of their equivocal status; and from the other I can see how demarcating and real it is. Officially, they are treated by military officers with respect; privately, with scarcely so much as is accorded to a non-commissioned officer of the rank and file. It is rather galling to a gentleman to find himself snubbed, with every possible kindness, by persons of whom he is at least the social equal, and invariably the intellectual superior. Naturally the public, knowing nothing of him, treat him in the same fashion. I have known a first-class surveyor, a man of high attainments, asked if he didn't play billiards with the sergeants! You can imagine the comfort of this status at a foreign station, where the circle of gentry is three-quarter military.

Of anomalies that occur in the department in its present shape, I may instance one. We have a division, say, in which the division officer (who is commanding officer) is a captain, and in which the staff consists of a subaltern R.E., a surveyor, and some civil clerks, or foremen of works. The captain goes on leave, and instead of the surveyor, by whom the division is really administered, being appointed D.O., that office becomes one of the "Balbus's" "ornamental heads," by allocation to the subaltern R.E., who is probably as qualified to perform the work of it as his pet poodle is to discuss the artistic merits of waxworks! And this where there can be no question of military discipline, and where the surveyor is said to have the relative rank of captain!

The social question is largely the grievance, but then it is as serious as a dozen. The remedy is not for me to suggest; but if our army pay officers (who are only clerks) and our commissariat officers (who are only shopkeepers) are given non-combatant commissions, I do not see why men who, after all, follow perhaps the most ancient of all professions, should not be given them also.—I am, &c.,

A Commissioned Officer.

Sir,—As "Balbus" has not forwarded his supplement, I hope you will allow me to criticise some of his statements. He advocates the perpetuation of a misrepresentation to the public—that the officers of the Royal Engineers act as architects for War Department buildings—and accuses others of revenge when they attempt to disclose a serious waste of public funds. *Honi soit qui mal y pense.* It is not revenge which actuates, but a *sæva indignatio* at the monstrous imposture which continues to exist, and a desire to run a Works Department on a commercial basis, rather than on one where frequently the combined salaries of the staff amount to over 33 per cent. of the work done. There is no attempt to pull down an existing edifice, but to drag down the false idols, and rid an overburdened department of its drones, or, rather, as one of its military officers frankly admitted, its professional impostors. This cannot be effected except through the powerful agency of the public Press, which can not be burked.

The dreams of the J. G. F.'s salary exist in the imagination of "Balbus." Were the R.E.'s dispensed with, the surveyors could run the department more efficiently without increased salaries. There is no necessity for new taskmasters; the tax-paying public, when changes are advocated, likes to hear of economy, and not of gilded figure-heads, civilians or otherwise. The routine work and buildings up to a certain cost should be carried out by the permanent staff, and larger schemes submitted to public competition. A large sum has been kept back from the profession when we consider that £4,000,000 was voted for barrack reconstruction. Why do architects allow this?

Mr. Ingress Bell should not be designated as a *surveyor*, with a retaining fee of £750 per annum, when he does the work of an architect. It is not creditable to the profession that one of its illustrious members should be called by any other name than that of architect in order to pander to an iniquitous system, nor is it right for a Government department to allow one of its servants to interfere with the interests of private practitioners. Members of the department have been reproved for so doing; but this gentleman enjoys immunity in this respect.

Mr. Tynedale, sanitary engineer, is likewise called a surveyor. Why these *misnomers*, except to hide the incapacity of those who get the credit of the work these gentlemen do?

Tom Pinches may exist in Great George-street or Bloomsbury; but the Pecksniffs there have the merit of hunting up the work, which the R.E.'s have not, their object being rather to hunt it away by the policy of "how not to do it." Two wrongs do not make one right, and the British public would not knowingly tolerate such a scandal.

"Balbus" asks: "Show me any public department without its ornamental head?" He has not far to go—the Army Medical Department. He insinuates that the profession cannot provide men sufficiently dignified to act as heads. It's an ill bird that fouls its own nest, and certainly a very dirty microbe!

He has a diagram showing the life-history of each man;—then, he has more than actuary can give. He says retirements will average three or four per annum. Can he explain why there has been only one promotion since October, 1892, and why there will not be any more till 1895, although the numbers of the first and second classes have been reduced by two and five respectively? The first class can only be considered as seven in number, as Messrs. Ingress Bell and Tyndale figure in it. However he may theorise, surveyors cannot be worse treated, socially and legally, than the architects of the German army, who at least get the credit for the work they do.

If surveyors do not make strenuous efforts they will find themselves a vanishing quantity, and eventually stranded and deprived of their legal rights. Their only hope lies in continually placing before the public the real state of affairs. They have an excellent opportunity, as the officers of Royal Engineers are not efficient in a military sense, through the very fact of vegetating at civil work and neglecting their military duties, and the military authorities are beginning to appreciate this. It is avowedly the intention of the R.E.'s to replace surveyors with quartermasters—another misnomer. It seems strange that the officers of a scientific corps, highly trained, liberally educated gentlemen, should look to their N.C.O.'s to prop them up;—it redounds to their credit! They remind one of that Rabelaisian crew, which gained its livelihood by being pummelled.

I see, in your last issue, an extract from *Indian Engineering*, to the effect that the assistant engineers are getting into disrepute, as they are being recruited from the sailor and jockey class. The R.E.'s reign supreme there, and this is one of their old tricks conducive to the figurehead system. Whatever department they touch withers; public waste concerns them not where their own selfish interests are at stake.

I certainly wish to deter gentlemen from unconsciously offering themselves up to this human Moloch, when powerful bodies like the Institutes of "British Architects" and "Civil Engineers" continue to allow the public to be thus systematically blinded.—I am, &c.,

One Who Was In It.

HANT-ROAD BOARD SCHOOLS, HARTLEPOOL.

Sir,—My attention has been called to an error in the amount of tender of Mr. Watts, which should be £4,344 instead of £4,280, as stated. There was a deduction of £60, which, unfortunately, I have taken off twice.

Can you kindly correct this, to satisfy Mr. Watts, who has just grounds for complaint?

P.S.—I have written Mr. Watts, admitting my mistake.

Apologising for the trouble given—I am, &c.,

J. Garry, Architect.

Church-street, West Hartlepool, Aug. 28.

◆

The organ in the north transept of Bath Abbey has been taken down, and will be replaced by a new one, now being built by Messrs. Norman Brothers and Beard, of Norwich.

Intercommunication.

QUESTIONS.

[11202.]—**Chapel Ceiling.**—Will some of your readers kindly inform me what kind and shape of ceiling is most suitable for a chapel, and which would give the best acoustic properties?—W. S.

[11203.]—"**C.E.**"—I have a very good general knowledge of the building trade in all its branches, am a fair draughtsman, building surveyor and valuer, and land surveyor. I am anxious to know what course to pursue to entitle me to use C.E. after my name. Is it absolutely necessary that I should be articled to a civil engineer? or, if not, can I qualify by coaching by correspondence, and who would be entitled to give me a certificate, and where obtainable? I should be obliged for information as to what course to pursue to enable me to qualify for simple certificate or diploma as C.E., and what for the higher certificates or degrees.—Engineer.

[11204.]—**Weight-Bearing Capabilities of Earth.**—Can any reader give the approximate weight that firm peaty soil would bear? I may say that the gravel bed is about 6ft. from the surface of ground, and the peaty soil above is firm and dry. Is there any simple method of ascertaining how much weight the ground will bear per foot?—One in Doubt.

[11205.]—**The "Hermite" System of Treating Sewage.**—Will any reader of the Building News acquainted with sanitary questions give any information about this process and its effects on sewage? I have not been able to obtain any definite information about the system.—Sanitas.

[11206.]—**Churches in Shropshire.**—I should like to know if there are any interesting examples of old churches in Shropshire, and where they are to be found? Any particulars of them would be thankfully received.—S. S. S.

[11207.]—**Oak Sills.**—Are oak sills more durable than good yellow deal? If they are, why are the latter so much used in house building? Decay begins generally at the bottom just where the sill is placed on the stone sill, and there is more chance of the rain beating underneath. I should like to know if there is any means of checking it?—Builder.

[11208.]—**What is the Best-Shaped Room for Sound.**—The books on acoustics I have read leave one with rather confused ideas as to the best form of a hall for lectures, concerts, or entertainments. Principles are stated which cannot be followed in building. I shall be pleased if a correspondent who has erected rooms of this description will give his experience, and say what is the best proportion and shape of room in section.—Acoustics.

REPLIES.

[11200.]—**Hollow Walls.**—I have adopted a form of hollow wall lately introduced by the New Stone Company, which I consider is good in construction, impervious to damp, and not costly. It consists of an L-shaped block made of concrete, with a fine stone face, and it can be bonded with any thickness of wall, and leaving an air space in the centre.—J. T. Walford.

[11201.]—**Lightning Conductor.**—The fork ought to be higher at least 18in.; but this ought to depend on the size of the house to be protected, and the nearness of rod to ironwork. Mr. Preece stated, in a paper before the British Association, that a lightning-rod protects a conic space whose height is the length of the rod, whose base is a circle having its radius equal to the height of rod; but these and other rules are arbitrary, unreliable, and are repeatedly upset in practice. Effective protection depends on efficiency of earth connection, and other circumstances which would take pages to mention. All metal on the building to be connected, and to the earth, independently of the rod, is a good rule.—G. H. G.

◆

CHIPS.

A special service was held at Llanfairfechan Church on Sunday, dedicatory of the chancel gates and organ screen erected by Colonel and Mrs. Henry Platt, of Gorddinog, as a memorial to their son, Mr. Heyling Platt, who was drowned two years ago at Cashmere.

At Douglas, Isle of Man, on Friday, under instructions from the Douglas Town Commissioners, a quantity of land cleared of the old and insanitary property that formerly stood upon it was put up to auction. Twenty-six plots were sold, and realised £19,900, a considerably larger amount than was fixed as the reserve. Six of the plots sold were purchased for the erection of a new church. Only three licensed houses will be erected where eleven public-houses recently existed.

An infants' school is approaching completion at the corner of Station-street and Stoney Stanton-road, Foleshill, for the accommodation of children from the Paradise district. It will accommodate 175 scholars, and occupies an area of 56ft. square. The contractor is Mr. T. Wright, of Paradise, Foleshill, and the architects are Messrs. G. and I. Steane, of Coventry. The building will probably cost about £1,300.

The parish church of Plaxtol has recently undergone thorough renovation, a work carried out by Messrs. Allcorn and Sons, of Shipbourne. The additions consist of a chancel, which forms the Dalison Memorial, choir and choir vestry, north and south transepts, memorial east window, a stone reredos, brass eagle lectern, and special gifts of altar cloths, service cloths, &c. The Archbishop officiated at the reopening festival last week.

Legal.

NUISANCE BY REPAIRING, &c.

THERE are numerous nuisances and many annoyances in our daily life for which the law can and does afford no remedy. One of these is the repairing or rebuilding of adjoining premises. Such things are, and must be, constantly occurring; and if there was a good ground for any action for damages or an injunction on each occasion, litigation would be endless, and repairs and rebuilding would be rendered much more costly. A bold attempt to get such an injunction was made by the plaintiffs in a recent case against the Aërated Bread Company (8th August). It appeared that the plaintiffs were solicitors, carrying on business at 73 and 75, Finsbury-pavement, where they occupied the upper floors. The defendant company had lately taken the lower portion of No. 73, and were now engaged in making such alterations as were needed to fit the premises for the purposes of their business. These consisted mainly in pulling down an old matchboard ceiling just under the plaintiff's offices, and putting up one made of slabs of plaster, and also in erecting various partitions, staircases, and the like. The contract for the works was to begin 11th July, and complete 20th August. The plaintiffs had complained of the noise, &c., interfering with their business as solicitors, as no doubt it did, and they now asked for an injunction, which would practically compel the stoppage of the works between the hours of 10 and 6, during which they occupied their offices.

Mr. Justice Stirling, of course, admitted that the annoyance was great, but he said that the evidence had not proved that there was any unnecessary or unavoidable noise or disturbance. He laid down the general rule applicable to such cases as clearly being that occurrences of nuisances, if temporary and occasional only, are not grounds for the interference of the Court by injunction, except in extreme cases. As he pointed out, the ordinary user of his land and buildings by an adjoining owner may often be a very real nuisance and annoyance of a temporary and pressing kind; but if on every such occasion there was a right to an injunction as for a legal nuisance, the business of life could not be carried on at all. Every time a neighbouring house is pulled down, or even repaired, there must be noise and annoyance, and dust and disturbance; but, if reasonable skill and care are used in the work of demolition or of reparation, there can be no legal responsibility on the part of the owner. In the present case the defendant company were doing nothing that was unlawful; they were simply altering their premises, and so the action was dismissed.

Fred. Wetherfield, Solicitor.

1, Gresham Buildings, Guildhall, E.C.

Note.—All questions for reply in this column must be headed "Building News," and must reach my offices, as above, by *Tuesday* morning to insure answer same week.

Vici, B'head.—Apprentice.—The offence named would not in itself be sufficient justification for suspension such as is mentioned, and the master could not compel the apprentice to make up the time after the indentures have expired, without it is expressly provided for, nor could the employers legally refuse to pay the apprentice for the time lost.

◆

At a special meeting of the works committee of the town council of Tunbridge Wells, on Friday, Mr. H. Stowell, from the surveyor's office at Salford, was appointed assistant borough surveyor, out of 130 applicants.

An application of the Bootle Corporation for sanction to a loan of £7,000, for sanitary and other purposes, was heard at the Bootle Town Hall on Tuesday, by Mr. Thomas Codrington. Mr. Farmer, the town-clerk, and Mr. Crowther, surveyor, represented the case for the corporation.

The new Roman Catholic church of St. John the Baptist, which the Duke of Norfolk is erecting on the site of the old city prison at the top of St. Giles's Hill, Norwich, was consecrated on Wednesday last. The church was illustrated by a plan and interior perspective in the Building News for April 25, 1884, by an elevation of west front and cross-section in our issue of Jan. 21, 1887, and by a longitudinal section of the nave in that for March 30, 1888. Mr. George Gilbert Scott, M.A., is the architect, and Messrs. Kett, of Cambridge, are the builders The style is Early Decorated. At present only the nave and aisles, 150ft. by 60ft., are built.

LEGAL INTELLIGENCE.

In re C. Payne and Sons.—Under the failure of these debtors, who traded as builders and contractors at Barrington-road, Crouch End, accounts have been furnished showing total liabilities £8,944, of which £7,201 are stated to be fully secured, and an estimated surplus in assets of £505. The debtors have been chiefly engaged as speculative builders in the erection of houses, and they attribute their failure to pressure of creditors and inability to realise their equities of redemption. The estate is being wound up in bankruptcy.

In re F. W. Scott.—Francis William Scott, against whom a receiving order has been made, states that he commenced business in 1885 as a speculative builder at West Ham, Essex, with a capital of £400. Since then he has built 62 houses in the neighbourhood of West Ham and Leyton, being financed as the buildings progressed. The statement of affairs discloses gross liabilities £6,011, of which £749 only are unsecured, the assets, returned at £1,450, consisting as to £1,434 of estimated surplus from securities held by creditors fully secured. The debtor attributes his failure to depreciation in the value of his property, and to excessive interest on borrowed money. Creditors treated as "fully secured" (£5,246) are the mortgagees of the property built by the debtor. The Assistant Official Receiver says that it is improbable that the surplus shown in the statement of affairs will be realised. An adjudication of bankruptcy has been made, and a trustee appointed.

CHIPS.

The Hon. Mrs. Whittuck has offered to rebuild one of the aisles of the nave of Dewsbury parish church at her own cost. This gift will amount to nearly £1,600.

An altar of carved oak, executed by Mr. Gibson, of Edinburgh, from the design of Mr. Basil Champneys, has been placed in the Roman Catholic Church at North Berwick. The front of the altar is divided into five separate panels representing the Annunciation, the Nativity, and emblems of the Holy Eucharist. The sanctuary roof and walls have also been decorated.

The Roman Catholic Church, Inverness, which has just been greatly enlarged and improved, was reopened on Friday by the Right Rev. Bishop Macdonald. The nave of the old church has been considerably lengthened, and new sanctuary and sacristy have been added. A high altar in Caen stone has been erected.

The tramway system at Aberdeen has just been extended from Bloomfield to Bridge of Dee, a distance of half a mile. Messrs. McAdam were the contractors, and the extension was opened on Friday. The lines now extend from the Bridge of Dee to the Bridge of Don, *viâ* Holburn-street, Union-street, and King-street, a distance of four miles through the heart of the city.

The town council of Falmouth having made application to the Local Government Board to borrow £1,800 for the erection of municipal buildings, an inquiry into the matter was held at the Town Hall on Tuesday week by Colonel J. Ord Hasted, R.E. Mr. W. H. Tresidder, joint-architect with Mr. F. G. Bellamy, explained the plans. The total cost of the building would be, he said, about £6,000, and the cost of the municipal block would be a third of that sum. The foundation had been carried down to solid rock. It was mentioned that towards the cost the late Mr. Ferris had left £1,900, and Mr. J. Passmore Edwards had added to this a gift of £2,000. Considerable opposition was offered to the proposal.

Complaints are being made by competitors who are preparing designs to be sent in to the Bristol city council, for laying out the open space above St. Augustine's Bridge—that it transpires that the council have not made up their minds as to the amount they are prepared to expend, and that consequently those preparing plans are entirely in the dark as to whether the outlay will be £500 or £10,000.

An inquiry was held at Taunton, on Saturday, by Colonel Hasted, R E., one of the inspectors of the Local Government Board, in reference to an application from the town council for permission to borrow £5,900, for the purpose of purchasing and laying out Vivary Park and adjacent land as a public park for the borough. The town clerk mentioned that the town already possessed two recreation grounds for children and young people, and it was now desired to secure a park for visitors, invalids, and others. The borough surveyor, Mr. J. H. Smith, produced the plans of the grounds, and gave an explanation of the way in which it was proposed to lay them out.

Hope-street chapel, Liverpool, a Gothic structure built in 1849, was reopened on Sunday after improvement, the provision of new organ and vestibule, and redecoration, the latter work being carried out by Messrs. Bradley, Pass, and Co., of Liverpool.

WATER SUPPLY AND SANITARY MATTERS.

Lucknow Waterworks.—The opening of the new waterworks at Lucknow recently took place. The works are to supply 2,000,000 gallons of filtered water, pumped from the river Goomti, for a population of 200,000, at an estimated requirement of 10 gallons per head per day. The total cost in round figures has been 15 lakhs of rupees. The cantonments of Lucknow have taken advantage of the municipal undertaking, and have added no less than 23 miles of pipes, through which water is distributed all over the cantonments. The total cost of both projects has been over 30 lakhs of rupees, and the whole has been carried out by a firm of engineers and contractors, Messrs. Martin and Co., formerly of Birmingham, and completed in eighteen months.

Morley.—The formal opening of the new waterworks constructed by the corporation took place on Saturday at Queen's Park, Morley. Mr. R. B. Hopkins, town clerk, stated that the waterworks comprised a storage reservoir, called the Withens Clough Reservoir, at Withens, about 3½ miles from Mytholmroyd; two catch-water conduits, and an iron-pipe aqueduct, through which the water is conveyed from the reservoir to Morley. The supplies of water are obtained from gathering-grounds 1,200 acres in extent, and the minimum dry weather quantity is about 250,000 gallons per day of soft and pure water. The storage reservoir and works occupy an area of 80 acres, the water area of the reservoir, when full, being 65 acres. The capacity of the reservoir is 330 million gallons, and the depth of water above the drawing-off culvert is 60ft. The greatest depth of water in the reservoir is 72ft., and the centre height of the embankment above the stream level is 85ft. The level of the overflow of reservoir is 960ft. over Ordnance datum, and the level at which the water is drawn off for supply is 900ft.; and the aqueduct which conveys the water from Withens Clough to Morley is 21 miles in length, and is a line of 15in. iron pipes throughout. The sources of supply were selected, and the works have been designed, by Mr. Charles Gott, C.E., of Bradford, and the contractors for the various works were as follows:—For the reservoir works, Messrs. Fotherby and Sons, Burnley; for the making and delivery of iron pipes, the Staveley Coal and Iron Company; for laying the pipes and iron girder bridges, Mr. David Barry, Ratcliffe-on-Trent, the iron girders being supplied by Messrs. John Butler and Sons, Stanningley; and the valves, hydrants, and fittings by Messrs. J. Blakeborough and Sons, Brighouse.

West Bridgford, Nottingham.—Through a rapid increase in the population of West Bridgford, a suburb of Nottingham, the local board find it necessary to extend the sewerage system, and improve the method of sewage disposal. The local board selected in open competition a scheme prepared by Mr. W. H. Radford, C.E., of Nottingham, and engaged him as engineer for the works. It is proposed to lay a 15in. iron sewer about 15ft. below the subsoil water level, to convey the sewage to the present pumping-station. A new storage tank, about 30ft. deep, will be put in. There will be two new pumps, and a duplicate engine worked from the present boilers. The present sewage farm will be drained, and improved carriers laid down. It is proposed to apply for a loan of £5,000 for these works. In addition to these works, there will be some miles of sewers in private streets, which will be paid for by the private owners.

* * *

A new gas-holder at Rochdale, 120ft. in diameter and 136ft. high, has just been completed.

The Bismarck Monument Committee of Hamburg has requested a Berlin architect to prepare a model for a monument of the ex-Chancellor, to be erected on the Bismarckstein, a hill about 300ft. high at Blankensee, on the Elbe, a few miles below Hamburg. The monument is to be a colossal, castle-like building, with a statue of Prince Bismarck on the top.

Mr. C. F. Fraser, who was until lately Commissioner of Public Works in the Government of Sir Oliver Mowatt, died at his residence in Toronto on Friday last. Mr. Fraser, who was the most brilliant orator in the Ontario Legislature, retired from the Government quite recently on account of ill-health.

The Lord Mayor of Liverpool yesterday laid the foundation-stone of the new crematorium now being erected in Priory-road, Anfield, Liverpool. The building is being erected from plans prepared by Mr. James Rhind. The builder is Mr. Forde, of Birkenhead. The Gothic style has been adopted. The crematorium buildings consist of a chapel, 41ft. by 24ft., an ante-chamber, and a cremating chamber. In the ante-chamber a small daïs or gallery will be set apart for the use of such relatives or friends as may wish to follow the remains to the last, and a columbarium is provided in a crypt under the chapel.

Our Office Table.

The 37th annual report of the Trustees of the National Portrait Gallery states that ten donations have been received during the year, of which the most important are a marble bust of the late Lord Tennyson, copied by Miss Grant from the original sculptured from life in 1857 by Woolner, which was presented in November, 1893, by the present Lord Tennyson, for whom the copy was made, and a bust by Gibson of Sir Charles L. Eastlake. Among the eight additions by purchase is an unfinished portrait of George Romney, painted by himself, which cost £441 at Christie's in May last. The acquisitions include portraits of the father of William III., of Frederick, King of Bohemia, of the fifth Earl Stanhope, of Sir Peter Lely, of Cromwell's favourite daughter, Lady Clay-Pole; of Sir Henry Spelman, the antiquary; of William Martin, the painter of "The Fall of Babylon"; of the first Lord Paget, of the first Lord Erskine, and of Lady Callcott, the wife of the R.A.—the last by Lawrence.

The expectations of the Trustees, that the new gallery, or some portion of it, would be in working order by the spring of this year, have not been realised. In explanation of the delay, Mr. Ewan Christian, the architect, wrote to H.M. Office of Works in March last, stating that the whole of the main building could be finished in about nine months, and the south-east gallery could be finished in one month, if necessary; but it would be preferable to wait a little longer for it. The sudden death of a principal assistant had caused delay in the preparation of work which could not be safely hurried. Mr. Christian considers that the time named may be safely taken as conclusive, but that a considerable period must also elapse between the reception of the portraits from Bethnal Green and other places of temporary deposit and the thorough completion of the gallery for the admission of the public. A supplement is added, signed by Mr. George Scharf, C.B., the director, in which is described a visit paid by the Trustees to the new building last June. Mr. Christian explained the details of the structure, and the Trustees were impressed with the completeness of every portion. The walls and flooring are fireproof, the lighting in the principal galleries is excellent, and wide staircases, with lifts, have been provided. The Trustees state, in conclusion, that their valued friend and colleague, Mr. W. H. Alexander, the munificent donor of this stately edifice, may be warmly congratulated on the completeness with which his noble scheme is being carried into effect.

We mentioned in our issue of the 6th ult. that among the pictures purchased for the National Gallery from the Earl of Northbrook's collection was an "Agony in the Garden," by Andrea Mantegna, a 15th-century artist of the Paduan school This work, which has been numbered 1417, and hung on the east wall of Room VIII., Lord Northbrook has now supplemented by the gift of a page of a 16th-century illuminated manuscript, evidently copied with some modifications and in lighter tones from Mantegna's painting. The reproduction is contained within an initial letter C., surrounded by angelic figures, and is 7in. wide by 8½in. in height, being only a fourth of the size of the original picture. It is numbered 1417a, and is hung behind the door in a little-known octagon apartment between Rooms XII. and XIII, with monochromes and drawings by Rubens and others.

A scheme is on foot for the creation of a new watering-place between Filey and the Brigg on the Yorkshire coast, ten miles south of Scarborough. The site is now known as the Ravine, and is near Filey railway station. The architect to the syndicate is Mr. W. G. Penty, F.R.I.B.A., of York. The land involved in the scheme is some 300 acres, with a sea frontage of two miles. The scheme comprises the construction of a sea-wall from the Ravine to the Brigg, forming a continuation of the Filey sea-wall, completed a few months ago. There will be a parade behind the wall, and the Horndale Valley, some two or three hundred yards from the Ravine, will be transformed into public gardens and a spa, there being a mineral spring of saline and chalybeate water in the vicinity. The parade and gardens are promised to be more extensive than those of Scarborough. The accessories will include a band-stand and a concert hall. The construction of a tramway from the top of the cliff to the beach is now under consideration, and the plans will show an iron pier running into the sea some 1,700ft. In laying out the estate, a portion of the land nearest the cliff will be reserved for villas and bungalows. Behind these will be the town proper, and here the streets will be about 70ft. wide, laid out in the Continental style, with lines of trees and flower plots. Fountains are to be placed at points where the streets cross each other, and at the corners will be more flowerbeds. The plans are nearly completed, and it is expected that operations will be commenced early in the spring of next year. The first work undertaken will be the construction of a sea-wall; but it is at present proposed to proceed by sections. The carrying out of the entire scheme would entail an expenditure approaching a million sterling.

A special meeting of the Taunton town council was held on Friday to consider the report of Mr. Brereton, engineer, of Westminster, as to a proposal to lower the new bridge now in course of erection over the river Tone. Mr. Brereton stated that it would obviously be an advantage if the bridge could be altered so as to allow of a more level roadway over it. On the other hand, the question of whether such lowering would interfere with the passage of floods or with the navigation interests had to be carefully considered. As regarded the possibility of altering the bridge so as to improve the gradient over it, the form of its design and the advanced state of its construction presented considerable difficulties to making any material modifications in its construction. He was strongly of opinion that it would not be desirable or prudent to lower the level of the bridge. The roadway, when completed, would have the comparatively easy gradient of 1 in 35, as against the existing inclinations of 1 in 22 and 1 in 25, and compared favourably with the following important thoroughfares:—Blackfriars Bridge, 1 in 32; Waterloo Bridge, 1 in 31; Southwark Bridge, 1 in 26; London Bridge, 1 in 27. Councillor Wickenden moved that the bridge should be lowered at least 1ft., and said it would be a cause for everlasting regret if the structure were not lowered. Mr. Alderman Spiller, who seconded the motion, considered that there was no engineering difficulty in lowering the bridge. After a long discussion, the resolution was carried, in the teeth of the engineer's report, by fifteen to five. It was afterwards agreed to inform Mr. Brereton of the council's decision, and that the contractor should be asked to give an estimate for lowering the bridge 1ft., and say what extra time he would require for carrying out the work.

A new building material, called compoboard, is being introduced in the North Western States of America. It is made of ⅛in. strips of wood, from ¾in. to 1¼in. wide, placed between two sheets of heavy strawboard and united under heavy pressure with a strong cement. The process of manufacture is peculiar. Into the machine that moulds the board are run two sheets of the strawboard from rolls, one from above and one from below a table on to which are fed from a feeding device the strips of wood. A roller running in a tank of the liquid cement rolls upon inner surface of the sheets of strawboard, and the three layers of material run together between rolls into a powerful hydraulic press; 10ft. of the board is stopped automatically for a few seconds in the press, then run out upon a table fitted with cut-off saws, where it is sawn to the desired length. It is then run upon trucks, placed in the dry kiln, and when taken out is trimmed to 48in. in width. The strength of the board compared with its weight is said to be marvellous. The ends of an 18ft. board can be brought together without breaking or warping it. No conditions can warp it. Wall-paper is put upon the board, and the finish is as fine as upon any plastered wall. The strong points claimed for the board are? It is not more expensive than first-class plastering. It forms an absolutely airtight wall. It stiffens a building much more than any coat of mortar and lath can. It is quickly put on, and produces no dampness. It is light, thus avoiding the cracking of walls and the warping of door frames. It is asserted to form a solider, cleaner, warmer, drier wall at no more expense than is involved in the old way.

The painting of ironwork has been a fertile matter for discussion among engineers. Mr. G. Wallis, at the Association of Engineers of Virginia, recommended the first coat to be red-lead ground in raw linseed oil, used within two or three weeks after mixing, and kept mixed when in use. This coat would dry in 24 to 30 hours. For black finish the next two coats should be made from a paste composed of 65 per cent. of pigment and 35 per cent. of raw oil. The pigment should consist of 65 per cent. of sulphate of lime and 30 per cent. of lampblack, to which is added 5 per cent. of red lead as a drier, the whole thinned to a proper consistency with pure boiled oil. For red or brown finish the paste to contain 75 per cent. of pigment and 25 per cent. of pure raw oil, made up as follows:—50 per cent. of sulphate of lime, 40 per cent. lime carbonate as a drier. Lead paints were not recommended for finishing coats on account of chalking, nor zinc on account of cracking.

The Administration Report on the Railways in India for the year ending May 30th last has just been presented to the Indian Government, in the form of a bulky bluebook, by Lieut.-Col. W. S. S. Bisset, C.I.E., the Director-General of Railways. During the year 489¾ miles of new line has been opened for traffic, as against 451¾ miles the previous twelve months, the total open mileage being now exactly 18,500 miles. Of the new lines, 210¼ miles were constructed on the standard gauge and 279½ on the native gauge, the total length of either width being now 10,596¼ miles standard gauge, 7,636¾ miles mètre gauge, the other 267 miles being made up of various narrower special gauges on branch lines and in native states. In addition to these lines, there are 51¼ miles of steam tramways outside municipal limits. A table shows the progress made in the opening of railways since the commencement in 1853, when a length of 20½ miles of the Great Indian Peninsular system was constructed. The three busiest periods of construction were in 1884-85, when 1,177 miles of railway were opened; 1886-87, 1,012 miles; and 1887-88, 986 miles. During last year sanction was given to the construction of 154½ miles of additional lines. The average cost per mile of railway has been 31,627 rupees. The gross earnings of the year, as compared with 1892-3, improved by 8½ million rupees, and more than eight million more passengers were carried, while there was an improvement in receipts under each of the heads of passenger earnings, other working traffic, and goods tonnage.

The emulation between congregations to provide larger and more expensive church buildings than they can pay for or maintain has become so keen in Canada that at the last meeting of the Toronto Conference of the Methodist church, a resolution was adopted expressing the opinion that additional guarantees should be provided against the unfortunate tendency that prevails for the inception of new and the enlargement of existing church enterprises. Such a moral check is needed here, as well, in all sections of the Church and among all denominations, to prevent the initiation of schemes, which result in the erection of ambitious fragments of structures, to remain a reproach to the promoters as half-finished and make-shift buildings for a generation or two.

Trade News.

WAGES MOVEMENTS.

Glasgow.—Great activity prevails in the building trade in Glasgow. Whilst many trades are quiet and even languishing, masons and stonecutters are employed to a man. It is stated, indeed, that there is work for several hundred more men than are in the district. The present rate of wages is 8¼d. per hour.

* * *

In the case of Henry Cooper, of Crouch End, Finchley, N., builder, the discharge from bankruptcy has been suspended for two years, ending June 20, 1896.

At Cleckheaton, on Saturday, the foundation-stone was laid of a chemical laboratory, to be attached to the Mechanics' Institute and Technical School.

An estimate amounting to £5,000, for the purchase of pictures added to the National Gallery, has been presented to Parliament, making, with the original £13,368, the total £18,368 for the year, for the maintenance of the gallery.

Lady Tweedmouth laid, on the 23rd inst., the foundation-stone of a new church which is being erected for the Queen-street Free Church congregation at Inverness, on the west bank of the river Ness. The church, which is being erected from designs by Mr. J. Pond Macdonald, architect, will cost about £3,500.

Marriage.

SMITH—BROWN.—August 27, at All Saints' Church, South Lynn, by the Rev. W. Leeper, Vicar, assisted by the Rev. J. W. Caldwell, Walter Smith, of Brockley, London, to Bertha Louisa, only child of Mr. W. H. Brown, Builder, London-road, King's Lynn.

W. H. LASCELLES and Co.,

ESTIMATES GIVEN ON APPLICATION.

HAM HILL STONE.
The attention of Architects is specially invited to the Durability and beautiful Colour of this material.
Quarries Well Opened; Quick Despatch Guaranteed; Stonework Delivered and Fixed Complete. Samples and Estimates Free.
Address:—
THE HAM HILL STONE COMPANY,
NORTON, STOKE-UNDER-HAM, SOMERSET.
London Agent:—
Mr. E. A. WILLIAMS, 16, Craven-street, Strand, W.C.

BILLS OF QUANTITIES & PLANS.
T. PETTITT and CO. Lithograph Bills of Quantities with the greatest expedition. Accurately copied from the draft in clear hand. Orders from the country returned by evening mail on the same day. Terms on application. Also Plans of Building Estates and General Plan Work at very reduced prices.—T. PETTITT and CO., Lithographers, 28, Frith-street, Soho, London, W. Established 50 years.

WM. OLIVER & SONS,
MAHOGANY, WAINSCOT, WALNUT, TEAK, VENEER, and FANCYWOOD MERCHANTS,
120, BUNHILL ROW, LONDON, E.C.
The most extensive Stock of every kind of Wood in Planks and Boards, drv and fit for immediate use.

TENDERS.

*** Correspondents would in all cases oblige by giving the addresses of the parties tendering—at any rate, of the accepted tender; it adds to the value of the information.

Badsey.—For new board schools at Badsey. Mr. E. H. Lingen Barker, architect:—

	£	s.	d.
Dowland, W., Abergavenny...	£1,500	0	0
Espley, A., and Co., Evesham	1,445	0	0
Taylor, H., Evesham	1,381	5	0
Gardner, F. W., Evesham*...	1,280	0	0
Panter, D. Pershore	998	15	0

* Accepted.

Barnhill, Broughty Feryy, N.B.—For building nave of the proposed Church of St. Margaret. Mr. D. Carmichael, London, architect. Quantities by Mr. W. H. Elsmore, Barnes:—

	£	s.	d.
Mason:—			
Scott, J., Broughty Ferry	£1,500	0	0
Joiner:—			
Ellis and Machar, Broughty Ferry...	487	2	11½
Slater:—			
Laburn, J., and Sons, Dundee	67	17	8
Plumber:—			
Lorimer, P., Broughty Ferry	35	11	0
Plasterer:—			
Laburn, J. Dundee	29	14	6
Glazier:—			
Parquharson, R., & Sons, Dundee...	94	5	2
Painter:—			
Norwell, W., Dundee ...	50	18	8
Total	2,365	9	11½

[Architect's estimate, £2,370.]

	£	s.	d.
Heating:—			
Boyd, J., and Sons, Paisley	40	10	0

Billingborough.—For alterations at the board schools:

	£	s.	d.
Hotter and Glenn, Billingborough...	£490	0	10
Blood, Bourne	456	8	6
Hockley and Son, Grantham	456	0	0
Sherwin, S., Boston	439	0	0
Roberts, Stamford	430	0	0
Halliday, Stamford	397	10	0
Wadsley and Son, Horbling*	363	12	8

* Accepted.

Birmingham.—For carpentry, upholstery, and seating at the Pavilion Theatre:—
Dean, A. R., Corporation-street, Birmingham (accepted).

Birmingham.—Tor special seating of the galleries at the municipal buildings during the Duke of York's visit:—
Dean, A. R., Birmingham (accepted).

UNEXECUTED DESIGNS.

WHAT becomes of unexecuted designs? Are they consigned to the limbo of forgotten rubbish or preserved in portfolios and picture-frames on the walls of the architect's office? We have never been able to account for them altogether, for we never see them amongst old prints in printsellers' shops, or on the dusty collections of the second-hand bookseller. Might they not be of some marketable value in architectural book-stores, where the speculative builder, or, mayhap, the building owner, could occasionally utilise them? At any rate, we might suggest that even for educational purposes in our technical schools and workshops many of these drawings from the offices of architects might be turned to profitable use. They would be far more instructive than half the published copies which one sees in technical schools prepared by art masters, which often have no practical value, and many members of the profession would no doubt be glad to rid themselves of this lumber of waste-paper at periodical intervals. So much by way of digression from our main purpose. Many architects cherish these old essays: some are framed; sometimes, though we think very rarely, they may be "served up" again to unwary clients. Practitioners of the Mr. Bluster kind like to make a good show of their drawings as designs that have been carried out, even if they are occasionally imaginative, and point to perspectives of town halls, churches, mansions, and hospitals as having been erected in some far-off district or country. A "show" design for a church may pass in this way for the cathedral of Montreal or Timbuctoo, instead of a design sent in for a national competition prize. The imposing Classic or Gothic perspective hanging over the mantelpiece of the principal's office, represented as some Colonial public edifice, may probably have been a Royal Academy or Institute prize drawing for a Parliament House. Academical or otherwise, these designs *in nubibus* adorn the walls of the young aspirant's offices, and give an "air" of importance and dignity in the eyes of the unsuspecting client or visitor. "It is all business," as one adept of the commercial type of architect once said to his partner, to explain his habit of littering the office floor with bundles of letters and specifications. But, after all, it is a harmless and innocent way of advertising. The "unexecuted" design has its commercial value in this way, at least: it lifts us somewhat out of the dull mediocrity of everyday life, out of the mere utilitarian rut, and enables the architect to say, at least, "This is what I intended—this the embodiment of my artistic aspirations unrestrained by parsimony, greed, and mere utilitarianism." It incites the designer to show how high he can soar in the firmament of his art, and to contrast with it the low-level of an utilitarian age; it serves, in fact, as a gauge of what he can do. Unsuccessful competition designs are not without their value in this respect; they represent a vast quantity of unpaid-for labour, not entirely valueless. They are instructive as pointing out what to avoid in the future in the way of plans, also as records of study in certain branches of design and of experience gained. What memories do they not recall of anxious, untiring study, of problems solved, of difficulties overcome The architect is none the worse for all this effort, unrequited though it be. He can reflect on how much the world has lost by not carrying out his design with all the more reason if he happen to know what disappointment the accepted design has caused. The unexecuted design is often a standing reproach to the shortsightedness of individuals and committees, for it shows what could have been done if fair play had been administered and true talent rewarded.

Then we have that numerous class of unexecuted designs which have been made on approbation, and either wholly or only partially abandoned. They are not perhaps so entirely satisfactory, for they represent what the architect intended, but could not get his clients to carry out in their integrity. They are "dreams" of better things, not altogether useless labour. First thoughts are often the best; second attempts often lose the freshness and vigour of the first sketch, and they have to be done "to order," to meet various objections. Perhaps it is the cutting down of a tower here, a bay there, to save cost; the substitution of plainer features of brick for stone. By contrast with the executed building, the abandoned design shows how false hopes may be cherished; how great the difference between a design on paper and a brick-and-mortar reality. We lose the strength of line and shadow—the solidity, frequently the effect, of the original design; the building looks flat and insipid. We can point to public edifices reared for municipal and other uses which testify to these shortcomings, how they have been shorn of features which would have given them dignity and grace. Those who have seen the original designs prepared for such buildings as the Home and Colonial Offices, Whitehall, or latterly the new Admiralty buildings, must have regretted the parsimony of the Government, who have shorn those structures of their intended proportions and features. The original designs remain as witnesses of what their authors intended. By reductions and prunings the real buildings inadequately represent what they might have been.

Unexecuted and abandoned designs have indeed an educational and an historic interest. Wren, Inigo Jones, Thorpe, Sir William Chambers, Sir John Soane, Welby Pugin, and many more have left these records of their work, which have given us glimpses of their intentions, and many of them throw side lights upon their actual labours as architects. Have we not, for example, the designs and models which Wren has left us of his first conception for St. Paul's, of his design for reconstructing the City? We believe the model is now in the South Kensington Museum. We know from his design what St. Paul's might have been—that it was a Greek cross with a central dome, and that the four arms of the cross were joined by hollow curves. Again, Inigo Jones has left us records of his unexecuted designs for the palace at Whitehall, which the Revolution prevented being carried out, except the fragment of the banqueting hall. According to this scheme, we know that the palace would have had an imposing façade towards the river and one towards the Park, besides fronts towards Charing Cross and Westminster; that it had one great central court and three separate quadrangles on each side, and that if it had been executed it would have been the most magnificent palace in Europe, equalled only by the Louvre. Fergusson, indeed, says that if it had been built Whitehall would have surpassed the Louvre and Versailles—an opinion by no means an exaggeration. Thorpe has left us examples of many interesting designs. We know also what even the great church of St. Peter at Rome was intended to be from the design and model prepared by Sangallo—a design based on the Greek cross, but wanting in much of the grandeur and simplicity of Michel Angelo's. These, and many other instances, may be mentioned to show the value as records of designs that have been abandoned. Of course, we have much that is exaggerated and imperfect in these designs. They are not always better than the realised buildings—sometimes they are worse. For example, both Wren's scheme for St. Paul's and Sangallo's abandoned design for St. Peter's are distinctly inferior, and we are better off for their abandonment. Sangallo's great pronaos and lofty steeples were out of character with the centre dome, and Wren's curved transepts would have been poor by comparison with the present edifice. In both these cases the executed design was distinctly an improvement, and the world has gained rather than lost by the rejection of the earlier designs. The authors seemed to have corrected mistakes, and to have adopted better plans, and the designs were both improved by the change. Very often, as in the case of St. Peter's, two or three schemes are prepared by different authors before the building is carried out. Rosselini, Bramante, Raphael, Peruzzi were successively employed before Michel Angelo carried out the design, and, as is well known, the latter was restricted to the plan prepared by his predecessors. Where such is the case the executed, or last, design has the benefit of one or more revisions; each artist brings with him his own resources and the afflatus of his own genius, while he has something to work upon. But revisions by the same author have not always been so happy—in fact, they often lose in process of alteration. The intention of the designer, whether the author knows the design is to be executed or not, has a great deal to do with the matter. In the academic design prepared for the Royal Academy or Art School for simply educational objects, the author is free and untrammelled, his design is simply an ideal feat, or a kind of *tour de force;* but in one prepared for competition, or with a practical object in view, the designer is more restricted, and is less tempted to indulge in exaggeration. The design intended for execution must, therefore, be placed in a different category from that intended only to exhibit the student's prowess in architecture. The responsibilities of the architect in carrying out the design have to be kept in sight in the one case, while in the other they are ignored. The relative value of the two kinds must be regarded. The dreams of the ideal designer of palatial and airy fabrics, full-blown cathedrals, and municipal halls and the like have all the soaring imagination of the aspirant, and are interesting as giving us an idea of the student's power and skill as an artist; but they are often far-fetched. The material is ignored. It may be of granite, of stone, of brick, or of anything as far as we have any indication in the drawing; there is no attempt to show the constructive joints; the hall and staircase are of imposing scale, and the lighting of the apartments and corridors is often problematical.

The legal aspect of the unexecuted design is also of interest. How often it is really paid for is doubtful; or whether the architect is in a position to make any claim. Many an abandoned design's only fault is that it is too costly; others are prepared on speculation, for the sake of inducing a client to build. The law in both these cases is not very clear. If cost is not made a condition precedent, the architect is certainly justified in charging his half-commission. A great many questions crop up which are worth attention. For example, the approval of a design is necessary if it is probationary—that is, if the architect agrees to prepare drawings for approval. Then we hear very often of designs being abandoned from various causes—the site cannot be acquired; the committee or corporation are dissolved; or another design by the same author is chosen. Upon one or other of these causes a claim for remuneration may be disputed; but probably the great majority of abandoned designs may come under the designation of "show" or "preliminary," made to induce people to build, or for the purpose of embodying the objects of company promoters.

BUILDING MISHAPS.

THE alarming collapse of a building in Exeter, though unattended with any serious consequences, affords a fitting text to draw attention to many dangers connected with building operations and pulling down. Metropolitan improvements which entail extensive demolitions are often beset with dangers; but owing to the enforcement of the rules relating to Dangerous Structures and dilapidated and neglected buildings, we hear, comparatively speaking, of a very small percentage of accidents. Shoring and other safeguards are speedily resorted to, and notices are given to owners and occupiers, requiring them, within a specified time, to take down, secure, or repair the premises. In many provincial towns the machinery of the Public Health Act is apparently inadequate to cope with emergencies, or there is some laxity in the administration of the law. The Towns Improvement Clauses Act, which deals with the matter, requires the surveyor to cause a proper hoard or fence to be put up for the protection of passengers, a precaution which is seldom taken in time, and to give notice in writing to the owner or occupier, requiring him to "take down, secure, or repair" within three days. In case no action is taken, the commissioners have power to carry out the necessary demolition or repair. But as a rule there is much delay in issuing the notices, or in seeing them duly prepared and served in compliance with sections 266, &c., of the Public Health Act, and so it comes to pass that, while the surveyor or the town clerk is thinking over the matter before issuing the notices, an accident happens. The surveyor has to make his report, he has to consult the legal adviser, and then there is a delay in the proper service of the notice. Very often a sub-committee is appointed by the Works Committee to inspect the ruined and dangerous structure, and its advice and opinion are often acted on. The only way of dealing with urgent cases of this kind is to give the surveyor *carte blanche* to do as he thinks fit—that is, to empower him to act immediately on his own discretion, and on his own responsibility. The time taken to write a certificate to present it before the committee, or to consult the clerk, sometimes takes several days, perhaps weeks. A high wind may make all the difference between safety and danger to a wall that is unstable, or a chimney that is shaky, and while consultations are being held between the committee and clerk to the urban authority as to whether the case comes within the section of the Act, the mischief may actually happen. We have very often found accidents to have taken place owing to these delays due to hesitation in giving the surveyor power to act. In small towns the surveyor does not like to offend persons interested with properties of this kind, or, at least, he does not like to incur displeasure or offence by acting without being armed with the necessary authority. These are the reasons why the Act does not work so effectively in many towns. The alarm that was caused in the picturesque old High-street of Exeter by the fall of the Devon and Somerset Stores may draw attention to the absolute necessity of immediate action. The reports speak of the whole of the front of these stores having fallen into the street, at the great risk of life, blocking the thoroughfare, yet, happily, owing to the late hour, not attended with loss of life. The building was five stories high, of considerable depth; the side walls of brick, resting on a stone foundation; but the front was of lath and plaster, crowned by a heavy, overhanging gable. A local description says the building in front was apparently old, although the back portion had been rebuilt about 14 years ago, when adjoining premises were taken in. According to this account, the premises were doubtless in a not very sound condition, for plans had been prepared and approved by the city council for erecting a new building on the site of the Apothecaries' Hall, and for converting the front of the stores, and the work was begun some months ago. The Apothecaries' Hall was taken down, and portions of the adjoining premises shored up. The new building was being erected on the rear portion of this site; the stores were also being dealt with when the accident happened. "A section of the upper portion of the side walls had been taken out," and it is said that the front derived its support mainly from its attachment to the adjacent premises; "the front also hung from the roof." From these rather vague descriptions it is impossible to understand the precise cause of the disaster, or whether the removal of part of the side walls had anything to do with the matter. It is enough to know that the old front received support from the adjoining premises, and that these were being removed. The front, in fact, was probably like a great many more old timber structures, and the weight of the "overhanging gable" made it a rather ticklish thing to deal with, as it would naturally have a tendency to fall outwards when its connection with the adjoining walls was severed. No reference is made to the shoring up of the front, which ought certainly to have been done. We have here another warning of the danger of pulling down the rear portion of a building and leaving the front standing, even although, from the newspaper accounts, indications of impending danger were noticed. A crack in the front next its junction with the adjoining premises had been seen by passers-by, and an ominous remark on the danger of the premises had been made.

The cutting away of connections with an old wall is invariably attended with danger, especially when the structure overhangs or exhibits any bulging. A large number of the fronts and walls of houses obtain their support from side and cross walls and ties, and if these are cut away there is little strength left. As many of these old fronts have been cut about for breastsummers and the insertion of shop-fronts, the walls are in anything but a stable condition; if of brick, settlements occur, and the brickwork loses its original cohesiveness, the load being shifted. Instead of a distributed load along the girder, a large part of the centre load receives its support directly by it. The roof also affords a substantial support to a gable, and when the timbers are removed the stability of the structure depends almost entirely on the equilibrium of the wall. If it overhangs or bulges outwards, it can possess no security when it loses its lateral support or tie. In many of the brick buildings in London the timbers of the floors run from front to back, and their ends materially stiffen the front wall. When these floors are removed for alterations or rebuilding behind, the front is seriously weakened, and unless it receives support from shores outside it becomes dangerous. There are five main causes of danger in buildings—(1) bad foundations, (2) excavation or undermining near foundations, (3) want of support below, (4) want of lateral support, (5) want of tie. It is easy to mention under each of these heads examples of failure. In not a few cases two or more of these causes are combined, as in the cases of Nos. 4 and 5, as when a wall has become weak by the cutting away of cross-walls and beams, or an arch or roof thrusts out its supporting walls. Shoring in both the last cases supplies the corrective, as underpinning and needling does for the first three causes.

A LONDON BASILICA.

ARCHITECTS will watch with interest the development of the scheme just announced for building a great Roman Catholic Basilica at Westminster. The type is not exactly new to England, for we have an example of it, fifty or sixty years old, at Wilton, and a much more recent one, by Sir A. Blomfield, at Oxford; but it has never been really naturalised here, and, to all appearance, is never likely to be so. One reason for this is, that it scarcely suits our climate. Architecture has been influenced more by considerations of heat and cold than most of us realise. Why, for instance, are the principal churches of Russia so small? It is not for want of money, since the sums lavished on some of them have been enormous. It is not because the population near them is scanty, for they stand in the midst of crowded cities. It is not for lack of ambition, for, in certain features, they seek to equal or surpass everything in Western Europe. The reason, when one first hears it, sounds appallingly prosaic: it is simply that in a Russian winter large and lofty interiors cannot be kept warm. Now, if a Russian winter induces the architect to diminish the air-space in his churches, an Italian summer tempts him to enlarge it; and here we have, in one of their aspects, an explanation of the vast basilicas of Rome. From the same practical and material point of view, we can see why the chief English churches are less spacious than these, even if they surpass them in the length of their naves and the height of their towers. The Southern European judges of buildings by his feelings in hot weather; the Englishman thinks how they will strike him when it is cold. He does not like the walls or the roofs too far away from him. He is always on the watch for draughts, and his severest criticism is "chilly and comfortless."

No doubt there is a good deal of fancy in all this, and the decision which seems to have been arrived at as to style may do something, in the case of the Westminster Cathedral, to neutralise the fancy. The intention, it appears, is not to produce a Classic or even a Renaissance building, but rather a Byzantine or Romanesque one. The Byzantine style has, of course, been generally associated with the Eastern Church; but there are well-known examples of it, both at St. Mark's, Venice, and elsewhere in Italy. According to Gibbon, the Emperor Theodoric, at the close of the 5th century, erected important buildings in this style, not only at Ravenna, where they still remain, but at Pavia, Spoleto, Naples, and many other places. It is a style that depends mainly for effect on mosaics and surface ornament. It is these, in fact, which redeem the otherwise bare, formal, and mechanical regularity of the basilican type. For what, in fact, is it which goes by the name of a Christian basilica? It is only a vast oblong hall, divided into three, or sometimes into five, avenues, by longitudinal rows of columns and arches. The columns are generally round, and of Classic types. They are very numerous, very tall, and very near each other. The arches which connect them are circular. There are usually no transepts, and no choir; the nave ends, eastward, in a shallow apse. Thus almost the whole space is available for the congregation, and though the multitude of columns would render much of it unfit for Anglican uses, it adapts itself well to the ritual of the Roman Church. The nave is lighted by a kind of clerestory. It has commonly a wooden roof of low pitch, and there are similar half-span roofs to the aisles.

This type, in different examples, is more or less modified. At the very Early basilica of St. Clement, Rome, the long nave arcades are each interrupted in the centre by a wide pier or strip of walling, perhaps designed to strengthen them. At San Miniato, Florence, a well-known church of Later date, the nave is divided by four piers supporting transverse arches, into three lengths of three bays each —a graceful and satisfactory scheme. Sometimes, again, there are narrow transepts at the east end, but no choir, so that the church forms a cross almost of the T shape. But, whatever may be done by such variations as these, the nave arcades and their columns remain the great architectural features of the interior. In English and French churches the architecture becomes richer as it rises. Comparatively plain nave-arches support an ornamental triforium; and above comes all that art can do in window tracery, groined ceilings, or carved roofs. The basilica reverses all this. It begins with lofty marble columns and arches; it goes on with a flat wall, pierced with windows, which often seem designed much more for utility than for beauty; and it ends, overhead, with something which does not differ greatly from a king-post roof. Nothing but its mosaics or its wall-decoration save it from showing a sad falling-off as it rises; but in such interiors as San Apollinare, Ravenna, they do save it, and save it effectually.

If, then, there is to be a basilica in London, on anything like the scale of those at Rome, its success or non-success will depend almost entirely on the matter of decoration. And decoration fit for such a place is a costly thing. It is not likely to be completed in one generation, nor, perhaps, in several; and, if it ever is complete, we may doubt whether the sort of treatment which is satisfactory under an Italian sky will prove equally telling in the murky air of London. Possibly the skilful architect who is intrusted with the work may think well to get rid of some of the blank wall-space by putting upper aisles above the lower ones, an arrangement not unprecedented in the basilican type. How to deal with the exterior of so wide and unbroken a building is, again, no easy problem. By nature it will tend to show itself—after the manner of Cannon-street Station, as seen from the river —immense and intolerable. Here, again, Southern examples seek to fall back on surface ornament and surface architecture, and very often do not get even as far as this. There are still plenty of brick fronts left, which were meant to be overlaid with marble, and plenty of vast churches on which it might be written, "These men began to build, but were not able to finish."

SANITARY PLUMBING.*

A GREAT deal has been written and said of the terrible havoc made from time to time through the agency of defective plumbing work in Great Britain and America, and in most cases the cause has been attributed to the plumber without proper inquiry, forgetting or ignoring the fact that he (the plumber) was entirely guided by the specifications, which, in the majority of cases, were framed on false economy, and very often in ignorance of the subject by the architect. I am now speaking of what I know from experience. As a sample, an architect specified (where the owner would willingly pay for good work) a 4½in. cast-iron rainwater-pipe with red-lead joints for vertical soil-pipe from three water-closets, and, to make matters worse, had it fixed in a recess in wall. When remonstrated with, he said: "Carry out the work as specified, and I will accept all responsibility." I merely mention this as an instance of how the plumber is blamed for defective work when the specifications distinctly give him material to use which renders it impossible to make the work secure for any length of time, and then the architect is the first to fix the blame on the plumber. I sincerely trust, for the sake of all concerned, that the architects of this colony will have all fixed rules and data at their fingers' ends, so that incompetent and unscrupulous persons may be prevented from undertaking the execution of work which they do not understand. I consider every architect should be sufficiently instructed in plumbing to know the difference between good and bad work in course of construction, not after. Too little attention has been given in the past to this important (to my mind the most important) work in a building; hence the great trouble afterwards. At present there is a great diversity of opinion *re* lead *versus* iron for soil-pipes. Modern experience teaches us the great advantages of lead over iron; more especially as we can now secure solid drawn lead pipe of any weight and length suitable to our mild climate. It still holds its own as a material for soil and waste-pipes in all good work, except in America, where the extreme varying atmospheric changes and its position in buildings render it almost necessary that the soil-pipe should be of iron. Still, even in America lead soil-pipe is very extensively used. Lead possesses smoothness of surface (which is essential in soil-pipes), maximum resistance to corrosion and incrustation, can be easily bent to suit any position required, perfectly and securely jointed, branches can be easily inserted at any time, and, last but not least, when useless as a conductor will retain its marketable value as old lead. On the other hand, cast-iron pipes of the size required are never very smooth, especially when they exceed 6ft. in length. How often do we find on cutting a cast-iron pipe an absence of that smoothness (so necessary) from the internal surface, although at each end it had a perfectly smooth appearance? Again, the jointing is never so reliable, no matter how well made; and in the event of any deviation from the straight line and branches usually kept in stock, you have to get special connections, &c., made, which entails additional expense and loss of time. No doubt some will maintain you can procure any description of joint, but experience teaches us differently. Some good authorities, notably Hellyer, prefer that cast-iron pipe when used as a soil-pipe should be galvanised, and afterwards coated with Dr. Angus Smith's solution. The idea looks well on paper; but, unfortunately, in practice we all know the short life of any of the solutions used; and, again, in a great many cases, it helps to cover over defects and imperfections which might exist in the pipe. From practical experience I doubt very much the efficacy of any solution when applied to iron soil-pipes. I prefer them without, although I do not for a moment dispute its qualities as a temporary resisting medium to oxidation in iron pipes, when used as a conduit for fresh water. I am at a loss to know why such good authorities prefer that cast-iron pipe should be galvanised when used for soil-pipe. I am sure it requires no great reasoning to prove that the use of zinc in any way connected with soil or waste-pipes should be studiously avoided and condemned, and no architect or plumber should allow such to be used. Now as to incrustation. I have taken down some cast-iron soil-pipes which had been in use for about eight years. When I examined them the amount of deposit on one side of the pipes, especially at the joints, was incredible; but wherever the incrustation was greatest the pipe was perfect, although you could crush the opposite side with your fingers. No doubt the deposit formed a concrete, and protected the surface covered at the expense of the other side. I might mention it was a medium description of cast-iron pipe, ventilated but improperly. At a recent convention of the Master Plumbers of New York, a section of iron soil-pipe taken from a building was exhibited. The exhibit showed in a practical way the ravages made on iron pipe when fixed as a soil-pipe. When touched it crumbled into powder, although the drain-pipe, which was fixed at the same time, appeared to be in a fair state of preservation, with the exception of a deposit of rust. If required, I could give several instances like the foregoing, with date and place. In speaking thus of iron pipe, I do not for a moment condemn it, as I know perfectly well that it will be largely used in our coming work in Melbourne; but I lay the foregoing points before you in order to encourage a discussion, as by such means only can we arrive at a definite issue. Moreover, as a drain-pipe, I would compel it to be used in all cases when passing through or under a house, for buried in the earth it would be free from the atmospheric influences to which it would be subject when fixed as a soil-pipe; but in all cases care should be taken to avoid the use of galvanised, cast, or wrought iron for soil or waste-pipes, even when disconnected from the drain. Now as to lead soil-pipes, I have often read and heard a great deal about the incrustation on same, but in my experience I have failed to discover anything approaching the incrustation previously described as existing in the iron pipe, even when fixed under much more unfavourable conditions—viz., with no ventilation. One proof of this statement: During a building alteration in the Mercy Hospital, Cork, 1881, I had to remove a stack of 4½in. lead soil-pipe, which had been in position for over 30 years, and was not ventilated. I was astonished at the state of preservation of the lead, the only portion of which that looked suspicious was the soldered seam. I cut the seam out, left the lead to dry, and when I again examined it found no sign of deposit except a small powdered substance. But the lead traps, especially the seal chamber, and above it, when touched, actually fell asunder, being completely oxidised. Still, I do not doubt there have been such cases of incrustation in lead soil-pipes met with, but I have never seen them. One great objection to lead soil-pipe when fixed externally is the means usually adopted for fixing it—viz., soldering lead tack to the back of the pipe, or using ordinary holdfasts, both of which should be avoided, as in the usual course of expansion and contraction (no matter how slight) the lead must suffer at the rigid points where either of the above means are used. A better style, and one that would suit all purposes, is a special holdfast, consisting of the ordinary spike welded on to a bell-mouthed ring with a layer of thick felt and lead flange, which would allow the end of the soil-pipe to be tafted over, and make the ordinary flange (wiped) joint. Also, to fix astragals with strong lead lugs, two to each length of pipe, the holes in the lugs to be larger than the spikes or screws used for fastening, to allow for expansion, &c. By adopting this means you at once remove the objection mentioned above, and make a perfect job. Another objection to lead is the fear of rats, or, as they are called at home, the plumber's friend. I can safely say I have never met with a properly fixed lead soil-pipe which was touched by our friends. I have seen soil-pipes fixed in very peculiar places, where only a rat could get, and I consider he did a good service in compelling them to remove a hidden death-dealer. No doubt in time we likewise shall be asked to fix pipes in unsuitable positions, but I trust we will refuse to do so. No soil or waste-pipe should be fixed in out-of-the-way places, but always where it could be easily examined. Another objection likely to arise in Melbourne is the great heat. Well, to overcome that, I would suggest that all exposed pipes should be cased. The pipes being principally at the rear of buildings will not be an eyesore, and the results to property owners will well repay the outlay. Now, as to the use of earthenware pipes, I would strictly limit their use (in houses) to places where no great harm would result from leakage; for no matter how well laid and jointed, there is always a danger of leakage from various causes (subsidence, &c.), also carelessness of workmen. More especially is this the case in Melbourne, where they allow any handy man to lay and connect earthenware pipes, no doubt reasoning that, being buried in the ground, the water must get away somehow, little caring what damage is done to occupiers or owners of property. I presume you, Mr. Chairman and gentlemen, like myself, have come across earthenware pipe laid with the joints apparently perfect; but on closer inspection have found the bottom without any cement packing, although it was no greater trouble (when fixing) to make the joints equal all round. Recently I was sent to examine a hotel (erected about seven years) where the cellar was continually filled with water. Several inspections as to the cause had been previously made, but resulted in failure, some suggesting subsoil drainage, &c. The first point that attracted my attention was the level at which the water entered the cellar. After examining the houses on either side, I concluded the leak was from a higher level. I presume the point that deceived so many in previous inspections was a cast-iron drain-pipe fixed across the roof of the cellar, and which they naturally concluded extended the full distance under the parlour to the sink in the yard. By adopting a test, I soon found the leak was between the sink and the cellar. When I removed the bricks forming the sink the smell was unbearable; several cavities in the cement bottom contained putrid and decomposed matter, which, on being disturbed, emitted a frightful stench. When tracing, I found an earthenware pipe from sink in yard to cast-iron pipe 6in. from cellar wall, every joint of which was leaking, the end one being separated from the iron pipe, although you could see where it had been inserted in socket of iron pipe. I mention this to prove how unreliable earthenware pipes are when fixed under a building. The brick sink I have mentioned above is very often met with in buildings, with a grating over the top. Why anyone could think of fixing them I cannot understand, as they are the greatest propagators of disease in existence, and should not be countenanced by architects or builders, especially as they can easily procure a surface trap, which would answer a dual purpose—viz., prevent offensive smells and choking of drain-pipes. The bad habit of using earthenware elbows instead of bends is carried out to a great extent in Melbourne, and in a great measure is responsible for so many useless drains. Of late years the practice is to reduce the bore of the soil-pipe to a minimum size compatible with perfect working; but I think the minimum should be 3½in. for vertical soil-pipe (I would fix 4in.). The more the pipe is reduced the greater the chance of siphonic action, especially when two or more closets are connected to it. And even when the soil-pipe is extended full bore to the roof you increase the friction of the vent (the soil-pipe), which under certain conditions fails to prevent siphonage. Under these conditions it shows the absolute necessity of an independent ventilating pipe, into which you connect the branch vents near traps. Of course, no intelligent plumber would think of connecting the vents on to the crown of traps, although some maintain it is the correct place to vent from. Why? We all know that every time the closet is discharged the lighter substances are bound to strike that particular spot, and eventually close it, thereby making it perfectly useless and dangerous, as the vent being closed the trap might lose its seal through siphonage without anyone being aware of the cause. When erecting a soil-pipe, for its size we will have to be guided by the number of closets connected on to it; for two or three closets I would recommend that less than 4in. soil-pipe should not be used, the traps being 3½in. I would also recommend that the soil-pipe be extended full bore 6in. above the highest point of roof, and 6ft. or 8ft. from the nearest dormer or window, and also that a 2½in. or 3in. independent vent-pipe be taken from the point between the end of soil-pipe and surface inlet of disconnecting trap, but below the grating of same. Then fix two 2in. vents from w.c. branches into independent ventilating pipe, and extend same to a level with the soil-pipe. By adopting this system you secure the lightest standard of safety whilst also making a perfect and lasting job, which will well repay the additional cost. When men enter into the kingdom of traps, the first feature that strikes us is the great difference of opinion regarding them, each writer maintaining his is the best; in fact, what spoils some fair technical works is the continual repetition of "my trap," "my ventilator," &c., is the best, leading one to believe the work was written to advance the sale of each writer's wares, instead of advancing the cause of good plumbing, but with all their boasted improvements, the ordinary clear-way P S and horizontal trap still holds its own. The latest writers in this field are Putnam and Smeaton, the former advocating the "Sanitas" as being the only non-siphoning trap in existence and against venting wastes. Of the "Sanitas" I cannot speak, never having seen one in use; besides, as a commercial article, it is useless to plumbers, as no one but the Sanitas Co. will be allowed to fix them. I might say it is for lavatory purposes only. The latter advocates his "Eclipse" trap, which to my mind is a modification of the universally condemned D trap, not even possessing the D's one quality, resistance to siphonage and momentum when unventilated, the outgo being too easy, and the seal only one inch. Besides, it exposes too much surface above water-level, which is sure to receive the particles of fæces bound to adhere and accumulate, as no water can possibly touch a considerable portion of the top surface. To make matters worse, it is a cast-lead trap, the most treacherous of all kinds, and I consider a cast-lead trap should never be allowed to be fixed. I have known cast-lead traps in appearance as smooth and perfect as glass which had, after twelve months' use, to be removed, several defects showing then which could not be detected by the tests to which they were subjected (at least, we are led to believe every cast and machine-made trap is tested). At present we have a lot of mechanical traps on the market—"The Ball," "Flap-Valve," &c., &c., all of which we may set aside, for no matter how well they might act when experimenting, still, after a very short time in actual work they become perfectly useless and dangerous. I will cite a case. In the board-room of a large warehouse, whenever the directors met they complained of a very bad smell. An examination of the fittings revealed the cause: a badly-made trap connected direct into the sewer from a W.H. basin, which being very seldom used the trap lost its seal through evaporation. The plumber called in to rectify it suggested the advisability of fixing a ball trap, which he declared would prevent sewer-gas from entering through the trap, even though no water was in the chamber of the trap. About six months after I had to attend for the same complaint. On removing the trap screw I found human hair around the ball, which held some matches as firmly as if tied with fine twine. Some of the hair had gone over the outgo or weir of trap, and the matches held the ball out of position, thus setting up capillary action at once. I removed the ball and fixed a properly-made P trap, disconnected the waste from sewer, allowing for perfect aëration, with the result—no more complaints. This also proves the advantages of disconnection, for even if the trap lost its seal the above alteration removed the danger and decreased any unpleasantness to a minimum. Of late years a great tendency has been shown towards making traps with a very easy outgo or weir, which is, in itself, one of the main causes of loss of seal, for when a trap is made with an easy outgo its resistance to momentum is considerably reduced; whereas when properly made with the first sections parallel, and the outgo nearly a right angle, you get what to my mind is the proper standard of a trap—minimum amount of water to allow for thorough cleansing at each discharge and maximum amount of seal to resist siphonage and momentumage, of course with proper ventilation. There are other enemies which rob the trap of its seal. First, capillary attraction, caused through hairy or fibrous matter overhanging the weir of trap. Very often it is responsible for unsealing of traps, and is the last thought of. As for loss of seal through evaporation, I need scarcely dwell on that, as I am sure no w.c. will be fixed inside the house, unless for absolute use, and if they should neglect to use it for ordinary purposes, they can at least allow a discharge of water into it occasionally. The only exceptions are our large city buildings, some of which might be vacant for months. In such cases a means can be arranged to flush the traps at certain intervals. All soil-pipes should discharge into a disconnecting trap fixed at the foot of same, the trap to have an iron grating, with large iron bars, to act in a dual capacity, induct for vent and soil-pipes; also to receive the wastes from baths or lavatories. At present there seems to be a misconception about disconnection of lavatory and bath wastes from drain. I maintain you should not connect any of these wastes direct into the drain or soil-pipe any more than you would the rain-water pipe. No doubt a lot is due to misapplication of technical terms. For instance, in a recent publication, *The Decorator's Gazette*, I noticed a trap styled "The Improved Kenon Disconnecting Trap," when in reality it is an intercepting trap, or, if you like, one form of boundary trap. The intercepting trap is fixed to prevent the gas from sewer entering the house-drain, and the disconnecting trap to allow the wastes from baths and lavatories to discharge over or near trap, allowing for complete aëration of waste-pipes. In a great many cases disconnecting traps have been removed after being in use for a short time, owing to the neglect of plumbers in not fixing a vent or exhaust-pipe between the soil-pipe and grating, for when the closet is discharged the column of water in the soil-pipe displaces the air in its descent, and if the vent is not fixed as above the foul air is sent through the grating, thereby causing a disagreeable smell, especially if the trap is fixed (as it very often is) under or near a window or door. Some well-known sanitarians advocate the connecting of drain and soil-pipes direct with the sewer, depending entirely on the traps of w.c.'s and baths, &c., as being sufficient protection against the entry of sewer gas into the house, their contention being that every soil-pipe would help to ventilate the sewer and prevent the accumulation of gases therein, entirely overlooking the possibility of the traps becoming unsealed from causes beyond the householder's control. Whilst a strong advocate of direct and continuous ventilation, I would certainly choose a different means from the above to secure it. The ventilation of sewers is not the province of the householder; that portion can be safely left to the boards controlling the sewer to see after. As a proof of the strides the English system has made, the Technical Sanitary Commission of Paris in 1883, recognising the benefits of disconnection and ventilation, framed their regulations accordingly. Article 5 says all leaders shall be intercepted so as to prevent direct communication with the sewer. Article 7 says every soil-pipe and sink-waste shall be carried above roof to establish active and permanent ventilation, fully adopting the English system. As for sink-wastes, their position will have to be guided entirely by the use made of them, and in the majority of cases it will be necessary to fix a grease interceptor, from which the waste can be conveyed under the grating of disconnecting trap. No doubt some who are against disconnection will argue the dangers likely to arise from such a system, as in the event of a person suffering from infectious disease taking a bath; but with all due respect we might leave that to the doctor to safeguard against. The system is extensively carried out at home, with the most satisfactory results, and I am sure a little consideration will convince the most sceptical of its great advantages. Some writers would use and recommend a non-siphoning trap to all wastes from baths, sinks, and lavatories, depending on the flushing for removal of gaseous accumulations and aëration of wastes; but from observation my advice is to avoid them as much as possible, and go in for ventilation. You will always find, along with being non-siphoning, they are also receptacles for filth. Of course, there are times and places when you will require a special style of trap, and the plumber will be called on to devise a means to overcome that difficulty. In making any kind of non-siphoning trap it is absolutely necessary that the bottom should taper like an inverted cone, as by this means you increase its cleansing qualities without interfering with the seal. A large brass cleaning screw should be soldered on the bottom of trap. A mild sensation was lately created in sanitary circles by the announcement of Doulton's patent joint, for soldering lead to ware, the connecting of which previously was very difficult, chiefly owing to the majority of manufacturers not fixing a flange to ware traps. Whilst not doubting all that is claimed for this jointing, I would much prefer a flange-clamp joint. Its durability entitles it to a much wider scope than it now has. In Melbourne, at present, we are living in a kind of hazy, mysterious atmosphere, regarding the regulations, &c., likely to be framed by the Metropolitan Board of Works. I suppose they will have a special w.c. basin, but I sincerely trust it will not be of that antediluvian pattern (the old gun flush) lately exhibited by Mr. Thwaites, C.E., in his lectures in the suburbs. I cannot understand why a gentleman of his repute could lay before the public a description of closet-pan which would not be tolerated in any civilised part of the universe. It is the greatest retainer of filth ever put on the market, and I thought had been consigned years ago to oblivion, until its recent resuscitation at the above lectures proved otherwise. It will be far better for all concerned to produce the standard article intended for use, especially as they can be easily procured. I presume the regulation will deal with one w.c. in each dwelling. The additional w.c.'s can be of any description (compatible with regulations) the owner may wish to select. Many will maintain that the registration of plumbers under the Metropolitan Board of Works, and the appointing of competent inspectors, will prevent the possibility of bad and indifferent work, but experience teaches practical men to accept this doctrine *cum grano salis*. Some time ago the Board of Health in its wisdom called on all plumbers to register themselves. The result has been that men who do not know the A B C of plumbing (and I believe some who had no claim on the trade) were in one act transformed into fully-fledged registered plumbers. Surely such an intelligent board of "experts" should know that it requires more than the signature of a J.P., or an architect's reference, to make a man a fully qualified plumber. A plumber can be the greatest blessing or curse to humanity.

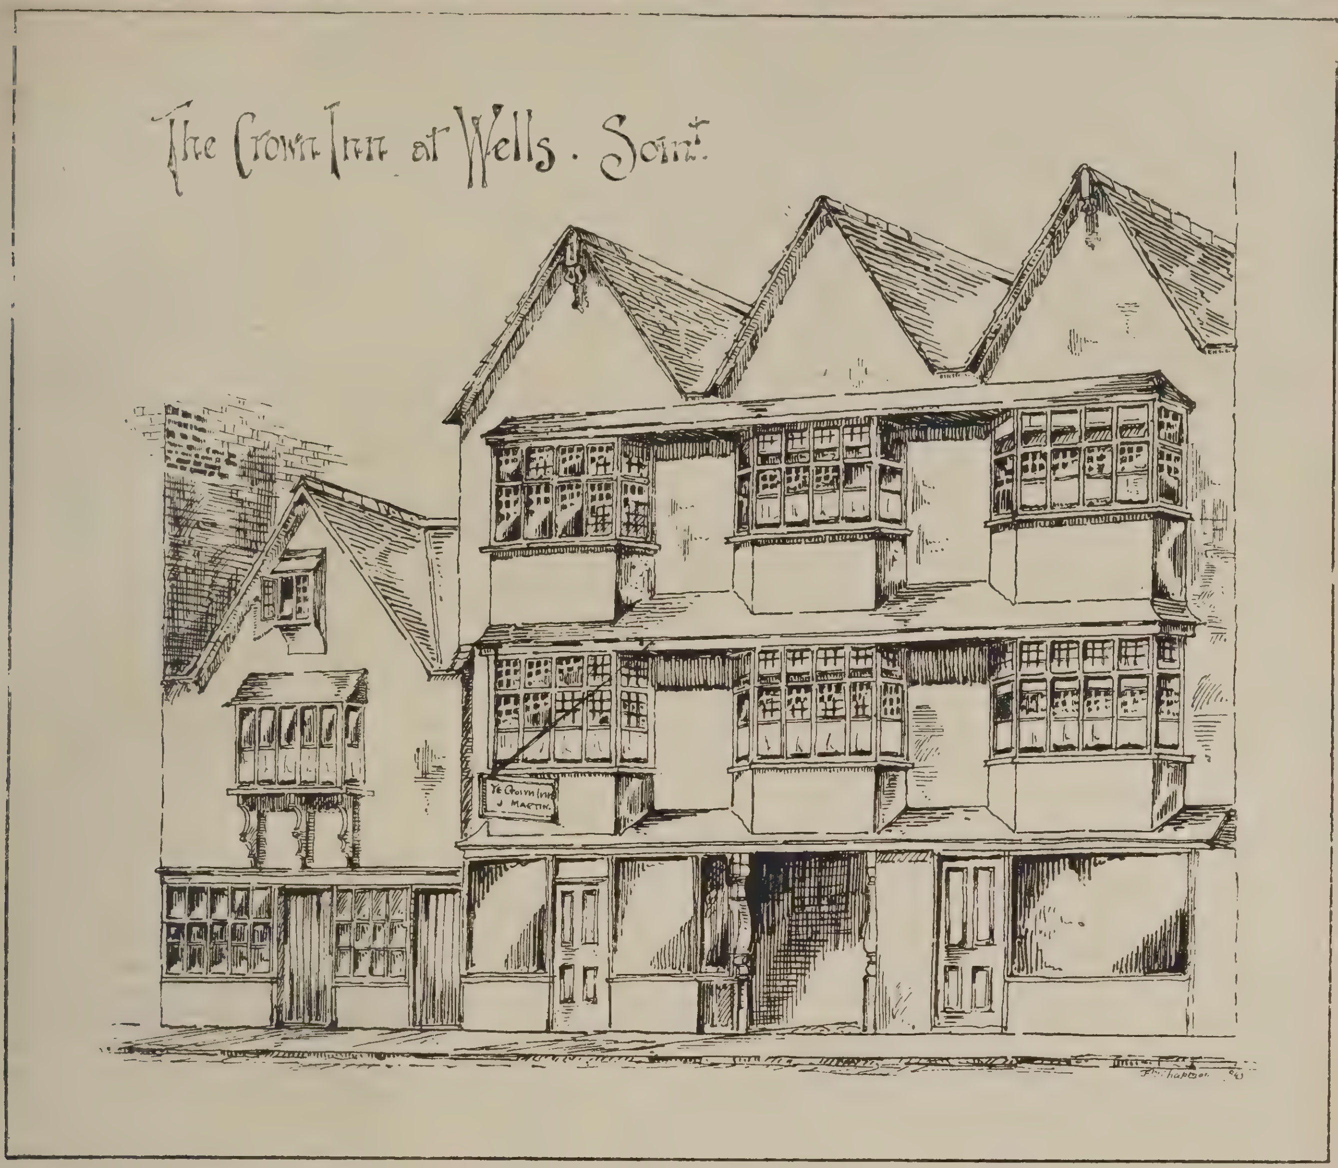
* Paper read before the Associated Master Plumbers of Victoria by Mr. F. B. Brady, Master Plumber.



The Crown Inn at Wells. Somt.
Ye Crown Inn
J. Martin.
F.W. Chapman 94

Which shall it be? I sincerely trust the Board of Works will answer by adopting a standard for those who are to undertake plumbing. I fail to see why we should have quack plumbers any more than quack doctors. Prevention is better than cure. About two years ago, in a certain establishment in the City, a very bad case of typhoid fever occurred, and various reasons were assigned as to its cause. Working there at the time, I suggested that the underground drains be examined, but the manager smiled significantly and refused. A little later on I was sent for to inspect the drainage. The very first thing I discovered was the supposed cause. The overflow from a small covered full cistern (supplying range boiler) was connected directly into the house-drain. The water in boiler was largely used for domestic purposes, &c. The upper portion of overflow was like scorched paper and fell asunder when touched, but the lower portion was perfect, showing that it had been fixed recently. This will show the absolute necessity of preventing quacks from spreading disease and endangering a whole locality. Some of the members present can bear me out in the foregoing, as I showed them the pipe. Plumbing being essentially peculiar and singular in its execution, the public must depend more on the ability and honesty of the plumber than on the best inspection; recent events prove this. Hence the necessity of knowing the status of the plumber you are going to employ. I consider a good system of sanitary plumbing embraces interception with direct and continuous ventilation of soil-pipes, the induct and educt shafts providing the current, whilst the branch vents from below w.c. traps into main vent shaft prevent siphonage or momentumage. The system is the upcast venting which I consider is more in keeping with the laws that guide us. The bath and lavatory wastes are disconnected, and the upper ones are ventilated. I consider it unnecessary to vent the lower bath and basin wastes, for at each discharge from either, the waste is thoroughly aërated. An alternative plan is adopted by some authorities—viz., making the soil-pipe act as educt vent, but I am sure in our day we will not follow the blunders of the past by adopting small measures to secure great results. This plan should be avoided as much as possible, as I consider the vents when returned into soil-pipes mean fixing one to negative the results of the other. I do not recommend any particular style of cowl; I leave that to the plumber or architect. Another kind of intercepting trap might be used.

◆

THE CROWN INN AT WELLS.

In connection with the recent Excursion of the Architectural Association held at Wells in Somersetshire, this sketch of one of the most interesting gabled houses in the city will serve to further illustrate the buildings which give so unique a character to the town. The façade is plastered throughout with pentices connecting the oriel bays which make so marked a feature in the design, and in the centre below is a pilastered opening leading to the hostelry yard behind the premises. The sketch was furnished us by Mr. F. W. Chapman, of Sheffield.

◆

THE RECLAMATION OF THE ZUIDER ZEE.

The Netherlands Government have under consideration a report from the Royal Commission, appointed two and a half years since, to consider the most practicable mode of reclaiming the shallow inland lake created between 1170 and 1410 by successive inroads of the North Sea upon Friesland and North Holland, so well known as the Zuider Zee. The scheme recommended is that propounded by Mr. C. Lely, a well-known engineer, now the Minister of the Waterstraat, and may be regarded as the final outcome of forty years' proposals. Mr. Lely's scheme, as recommended by the Commission, and summarised in a special article in Tuesday's *Times*, is to form a great embankment, extending first from the mainland to the island of Wieringen, and thence right across to Friesland, this work to be followed up by the construction of four enormous polders, which will drain and utilise what are the best parts of the Zuider Zee from an agricultural point of view, and still leave the deep water channels as at present, while the Yssel and some smaller rivers will be free to run into a lake to be known as the Ysselmeer, an outlet therefrom for the surplus waters being provided by means of locks and sluices at the Wieringen end of the northern embankment. The most important modifications recommended by the Royal Commission are an increase in the width of the waterway from Amsterdam to the Ysselmeer, from 1,640 yards to 5,467 yards, and an alteration in the relative sizes of the polders. The embankment stretching right across the northern end of the Zuider Zee from North Holland to Friesland will be the most important feature of the work to be undertaken. According to the scheme recommended, the total length of this great seawall will be something like 25 miles, and it will take at least nine years to construct. Operations will be commenced by the formation of an island on the Breesand, midway between Wieringen and the Friesland coast. This island, when complete, will be provided with a harbour on each side, and the Amstel Diep, which separates the island of Wieringen from the mainland of North Holland, having been closed, the work of constructing the embankment will be carried on simultaneously from four different points—namely, from the two harbours, from Wieringen, and from Friesland. The foundations both of the island and of the embankment will consist of interwoven willow twigs, with earth, sand, mud, and stone rubbish, forming altogether a solid and substantial mass impervious to water. The total breadth of the visible embankment rising above these foundations will be 216ft., and the average height will be 17ft. 8in. above the level of the sea at Amsterdam. The sides will be protected by "facings" of stone obtained from Scotland, Norway, Germany, or elsewhere, and carried above rows of oaken piles to a height sufficient to prevent any injury from the highest tides or the severest storms. The actual summit of the embankment will have a breadth of only about 6ft. 6in., so that carts cannot be driven along it; but a little lower down, on the southern side of the embankment, there will be a level of 55ft. 9in. in breadth, along which will run not only a high carriage road, but a railway, in addition, forming a direct connecting link between North Holland and Friesland.

The locks by means of which access is to be obtained to or from the North Sea will be situated at the Wieringen end of the dyke. There will be two sets of these locks, side by side, one having a width of 32ft. 10in. and a length of 320ft., and the other (for fishing vessels only) a width of nearly 20ft. and a length of 131ft. The size of the larger locks is to be restricted to the dimensions stated, so that they may not afford to hostile war vessels a means of getting into the Yssel Lake. There will, too, be an elaborate system of sluices, provided with both flood and ebb doors. From the same precautionary motives the proposed new canal along the Friesland coast, running from Harlingen in the Yssel Lake at Piaam, is to have for its unprotected locks at the latter place a breadth of only 26ft. 3in.

The northern embankment having been completed, and the Zuider Zee converted into a lake unaffected by tides, the work of reclaiming land will be commenced. The process adopted will be, first of all, to construct, on massive foundations, powerful dykes inclosing the parts of the Zuider Zee to be dealt with. On these dykes, at certain intervals, pumping-stations will be erected, and the water will be pumped out of the inclosed space into the Ysselmeer, from which it will finally escape through the sluices into the North Sea. Each of the four polders will be divided into sections, regulated in size and form by the depth of the bottom. It is part of the scheme that agricultural or other operations may be commenced on each section as it is ready, although the remainder may still be under water. Roads and canals will intersect the polders at different levels in every direction, the water being pumped from the canals at the bottom into others higher up, from these into others still higher, and so on until it can finally run into the Ysselmeer. The drainage, in fact, is all up-hill, no attempt being made to fill up the polders. On the other hand, this canal system can be easily turned to account for irrigation purposes whenever, in dry seasons, it is desired to let water on to the land.

The total of the four polders to be reclaimed represents a superficial area of 750 square miles of argillaceous soil, forming eventually the best land for agricultural purposes to be found in any part of Holland. The proposal is that the whole work shall extend over 33 years, during which period something like 25,000 acres will be annually thrown on the Dutch land market. The total estimated cost of the work, including the construction of the embankment, the draining of the polders, compensation to fishermen, and other items will amount to from £15,750,000 to £26,250,000, while the capitalised value of the land to be reclaimed is estimated as representing a value of £27,166,666. In any case, it is believed that the cost will be covered.

ON THE HEATING POWER OF SMOKE.

IT appears to be generally understood that a large percentage of fuel is lost in the smoke which issues so abundantly from most chimneys, and random statements have been made to the effect that the loss in heating power due to this passing away of combustible matters in smoky furnace gases may reach as high as 30 per cent. of the whole. A little consideration, however, will show that the loss of any large percentage of combustible matter, and consequently of heating power, is quite out of the question. This may be proved in two ways: (1) by calculation of the two sources of heating power as shown by an analysis of coal or dross used for steam-raising, and (2) by actual analysis of the furnace gases for combustible solids and gases. In the following paper are given the results of these two methods of observation, the same dross being analysed and also employed as fuel in a works furnace, from which smoky gases were given off, which were tested for combustible matters. (1) The following is the analysis of the dross employed:—

Gas, tar, &c.	37·63
Fixed carbon	49·97
Sulphur	·40
Ash	2·72
Water	9·28
	100·00
Heating power (practical) due to gas, tar, &c.	1·16
Ditto ditto due to fixed carbon	6·49
	7·65

The points to be observed are the relative proportions of heating power (represented in the analysis by the number of pounds of water at 212° Fahr. capable of being evaporated to dryness by 1lb. of the fuel) given out respectively by the combustion of gas, tar, &c., and by fixed carbon. These are calculated according to Playfair's well-known formula, which was practically tested on coals intended for the British Navy, and which shows that while 1lb. of fixed carbon is capable, when burned, of evaporating 13lb. of water at 212° Fahr. to dryness, 1lb. of the gas, tar, &c., will only evaporate 3·1lb. From these figures it appears that in this coal or dross the gas, tar, &c., only contributes 15 per cent. of the total heat given out during the combustion, and that the fixed carbon produces the remainder, or 85 per cent. In coals with less of the former ingredients and more of the latter, which is commonly the case, the proportion given out by the volatile constituents would be considerably reduced. It is thus perfectly clear that, even though the whole of the volatile matters (which can alone be accountable for any loss of combustible material) escaped combustion, there could not possibly be a greater loss of heat than 15 per cent. of the whole, even in such an extreme case as this represents. (2) An analysis was made of the furnace gases given off during the burning of the dross of which the results are given above, with the following results:—

	Gas very smoky. Per cent. by vol.	Gases almost free from smoke. Per cent. by vol.
Carbonic acid	5·6	3·5
Carbonic oxide	None	None
Hydrocarbons	Trace	None
Nitrogen	79·9	79·9
Oxygen	15·1	16·6
	100·00	100·00

It has been asserted that carbonic oxide is given off in considerable quantity when much smoke is being produced, but it does not appear in this case; and Hempel, in his work on "Gas Analysis," comes to the conclusion that little or no combustible gases are present in furnace gases. In the volume referred to (p. 205) Hempel says: "Furnace gases usually contain only carbon dioxide, oxygen, and nitrogen. All other gases are present in but very small amounts. In oft-repeated analyses the author has always found only traces of carbon monoxide, methane, and the heavy hydrocarbons." This is in complete accord with the analyses given above, and it may be taken for granted that the presence of carbonic oxide or other combustible gases in furnace gases is a most unusual occurrence. This is quite conclusive evidence that no appreciable loss of heat, even when the furnace gases are smoky, can be attributed to the passing away of the products of imperfect combustion in the gaseous form at least. That there is loss of combustible matter in the smoke is an undoubted fact, but the quantity seems also to be greatly magnified in certain random statements. In the experiment referred to above the soot was always collected during 1½ hours with the following results:—

	Grains per 100c.ft. of furnace gases.
Carbonaceous matter	30·81
Ash or mineral matter	20·65
Total soot	51·46

It will be observed that the soot collected consisted largely of mineral or incombustible matter. In several experiments to estimate the soot in furnace gases, similar results to these were obtained, and the average would come very close to the quoted results of this special test. To find how much carbonaceous matter was actually lost as smoke, it will be necessary to know the number of cubic feet of furnace gases given off by the combustion of, say, 1 ton of the dross. If the percentage of carbonic acid in the furnace gases is taken at 5 per cent., the total volume of these given off from 1 ton dross would be about 940,000c.ft. measured at the ordinary temperature and pressure, and this would contain 41lb. of carbonaceous matter and 27lb. of mineral matter. This would represent 1·83 per cent. of the volatile matters (gas, tar, &c.), given in the analysis of the dross, and if from this is now calculated the heating power according to Playfair's formula, it will only come to 0·057. This figure, compared with the practical heating power (7·75) of the dross, goes to show that the solid combustible matter of the smoke can only account for the very small percentage of 0·74 of the total heating power which can be obtained from the coal. From the results of these experiments it is evident that the loss of combustible matters in smoke is very small indeed, and that the belief in immense loss by this cause is simply a fallacy, and is decidedly not corroborated by experiment. In adopting methods of removing the smoke nuisance it must therefore be borne in mind that there is little or no gain in burning smoke, and that other methods of dealing with the problem, such as Dulier's smoke absorption process, ought also to receive consideration.

METHODS OF TESTING HYDRAULIC MATERIALS.*

THE author subdivides the different tests into those made for research purposes, those which are necessary on the delivery of cement, and those undertaken for purposes of identification. Research experiments may comprise everything relating to the composition of cements, the phenomena observed during their burning, setting, and disintegration. These are necessarily chiefly of a chemical nature. Such work is generally undertaken to determine the relations between cause and effect, while practical tests simply record certain facts without inquiring into their cause. Tests made on the delivery of cement should be simple and rapid, their object only being to ascertain whether a given product possesses certain properties which previous laboratory research has shown to be useful, or to ascertain whether other injurious properties are absent. The chief difficulty in carrying out such tests arises from the fact that, unlike metals, hydraulic materials are in a state of continuous development, even for a number of years, and their disintegration is still more gradual. The conditions necessary for the various changes which take place are still but imperfectly known, and the value of such tests must necessarily be somewhat precarious. Having once ascertained that any kind of cement possesses the qualities required, it may be sufficient in obtaining further supplies to carry out certain tests, the only object of which would be to establish the identity of the fresh supplies with those previously examined. It is not necessary in this case that the tests should have any direct reference to the use of the cement, but it is usual to choose such methods as will throw light upon qualities required in practice. In order to secure uniform methods of testing in France a congress was held during the Exhibition of 1889, and a committee of 120 members was subsequently nominated by the Minister of Public Works and charged with the preparation of a report on this subject. Uniform methods are of great advantage both for producer and consumer, but they should not be draughted in such a way as to exclude individual research on any special subject. For the purpose of identification, unification of methods may be more advisable, but even for this purpose uniformity may in many cases be more injurious than useful. The most simple method of securing uniformity of quality in the product supplied is to superintend its production in the factory; this is now done in the case of Government supplies of materials for important works. It would not, however, be possible to have representatives of different private consumers in the factories for this purpose. One difficulty which stands in the way of a uniform specification is the possibility that any test generally accepted to-day may in a short time become obsolete. For instance, the weight of cement was formerly considered an indication of quality, but it is now known to be useless. In considering the process of setting of hydraulic mortars it is held that the phenomena of supersaturation of solutions play an important part. The property of setting in contact with water is possessed by a number of chemical compounds; the author has made some researches on the behaviour of sodium sulphate in this respect, which he considers throw some light upon the setting of hydraulic cements. The setting of hydraulic mortars is attributed to the crystallisation of hydrated compounds which have passed through a state of solution. The different chemical compounds present in hydraulic cements are discussed at some length, as also the phenomena which take place during the operation of slaking. Calcareous hydraulic materials are subdivided into artificial Portland cement, hydraulic lime, natural cements, and mixed cements. The latter include slag cement and other similar compounds. Once set, hydraulic cements are liable to disaggregation from various causes. The first of these is the insufficiency of active hydraulic substances present. Next in importance is the presence of free lime or magnesia, either of which might subsequently slake, and cause the mortar to swell or crack. Physical and chemical agencies are much more dangerous than those due to purely mechanical causes. According to the uses to which the cement is put, these agencies may be classified in three groups—viz., fresh water and damp earth, air, sea-water. Fresh water or damp earth in a state of rest do not cause any special change. The carbonic acid present in most natural waters forms carbonate of lime, and increases the hardness of the mortar. But water in rapid movement, especially when carrying gravel and sand, causes mechanical abrasion, as in the case of all rocks. When exposed to the atmosphere, mortars may suffer from the freezing of water in their pores, and in a very dry state of the air certain compounds present in them may lose their water of hydration and effloresce. Water containing sulphate of lime in solution may cause the disintegration of wall surfaces exposed to the air. In sea water the agents which cause disruption are still more numerous. The lime salts in the mortar are decomposed by the salts of magnesia, leaving a soft deposit of magnesia hydrate. The carbonic acid present in sea water tends to limit this reaction, as it forms crystalline carbonate of lime, which is not attacked by magnesia salts. With highly aluminous cements, swelling or bulging may take place owing to the formation of sulphate of lime in the mass at the expense of the sulphate of magnesia in the sea water. The author subdivides the methods of testing into practical or empirical and scientific ones. The former should assimilate as much as possible to the conditions prevailing in practice, while the latter are necessary in order to ascertain those causes which influence the results. In carrying out tensile tests the author is of opinion that variations of at least 20 per cent. between the results obtained in different laboratories are to be expected, and this difference may even amount to 40 per cent. It is, therefore, useless to draw conclusions from a series of experiments where the variations upon which such conclusions may be based are less than 20 per cent. The fineness of grinding has undoubtedly great influence upon the properties of a cement; but the nature of that influence is not exactly known at present. Coarse grains remain incompletely hydrated, and may to some extent be considered inert matter. They also give rise to cracks and scaling. On the other hand, the fine dust causes cement to set more rapidly, necessitates the use of a larger quantity of water in gauging, and diminishes the permeability of the mortar. It being at present impossible to express in figures either the advantages or disadvantages of any degree of fineness of the cement, it is difficult to base any precise specification upon such tests; upper or lower limits only can be fixed. Although chemical analysis cannot prove that a cement is of good quality, yet it may, in certain cases, demonstrate that a certain product is undoubtedly bad. For instance, a deficiency of silica or alumina will show that a cement is not sufficiently hydraulic. The chief utility of analysis, however, is to indicate the presence of injurious substances such as sulphate of lime or sulphides. The determination of the specific gravity of a cement is practically an indirect method of measuring the proportion of volatile matters present, such as water and carbonic acid, because the normal constituents of cement are so near to each other in this respect that even considerable differences in their relative proportions do not become apparent in the specific gravity. In taking the specific gravity it is of importance to use a liquid of great fluidity, because the inclosed air bubbles cannot otherwise escape. The weight of a given bulk has long been considered as an indication of quality in the case of hydraulic cements. There are other and better tests which indicate whether a cement is underburnt or not, and the weight may now be considered as a means of testing the fineness of grinding. The weight of a given volume of one and the same kind of cement may vary as much as one-fourth, according to the degree of fineness. There does not appear to be any definite relation between the time of setting of a neat cement and that of a mortar composed of 1 part of cement to 3 of sand. The rate of setting of neat cement is rarely of practical interest, that of cement-mortar is of more importance. The setting increases in rapidity with the rise in temperature; but the rate of increase is not the same with all kinds of cement. Care must therefore be exercised to keep the briquettes at a temperature as uniform as possible. When cement is be used in salt water the briquettes should be mixed with salt water. The consistency of the paste from which the briquettes are made should be uniform, and this is not difficult to attain with neat cement; but with sand mixtures uniformity cannot so easily be secured. In the latter case it is better to make the mortar rather dry and beat it into the moulds. In the case of cement-mortars it is probable that the strength depends, to a large extent, upon the compactness of the mass; in other words, the relation between the weight of the cement to the volume of the interstices between the grains of sand. Uniformity in this respect may be secured by fixing the proportion of water according to that of the cement, and beating the briquette until water appears on the surface. In testing the setting of a mortar it is better to make a crushing test than to measure the penetration of a needle, which is so much influenced by the condition of the surface. The relation of the crushing to the tensile strength of cement is not a fixed quantity; but the former is generally about ten times that of the latter. With increased age, the crushing strength becomes greater in proportion to the tensile. The crushing tests are more uniform than the tensile ones; but a difficulty may arise in getting the two surfaces which sustain the pressure perfectly parallel and plane. The author carried out a number of experiments with crusher gauges to test the accuracy of different varieties of machines, the results of which are given in detail. Hydraulic presses are unreliable, especially when the leathers are old, and have been discarded for testing metals. In lever machines the friction may falsify the results to the extent of more than 10 per cent.; but in some kinds of apparatus constructed on this principle, the figures become more reliable as the pressure increases. The author criticises hydraulic and lever machines, and describes a membrane apparatus constructed by himself, in which some of the sources of error are obviated. He is, however, of opinion that, owing to the numerous sources of error in crushing machines, it would be premature to substitute the crushing for the tensile test. It is difficult to arrive at an agreement as to the composition of the mortar to be tested, because the practical and scientific conditions are in this case almost diametrically opposed to each other. Practical considerations would lead to the use of a mortar for testing purposes similar to that in use in practice; but as the proportions of sand and water are subject to innumerable variations no uniformity could thus be secured. As regards the sand, it has been agreed in many countries to use a standard sand, thus getting rid of one of the obstacles to uniformity; but at the same time it is obvious that such a sand cannot even approximately resemble that used in practice. The proportion of water, again, is necessarily less for testing purposes, because a very wet mortar incloses so many air bubbles that the results become irregular. When too much water is used there is also a tendency for the different ingredients to separate in the moulds. By mixing the mortar very dry and beating it carefully into the moulds the same strength may be obtained with a 3 : 1 mortar as with a 2 : 1 mortar gauged of the usual consistence. A distinct connection can be traced between the compactness of a mortar and its strength. Mortars of the same degree of compactness may vary within wide limits as regards the size of the sand they contain, and yet possess the same strength. The age of the briquette at the time of testing must necessarily vary according to the class of substance to be tested. For quick-setting cements for tidal work, six hours may be sufficient; for ordinary quick-setting Portland cement, 48 hours may suffice; while seven days is the usual time for ordinary cement mortars and hydraulic limes. For mortars made with hydraulic lime, 28 days will be necessary. By increasing the temperature during the time of setting, the duration of the test may be much diminished; but the data upon this point are not yet sufficient. The destruction of cement is usually caused by a change in volume, accompanied by cracks. The causes of this change are various; among them may be mentioned the presence of expanding substances—such as lime or magnesia, the action of frost, alternations of temperature, and the action of magnesia salts contained in the sea water, The swelling, caused by the presence of lime, is much more rapid than that due to magnesia. In an experiment cited by the author, in which 5 per cent. of each substance was used in the respective tests, the action of the former commenced in three hours, while that of the latter was not perceptible until six months had elapsed. In some cases the expansion of the neat cement is greater than that of a sand mixture; but sometimes the reverse is the case. An increase of temperature causes a rapid increase in the disruption of the cement; but it appears to be an undoubted fact that some cements which are of excellent quality and have stood well in works in which they have been used, cannot withstand the heat test. The addition of calcium chloride to the water used in gauging cement accelerates the slaking of any free lime which may be present, and therefore prevents subsequent swelling due to that cause. It has therefore to some extent the same action as heating during the time of setting. For measuring the expansion of cement some use a long, straight rod, others a cake of a certain diameter which is made in a split metal mould, the opening of the split indicating the amount of the expansion. Neither for resistance to sea water nor for adhesion is the present state of knowledge sufficient to institute satisfactory tests. The author concludes with a proposed specification based upon the above considerations, and an appendix to the paper contains illustrations of some of the apparatus employed.

BOOKS RECEIVED.

Designing Ironwork. Notes, calculations, stress diagrams, and working drawings for a Steel Box Girder, by Henry Adams, M.Inst.C.E., &c., Professor of Engineering at the City of London College. (London: 60, Queen Victoria-street.)—Mr. Henry Adams, in this second series of useful handbooks in paper covers, reduces, or rather summarises, the mental process involved in designing a steel box girder, and intends to follow this up by examples of other structures in iron and steel. These handbooks are intended to instruct the draughtsman in architects' and engineers' offices in the steps required in working out practical examples of ironwork, of putting into practical form the mode of calculation given in more elaborate treatises. As the author says, it is rather difficult to reduce this kind of instruction to writing, but from a cursory glance at this book we think the author has been successful. The first series contained several useful examples among them, one on designing a wrought-iron girder, which seemed to us to give in a very concise and practical form the method of solving the problem from certain data, supplying at every step the necessary data for so doing, and working out the formulæ. In this little book the student is given a girder of 50ft. distance from centre to centre of the stanchions, and of a depth of $\frac{1}{20}$ span. The width of flanges, net load, weight of girder, effective load, stress in flanges at centre, safe stress per square inch, sectional area of flanges, rivets, depth and thickness of web, angle-bars and flange plates, deflection, &c., are all worked out in figures in the order required, the whole illustrated by a large scale drawing and details. We can fully recommend this book, which is Part I. of the second series, to all students and engineering draughtsmen. The price is 1s. 6d.

MONUMENT TO THE ARCHITECT OF THE ANGEL CHOIR, LINCOLN.

THIS illustration is taken from a photograph of an engraved slab recently placed in the south walk of the cloisters of Lincoln Cathedral. The original slab was found in a terribly mutilated condition, and a plaster cast taken of it some 18 years ago by order of Dr. Benson, who was Chancellor of the Cathedral at that time. It is in memory of Richard of Gainsborough, who was the architect of the celebrated Angel Choir in Lincoln Cathedral. He died on "the 12 Kalends of Junii," 1300. The slab is of Hopton Wood stone, and is an exact fac-simile of the original. It is of the following dimensions—9ft. 2in. by 4ft. 1½in. The work has been done by Mr. Robt. Hague, the cathedral mason.

INDIAN GIRDER BRIDGES.

IT appears that many of the iron bridges in India possess a very precarious margin of safety. Many of these bridges were erected 35 years ago, and were not models of their kind The Government inspectors have not scrupled to condemn these girder structures as too weak to carry the present loads, and to require the replacement of the girders. General Trevor, R.E., chairman of the B.B. and C.I. Railway, thinks the certificates of the inspectors too apprehensive of the safety of these bridges, and says a similar scare was entertained on the Great Indian Peninsular Railway some 25 years ago, when not only were the bridges condemned by the Government and company's officers, but actual failures had taken place. But most of those condemned bridges are still standing, and have been in constant use, and have never caused an accident. What he says is, that under the dominion of civil engineers new rules have been devised, and the old girders are weak when tested by those rules. He admits they were not first-class jobs in workmanship or design, that cracks have been found in some of the tension bars; but they are not in any appreciable degree dangerous.

We cannot express an opinion about structures we have not seen; but the admission that the workmanship and design of the bridges are both bad, that the pins are too small, and the chord bars unequally strained, is enough to convince any engineer of the unreliable condition of these structures. With the increased weight of locomotives and additional traffic, bridges erected 35 years ago with faulty workmanship can hardly be said to be very safe, or that the danger of collapse is not greater now than it has been during the last 30 years. On this and other questions there appears to be considerable ill-feeling between the civil engineers and the royal engineers. There has always been a feud between them, which has grown rather than diminished. But the safety of the Indian railway girder bridges is a question which ought not to be confused with these discords, as it is solely an engineering consideration, and the new rules prescribed to be followed are reasonable and just for present requirements.

OBITUARY.

Mr. Henry Lawrence Hammack, J.P., D.L., the head of the old-established firm of architects and surveyors practising in Norgate-buildings, Clark's-place, and formerly of 59, Bishopsgate-street Within, under the style of Hammack and Lambert, died last week while on a holiday visit to Germany, aged 67 years. He was one of the oldest members of the City Corporation, having been elected to the Court of Common Council in 1865, and annually reappointed down to this year. In 1881 he was made deputy alderman of the ward. He was one of her Majesty's lieutenants for the City and Tower Hamlets, and a justice of the peace for the County of London. Mr. Hammack's death causes a vacancy in the Common Council and in the deputyship of his ward.

Mr. Robert Grierson, architect, died on Friday at his residence, Tan-y-Vron, Bangor, after a short but severe illness. The deceased, who was comparatively young, was for some years the principal assistant with Mr. Richard Davies, architect, Bangor. Some eight years ago he commenced practice for himself, and his designs were accepted for several important works, including the North Wales Training College at Bangor (illustrated by perspective and plans in the Building News for December 30, 1892), and the proposed new schools at Llanrwst, Festiniog, and the Friary, Bangor. He was a member of the Royal Cambrian Academy of Art, and several of his architectural designs are in this year's exhibition at Plas Mawr, Conway. He leaves a widow and family.

Mr. John Cunningham Moncrieff, F.R.I.B.A., of Athenæum Chambers, Nicholas-street, Bristol, died at his residence, Clifton, Bristol, on Tuesday, at the early age of 43 years. He joined the Royal Institute of British Architects as an Associate in 1882, becoming a Fellow four years later. He was also a Fellow of the Bristol Society of Architects.

Mr. Stephen D. Hatch, a well-known New York architect, died suddenly a fortnight ago at Plainfield, N.J., where he was spending the summer. Mr. Hatch was born at Swanton, Vermont, Feb. 16, 1839, but had spent nearly all his life in New York, where for many years he was very prominent in the profession. The Boreel Building, on Broadway, and the Murray Hill Hotel are, perhaps, his most important works, but he designed a large number of costly mercantile and other structures.

Jan Vrolyk, one of the best-known painters of Holland, has just died at The Hague, at the comparatively early age of 48, and in the height of his popularity as a painter of landscape and cattle. His representations of the green fields and pastures of the Netherlands are known throughout the world. Many distinctions were conferred upon him at the great European exhibitions. Vrolyk was a member of the Royal Dutch Committee for the assistance of young artists.

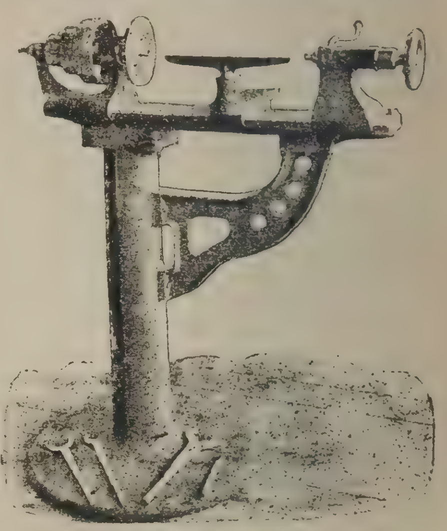
A TECHNICAL SCHOOL WOOD-TURNING LATHE.

WE present herewith a reproduction of a photograph of a lathe designed and built in the Department of Mechanical Engineering, University of Illinois. In describing the lathe, we cannot do better than print what Prof. W. H. Van Dervoort, M.E., of that institution, says about it in a letter. Prof. Van Dervoort says:—I inclose you a photograph of a novel form of wood lathe we have recently brought out and styled a "technical school wood lathe," as it has been designed specially for use in technical school shops, yet would be found highly efficient for any class of light turning.

The lathe swings 10in. over bed, and takes 18in. between centres. The cone runs on a quill, thus removing all belt tension from the spindle, which is of steel running in an accurately ground taper bearing forward, adjustable to compensate for wear. The tail spindle is ground and accurately fitted to its bearing. The face-plate is removed by means of a wrench fitting a milled hexagon on the hub. The rest is of a convenient form, being locked in both of its principal adjustments by a single screw operated by a fixed wrench at the back. The lathe is accurately constructed, and may be used to good advantage as a hand lathe for light metal turning, polishing, and drilling. All the necessary special tools and jigs for the accurate, rapid, and systematic construction of these lathes have been provided, and the lathe will constitute one of the principal articles built by our students under the direction of skilled mechanics. We shall equip our wood shop with twenty of these lathes as soon as possible, arranging them back to back in pairs, and five pairs in a row. Will drive each row of ten lathes with a single belt from the line shaft by using an auxiliary shaft carrying all the drive cones, which will be supplied with friction clutches, so that each lathe may be stopped or started at will.—*American Machinist.*



* * *

CHIPS.

The technical school at Dewsbury is about to be extended, from plans by Mr. J. Lane Fox, of that town, at an estimated cost of £1,500.

New and extensive showrooms are now being erected for the Gloucester Waggon and Carriage Co., Limited, and special consideration has been given to the ventilation, which will be carried out on the Boyle system, the latest improved form of the patent self-acting air-pump ventilator being adopted for the extraction of the vitiated air.

The next monthly meeting of the London and Provincial Builders' Foremen's Association will take place on Saturday, Sept. 15th, at 7 p.m., at the Memorial Hall, Farringdon-road, E.C.

Sir F. De Winton has officially informed the Mayor of Leeds that the Duke and Duchess of York will open the new buildings at the Yorkshire College, erected from the designs of Messrs. Alfred Waterhouse and Son, on Friday, October 5.

The report of Mr. Courtney's Commission on the Unification of London is neither wholly favourable to the County Council nor the Corporation. The model which the Commissioners will recommend will be similar to that of Paris—namely, that London shall be carved into eight or more divisions, or arrondissements, each with its mayor and town council. A Central Body is proposed to be organised, with the Lord Mayor as its president; but its powers will be comparatively circumscribed, since the main object to be attained is decentralisation.

During the process of demolishing the old infirmary at Derby, to make way for the new institution, an old wall suddenly collapsed on Wednesday, and, breaking through the floor beneath, buried six workmen. Four men were killed, and the other two were removed to the new wards in a critical condition.

At a special meeting of the Durham Town Council, held on Friday, the report and plans of Mr. Fowler, C.E., for taking the drainage of the town from the Wear and otherwise disposing of it was submitted to the members. The cost of the scheme is estimated to be £30,000, exclusive of the cost of land, of which some 17 acres will be required. The cost of dealing with the sewage by chemical process would be about £450 per annum. It was agreed to circulate the report amongst the members.

Our Illustrations.

THE TOWER BRIDGE, LONDON.

We have already given several sheets of details with a completed elevation and plans as well as a photographic view of this great work*, and to-day we finish our series of working drawings of it, by publishing herewith a plate of details of the mason's work to the abutment towers which span the approaches to the bridge proper. The various plans furnish sections of these abutments at their different stages, and the vertical transverse section shows the staircase arrangement. These drawings, like the others, were prepared by Mr. Geo. D. Stevenson, A.R.I.B.A., who was associated with the engineer, Mr. Wolfe Barry, C.B.

THE POULTRY CROSS, SALISBURY.

This drawing is one of those to which we awarded consolation prizes in our late competitions for "Drawings illustrating the Picturesque Treatment of Architectural Subjects." The Poultry or Butter Cross at Salisbury is said to have been built in the 14th century, and was erected as a penance by the Earl of Salisbury, in consequence of his having had a tendency to believe in the teachings of Wycliffe. It was decreed by Bishop Rulph Erghum, that he should build a cross within the city and present himself clad only in his shirt, and barefooted every Friday morning as a penance for his sins. The shields on the centre are supposed to have been inscribed with particulars of this degrading sentence. Some authorities, however, doubt this statement, as the cross is mentioned in a deed of 1335, some time after Wycliffe had begun to preach, so that while the cross was no doubt erected as a penance of some sort, the real origin of it is lost in obscurity. It was restored some 45 years ago when the present pinnacles were added to it. The drawing is by Mr. T. C. Smith. A drawing of the Cross by Mr. J. R. Hutchinson was given in the Building News for July 24, 1885, and a woodcut sketch by the late Alfred Rimmer in our issue of August 24, 1883.

SCULPTURE AT THE ROYAL ACADEMY, 1894.

We complete our series of photographic illustrations of typical specimens from the Sculpture Galleries this year at Burlington House, by the four selections which furnish the accompanying double-page plate among our lithographs to-day. Taking them in the order in which they figure on our sheet, the first is Mr. Paul R. Montford's "Spinning Girl," a chaste statue with an exquisite profile, well realising the sculptor's sense of female beauty. The second group faced the first in the Central Hall of the Royal Academy, one on either side of the central archway. It is "The Goblet of Life," by Mr. Albert Toft, illustrating Longfellow's lines:

> "Filled is Life's goblet to the brim!
> And though my eyes with tears are dim,
> I see its sparkling bubbles swim,
> And chant a melancholy hymn
> With solemn voice and slow."

There can be no question as to the grace and reserved dignity of Mr. Toft's conception of the poet's ideal. The pathetic maiden seated on a pedestal holds the bowl in her left hand, and in her right fingers is a sprig of fennel, emblematic of sorrow. The principal exhibit in the same hall was Mr. Henry C. Fehr's masterful bronze group of "Perseus Rescuing Andromeda," which was bought, it will be remembered, by the Chantrey Bequest, and it unquestionably ranks as one of the leading works of the year. The last statue is Mr. W. Goscombe John's model for a fountain figure of "St. John the Baptist," a life-size work, well worthy of its author's acknowledged capabilities and increasing repute.

THE "MECHLIN" MANSIONS, BROOK GREEN, W.

These residential flats belong to a series in the Haarlem-road, Brook-green, Hammersmith, the others being known as the "Dordrecht" and the "Utrecht" mansions, and all were built by Messrs. Leslie and Co., of Kensington, from the designs of Messrs. Lewen-Sharp and Arpin, architects, Adelphi, W.C. The fronts are faced with red bricks with Doulting stone bands and Portland stone landings. The roofs are covered with tiles. Each flat contains two sitting-rooms, two or three bedrooms, kitchen, bath, and w.c., with a coal cellar in the basement. The rentals are from £40 to £70 a year for each flat. The plan given with the view exhibits the internal arrangement on the first floor. We gave views of the other flats in the Building News for March 7th, 1890. The drawings in all cases were exhibited at the Royal Academy.

LOWER KINGSWOOD INFANT-SCHOOLS.

These schools have been built for the Banstead School Board by Mr. I. A. Murrey, of Lower Kingswood, Surrey, from the designs of the architect to the Board, Mr. H. D. Searles Wood, F.R.I.B.A., of 157, Wool Exchange, Coleman-street, E.C.

CLV. AND CLVII. HIGH-STREET, CAMDEN TOWN, N.W.

These two shops, which we illustrate, have frontages to the High-street and to a narrow side street. The aim of the design has been to get a simple and inexpensive treatment for such a site. The contract has been carried out by Messrs. Gould and Brand, of High-street, Camden Town. Mr. Edward J. Bennett, A.R.I.B.A., of Gravesend, was the architect. The illustration is from a drawing in last year's Royal Academy.

"MOGADOR," CHRISTCHURCH PARK, SUTTON, SURREY.

The treatment of the plan of this house was greatly influenced by the desire to prevent the windows of the reception rooms overlooking the garden of the adjoining house, which, owing to the levels of the site, was very exposed. Mr. H. D. Searles Wood, F.R.I.B.A., is the architect.

GRAFFHAM GRANGE, GUILDFORD.

This illustration of Graffham Grange, near Guildford, shows the south elevation, which has been regenerated from the Domestic Gothic style to a more convenient character to correspond with additions made to the residence. This portion was not pulled down owing to the fine creepers on the walls, which were desired to be retained by the owner; but the character has been altered both externally and internally as far as possible, though necessarily the outline had to be retained. The stables have been treated in a slightly different manner with red brick and stone dressings and oak half-timbered work. The whole of the buildings, including the stables, and also extensive conservatories which cover an area of about 8,000ft., are lighted with the electric light, generated by steam power on the premises. The general contractors are Messrs. Creaton and Co. of Lancaster Gate. The elaborate stone and wood carving was done by Mr. James McCulloch, and the architect for the work which has been carried out throughout the estate is Mr. A. Burnell Burnell, F.R.I.B.A., of London and Woking.

CHIPS.

The public installation of the electric light at Hampstead, which is being carried out by the vestry, will take place on October 1st.

The parish church of South Croxton, Leicestershire, is to be restored under the direction of Sir A. W. Blomfield, A.R.A., at a cost of about £1,700.

A bust of the late Earl of Derby, K.G., executed for a body of subscribers by Mr. Thomas Brock, R.A., was formally presented to the city of Liverpool on Thursday in last week. It will be placed in the town hall.

The vestry attached to the south transept of St. Alban's Cathedral is being enlarged, and the south transept window is being renovated. The works are being carried out by Messrs. Longmire and Burge, of London and St. Alban's.

New board schools at Acomb, a suburb of York, were opened last week. They have been built from designs by Messrs. Demaine and Brierley, of York, and accommodate 320 scholars. The chief room is 58ft. by 22ft., and the two wings are each 42ft. by 20ft. Messrs. Hudson, of York, were the contractors. Boyle's ventilators and Shorland Brothers' stoves are adopted.

The chairman of the Leyton local board has laid the foundation stone of new public offices and a technical institute in course of erection at Leyton. The new buildings are being erected by the local board at a cost of over £20,000, and the present town hall will in future serve as the public library.

The memorial to the late Dean Herbert, of Hereford, was originally proposed to take the form of filling-in with stained glass the windows in the south aisle of the nave of Hereford Cathedral immediately opposite the entrance from the north porch. Mr. C. E. Kempe, of London, has prepared a design for the window; but as the subscriptions have exceeded the required amount, it has been decided to fill the large south transept window instead.

A special meeting of the Dawlish Local Board was held last week to further consider the proposed harbour and pier schemes. Mr. E. J. Coombe, engineer, of Liskeard, was present to explain his plans, which were as follows:—£17,500 for a proposed harbour; £6,500 for a north arm wall, the first section of the proposed harbour scheme; £2,300 for a landing stage under Lea Mount; £3,700 for a pier and landing stage off the railway viaduct; and £300 for a landing stage off the last site. After a long discussion it was resolved to abandon all the schemes with the exception of the last, which was adjourned for future consideration.

There has just been added to the Geological Gallery of the Natural History Museum at South Kensington the cranium of a true British lion (*Felis spelæa*) from the brick-earth deposits of the Thames valley at Belvedere, near Erith. This specimen, and numerous remains of mammoth, bison, bos, and rhinoceros from the same locality, have been presented to the Museum by Mr. F. C. J. Spurrell.

Extensive alterations are being made at the entrance to Christ Church from Broad-street, Bristol, the work being carried out by Messrs. Wilkins and Son, under the supervision of Mr. Henry Williams, architect, of the same city.

There is now in course of completion another mission-hall for the Cardiff Forward Movement, and the Right Hon. Lord Tredegar laid the memorial stone on Thursday in last week. The hall stands at the corner of Clive-road and Daisy-street, Canton. It is built of stone, with white brick and freestone dressings, and has a slated roof. Messrs. Habershon and Fawckner, of Pearl-street, Cardiff, who have designed the larger halls in Carlisle-street, Splott, and Cowbridge-road, Canton, are the architects; and the contractor is Mr. C. C. Dunn, Cowbridge-road, Canton. The total cost will be £1,000.

A stained-glass memorial window has just been placed in the church of St. Peter, at Tiverton. The figures in the four compartments represent Mary the wife of Cleophas, with her sons; in the fourth, Mary of Bethany and her sister Martha, with Our Lord; while the two middle ones are occupied by figures of Mary the mother of Jesus, and St. Mary Magdalene. In the tracery are angels, with scrolls bearing the word "Allelulia," as also shields with monograms. Mr. F. Drake, of the Close, Exeter, executed the work.

Works of water supply are being carried out for the local board of East Cowes, from plans by Messrs. Hems and Blizzard, of Southampton. The contractors for the well are Messrs. Jenkins and Son, and the contract for laying water mains is being executed by Mr. Green.

WAYSIDE NOTES.

MR. FREDERIC HARRISON is raising once more the cry of a great municipal palace for London. It would be something stupendous if he could have his way, and worthy of the first city in the world. So it would, his opponents urge, if the County Council had the secret power of some of those genii of the "Arabian Nights," who could command inexhaustible riches, without needing to have recourse to the ratepayers. Mr. Harrison wants a commission of experts sent upon a roving commission across the Continent of Europe to study and report upon the municipal arrangements of the great European cities. A pleasant holiday, doubtless. Perhaps the Society of Architects could manage it if the L.C.C. would oblige with a grant, and embody their experiences in a special number of their *Transactions.* The building of a fitting municipal hall and offices is certainly one of the first of London's requirements—not merely for appearance sake, but because, as Sir John Hutton recently showed, it would save London money in the long run. The London County Council's rental increases yearly, and still its accommodation is insufficient.

A serious accusation is made by a writer in the current number of *Goodwill:* "There is not a single church and school furniture manufactory that I know of which can be termed a fair house. They all pay very low prices, and have the work mostly done on the worst possible system of lump work." Commenting on this, the writer adds: "We seem to be getting worse and worse. We now, apparently, in many cases, have the following anomalous state of things in church: A parson clothed in a 'sweated' surplice and cassock, standing in a 'sweated' pulpit, preaching about 'loving your neighbour as yourself,' and calling the workers of his congregation his 'beloved brethren,' the said congregation being clothed in 'sweated' shirts, trousers, and other garments, and seated on 'sweated' chairs, finding the text in 'sweated' Bibles, and 'about to be sweated' from Monday till Saturday when they have left the church! I wonder what Isaiah or St. James would have to say on this!" The statement is exaggerated; but there is, I think, certainly *some* foundation for it.
